Changes to archaeological practice may shape methods or techniques, for example, something as prosaic as identifying new kinds of sites or landscapes to examine. In one case, investigators were encouraged to think about their research problems spatially rather than temporally – a major methodological shift that helped them to better understand how to tackle a complex regional history. The researchers also learned a great deal about local concepts of ethnic-group belonging that were grounded in theories of identity very different from those traditionally used by social scientists (Green et al. 2003). Multiple cases also demonstrate that engaging with communities permits archaeologists to envision an ethics that is situational without being relativist. These examples reinforce Yvonne Marshall's argument that "Community archaeology represents an opportunity. We need it, not because it is politically correct, but because it enriches our discipline." And furthermore, that examples such as those hinted at above should "change the perspective that community archaeology is simply a CRM [Cultural Resource Management] or heritage management issue and of little relevance for academic research" (Marshall 2002a: 218, 215).

One of the factors militating against the closer integration of academic researchers and communities is the structure of the academy itself. For although engaged scholarship can be intellectually complex, theoretically grounded, and rigorously executed, the standards for assessment are less obvious than with the traditional process of publication for peer review. Without metrics in place for evaluating the quality of community engagement projects in archaeology-or any other discipline – and thus the assurance that such work "counts," these endeavors can seem risky to scholars whose careers are not yet established. One reason to hope for change sooner rather than later is that many universities, while uncertain how to handle engaged scholarship on the part of their faculty and staff, aggressively promote its importance for students (though a casual

examination suggests that this trend is more pronounced among institutions in the global North).

It may be that the imperative to provide quality training for the next generation of practitioners will have the unintended consequence of encouraging engaged scholarship at the research level. "Recent developments in archaeological practice [including openness to community engagement] have led to the recognition that training archaeology students poses new challenges as the discipline attempts to meet the diverse needs of the twenty-first century" (Nassaney 2009: 4).

Community Partnerships in Safeguarding World Cultural Heritage

Richard A. Engelhardt
UNESCO, Bangkok, Thailand

C

Introduction and Historical Background

The Interface Between Conservation and Development

Over the past four decades many, if not most, developing countries have experienced unprecedented economic prosperity brought about by strategies based on capital investment in infrastructure for industry, agro-business, urban renewal, and tourism. These strategies mirror those adopted by developed countries in previous decades. However, like in the developed economies, these strategies have exacted a heavy toll on environmental and cultural resources. The damage to environmental resources has for some time been recognized and is a matter of public concern and debate. More recently it has been recognized that there is also an alarming depletion of the common stock of cultural capital. Adding to the urgency of the situation are the accelerating forces of globalization which promote the homogenization of cultures and the degradation of the socioeconomic relevance of cultural heritage, both tangible and intangible. In spite of our emotional attachment to the past, our heritage resources are fast disappearing at a rate unprecedented in history.

Cultural resources – when they have been considered at all within the development paradigm – have typically, but incorrectly, been seen as permanent and, therefore, inexhaustible. This has been true especially of built culture heritage: archaeological sites, ancient monuments, and historic buildings are regarded as permanent fixtures of our cultural landscapes. Nothing could be further from the truth. Cultural resources, particularly the built cultural heritage, are nonrenewable resources, each a creation of a specific time and place, now past. These resources are under constant threat of degradation, dismemberment, disintegration, and disappearance.

In spite of the public's avowed devotion to our cultures, misuse and abuse culture heritage resources are rampant. This is obvious to anyone who has seen the graffiti, trash, and vandalism at an ancient monument. This is obvious to anyone who has been unable to experience the serenity of a mosque, church, or temple because of the noise pollution and uncontrolled crowds. Yet, when the overexploitation of a culture heritage resource becomes so unbearable it cannot be ignored, the most common response is to transfer responsibility for this situation to the local inhabitants by citing their somehow lax stewardship and to put severe restrictions on their use of the site and its resources. In the most extreme scenario, local populations have been relocated out of protected areas altogether. Historic districts have lost their traditional inhabitants and have been repopulated with more economically profitable tourists. This strategy, however, only hastens the deterioration of the heritage through the loss of traditional custodians and endogenous techniques for sustainable management of the heritage.

It is obvious that urgent, strategic, and comprehensive action is required to protect a community's and the world's culture heritage assets. In the early twenty-first century, we are operating with a new and much expanded understanding of what constitutes our heritage and so there is the need for a marked shift in the way we manage our cultural heritage resources. Culture heritage conservation must be integrated into strategies for sustainable development, taking into account the needs and aspirations of the communities where cultural assets are found.

Only through community stewardship of the heritage can it be ensured that the heritage will be protected everywhere, and that its protection will be sustained over the long term. Sustained, universal stewardship is prerequisite for the survival of cultural heritage.

Key Issues/Current Debates

Community-Based Conservation Requires a Systematic Approach

Sustainable heritage conservation depends upon the commitment and involvement of local communities. Conservation policies, if they are to be successful, need to promote local community stewardship of the heritage as well as provide socioeconomic benefits for local communities. Therefore, a direct link must be made between the safeguarding of the heritage and socioeconomic development.

Heritage conservation must be anchored in the institutions of the local community and local populations must be given a leading role in the development of conservation policy, as well as in the management of culture heritage sites. Unfortunately, because of the decoupling of heritage conservation with development, community action has become the weakest link in the chain of conservation.

Therefore, the development of the capacity of local government, community-based institutions, and nongovernmental institutions to successfully manage their heritage resources for both conservation and development is a global priority.

The basis of such a strategy to empower local communities in heritage conservation is to be found in a series of participatory and catalytic activities that spur local interest groups to assess the nature, characteristics, and economic potential of indigenous resources and then to develop these resources in ways that are both profitable and sustainable. In the process, local communities are empowered to take more active role in the management of their heritage and in the development of culture tourism-related industries that can alleviate poverty, finance the conservation of local heritage on which tourism is based, and enhance living conditions:

- The first objective of such a strategy is to empower individuals in and local communities as a whole to understand and advocate the long-term conservation of the heritage in their communities. For this purpose, traditional community leaders are mobilized and traditional consensus-building mechanisms are used within the community to arrive at a shared vision and a common goal.
- The second objective of empowerment is to enable the local communities to play a leading role in actual hands-on conservation and preservation work, such as monitoring the

condition of the site or taking part in preventive conservation and ongoing maintenance and restoration projects.

- The third part of the empowerment equation is to develop the means through which local communities can benefit financially from the enhanced conservation of the heritage while at the same time maintaining their social and spiritual traditions intact. Activities here involve a wide variety of income-generating and self-employment opportunities, such as support to the expansion and mass marketing of traditional handicraft industries.

Project activities will differ from site to site, depending on site problematics and assessed needs. However, there is a common strategic ten-step sequence, which when followed, gradually leads to community participation and competence in the maintenance, management, and development of their heritage. This structural framework of activities provides a model which makes the experience sites replicable and transferable to other communities elsewhere in the region and, indeed, worldwide. The sequential activities are as follows:

- Step 1 Activities which promote a stewardship ethic and community participation in historic conservation
- Step 2 Hands-on training involving local town and neighborhood managers to develop gazetting, zoning, and environmental management plans for both preservation and development of historic sites
- Step 3 Training and support activities to identify pilot projects within the community through community-based participatory research work
- Step 4 Research, development, and training in low-cost, traditionally appropriate, and historically accurate techniques for building maintenance and restoration
- Step 5 Reviving the use of traditional building and associated trades necessary for the maintenance of historic buildings in an authentic manner
- Step 6 Promotion and training to preserve artisan skills and other intangible cultural activities which have potential market appeal and can be developed into income-generating professions
- Step 7 Training and promotion of community-based and community-controlled tourism industry-related occupations grounded in the accurate interpretation of the unique local culture, history, and environment
- Step 8 Assistance in curriculum development for both formal and nonformal education in local history, heritage conservation, and small business management skills in the culture industries
- Step 9 Assistance to avail of revolving soft loans and micro-credits for conservation, maintenance, and business development
- Step 10 Creating networks for the exchange of technical information among site managers and town planners.

International Perspectives

Case Studies Provide the Management Prerequisites for Community-Based Conservation

To be successful, a community-based program for conservation must be people centered, focused on local community participation. Activities relative to heritage management and development should be carried out by the local stakeholders themselves at the village level and not by outside parties who siphon off much of the generated income that is meant for the heritage custodians. To ensure this, it is essential that individuals, informal groups, or people's organizations that play traditional roles in the maintenance of heritage sites should first be identified and then work with them, through them, and assist them build up their managerial and technical capabilities.

Given the lack of financial resources and support mechanisms in many countries, it is important that pilot sites have (1) strong private sector involvement in heritage conservation and management, (2) facility to provide micro-credit schemes, and (3) local policy makers are willing to set up required legal frameworks for heritage protection. Implementation strategies should aim at sustainability and replicability of activities that

can result in multiplier-effect or spin-off projects in other target heritage sites.

To complete this strategic scenario, incentives and other forms of recognition should be put in place in order to encourage local community participation and to counteract the perceived negative effects of conservation vis-à-vis modernization and economic progress.

In the ten-step strategy outlined above, it is obvious that there will be growing demand for technical and managerial expertise at the grassroots level and management tools to implement this expertise in a practical way. Among these tools are the following.

Establishment of Information Networks

Fostering, facilitating, and strengthening the communication and lateral links between heritage site managers themselves and with other professionals in their field are one of the priority strategies. It is a goal of the program to provide and foster the means whereby site managers and communities can learn and share from each others' experiences.

Heritage Conservation Awards

The *UNESCO Awards for Culture Heritage Conservation* were established to recognize the achievement of individuals and organization within the private sector and public-private initiatives, in successfully restoring and adapting for viable reuse structures of heritage value in the region.

Promotion of Responsible Tourism

Resulting from many requests from site managers and tourism industry personnel for guidelines and real-life examples of sustainable tourism practices, case studies exploring issues of tourism and culture preservation need to be undertaken and guidelines on cultural tourism for heritage managers, tourism industry personnel, and site visitors.

Heritage Homeowners' Manuals

Designed as a practical tool to guide individuals and families in the care, renovation, and possible adaptive reuse of their historic houses, *Heritage Homeowners Manuals* return responsibility for home (or shop, or temple) maintenance back into the hands of the owners of these buildings themselves.

The purpose of such manuals is not to turn every homeowner into a professional conservation architect but to guide building owners in accomplishing those tasks of routine maintenance and preventive conservation, which are clearly within their competence and responsibility. The *Heritage Homeowners' Manuals* provide the technical guidelines necessary for owners to carry out the necessary work in a manner that preserves the historic authenticity of the structure.

Future Directions

UNESCO-ICCROM Academy for Culture and Heritage Management

There is a rapidly increasing demand for improved professional management of both tangible and intangible culture heritage resources and the institutions that safeguard and foster them. The recently established UNESCO-ICCROM Academy for Heritage Management is the response to meet this need in a professional, systematic, sustainable, and cost-effective way. The Academy is not a physical structure. Instead it is a network of institutes of higher learning that are engaged in the research and teaching of some aspect of heritage conservation and/or culture resource management. The specific focus of the Academy is on management training, but within that focus, the range of institutional members is wide and the management training they offer is broad covering all aspects of culture protection, development, and management. Included in the Academy are institutions that teach culture protection and intellectual property law, culture industry management, culture institution management (museums, theaters, art galleries, dance companies, music groups, etc.), human settlement planning, architecture and architecture conservation, archaeological and protected site management, and tourism, to name but a few of the many aspects of culture management covered by the Academy.

For many members of the network, the high local demand for heritage site managers has been the entry point into the field. However, the Academy pointedly and actively promotes a holistic approach to culture resource and institution management, which emphasizes legal protection for both tangible and intangible cultural expressions, as well as the integrated management of the entire scope and diversity of cultural resources with a view to their role in the paradigm of sustainable development.

The main activities offered by the Academy consist of (a) formal postgraduate training, leading to M.A. degrees in management; (b) short certificate courses in specific management skills; (c) joint field schools where the different fields of culture resource management are brought together; (d) seminars and workshops for in-service professionals to renew and update their professional knowledge; (e) collaborative research and publication; (f) accreditation and licensing; and (g) distance-learning (Web-based) extramural diploma courses for mid-career professionals.

The Academy network organizes field schools that offer in-service professionals, advanced students, and staff from institutional members the opportunity to study heritage conservation in real-life situations with the guidance of leading experts in this field. The field schools also facilitate exchange between members and serves as a platform to discuss current professional issues in the field of conservation management of the region's cultural heritage. Field schools include flagship field school, which are co-organized and cohosted by local institutional members, UNESCO and ICCROM, and focus on issues directly related to integrated management. Institutional members also organize affiliated field schools which focus on training about a specific topic. The Academy Field Schools and affiliated field schools are planned within a coordinated framework in order for diverse field schools to complement each other and to address needs within the existing regular program curricula offered in the region.

Hoi An Protocols for Best Conservation Practice

Experts in conservation from and/or working in the developing work specialized in the various fields of archaeology, architecture, urban planning, and site management met in Hoi An, Vietnam, in early 2001. The conservation experts convened to discuss the establishment and promulgation of regional standards of best conservation practice which will assure that the values inherent in the heritage sites are safeguarded and that their authenticity is preserved and truthfully explicated during the process of conservation, restoration, rehabilitation, and subsequent use and maintenance. The workshop resulted in the development of the Hoi An Protocols for Best Conservation Practice. The types of heritage sites explicated in the Hoi An Protocols include archaeological sites, both excavated and unexcavated; monuments and other standing structures, whether ruined or intact; buildings and other structures of historic or other cultural, social, economic, political, or ideological significance; architectural ensembles, historic urban areas, and townscapes; landscapes and environments of historical, cultural, and/or socioeconomic significance; and underwater cultural heritage sites.

The Hoi An Protocols provide site-specific methodologies for assessing five categories of heritage sites: (a) cultural landscapes; (b) archaeological sites; (c) historic urban sites and heritage groups; (d) building, monuments, and structures; and (e) underwater cultural heritage sites. The Hoi An protocols incorporate guidelines for (a) inventorying of tangible and intangible cultural resources; (b) identification of threats to cultural authenticity; (c) establishment of indicators, measurement, and modeling of impact; (d) use of professional mitigation tools and negotiation procedures/strategies; and (e) community-based evaluation.

Cultural Impact Assessments

The majority of legal regulations which exist focus on protecting the cultural heritage, through the designation of landmark status, restricting

alterations to the property, and limiting the involvement of the property owners or managers in deference to government conservation professionals. While this process highlights the significance of the property, it restricts the ability of owners or managers to flexibly maintain or adapt the properties to more viable or sustainable uses. This may negatively detract from the ability to conserve the property sustainably. At the same, it restricts the ability to develop the property or its surrounding area.

Introducing a system of cultural impact assessment will allow for a more balanced approach to ensuring proper conservation while at the same time accommodating development. Over the past 30 years, environmental impact assessments have gradually been incorporated into the project feasibility and loan evaluation process of multilateral and domestic project financing. There exists a similar need to evaluate the potential impacts of investment and implementation, particularly of large projects, on both tangible and intangible cultural resources. Through the development and testing of cultural impact assessments, the goal of sustainable development can be extended from the ecological realm to the broader societal milieu, incorporating the existing built heritage, living traditions, and socioeconomic needs of local communities and sites.

With the cooperation of the World Bank, the regional development banks, and other international and national financing partners, systematic undertaking of cultural impact assessments can be mainstreamed into standard procedure for evaluating the impact of large infrastructure development projects at culturally sensitive and/or vulnerable sites.

Conclusion

The preservation of the heritage is an undertaking of such scope and long-term commitment that it can only be successful if there is active participation by local communities everywhere. By focusing on local ownership of heritage and local control over its preservation and future use, heritage conservation can claim its rightful place at the center of human development.

The purpose of community-based heritage conservation is not to encourage people to return to some nostalgic past, but rather to use heritage as the divining rod for determining the direction each community wishes to take in its future development. This will help to ensure that the end result of development efforts will be acceptable and appropriate to each community's economic needs and respectful of each community's social and cultural values.

Comparative Urbanism in Archaeology

Monika Baumanova[1] and Benjamin N. Vis[2]
[1]Center for African Studies, Department of Middle Eastern Studies, University of West Bohemia, Pilsen, Czech Republic
[2]Independent Researcher, Herne Bay, UK

Introduction

Urbanism, its origins, form, and characteristics, is a pivotal subject of interests in archaeological investigations. The theme of urbanism has played an active role in the (re)definitions of theoretical paradigms, methodological advances as well as in explaining some of the large-scale transformations in the human past. The significance of the study of urbanism was originally established through regional foci on the Near East and Europe, especially Mesopotamia, the Greek Polis, and the Roman Empire. Thanks to broadening its scope over time, and the increasing availability of archaeological datasets with improving quality, coverage, resolution, and analytical rigor, the archaeology of urbanism now progressively reveals the great variety of urban form and life that has populated the globe throughout human history. Cities and urban landscapes constitute a determinant factor in the development of many more regions than previously thought. Urban societies emerged independently and flourished in highly diverse cultural, social, economic, political, and environmental conditions (see further reading, e.g.). This is now known to include most of the Global South, while before the importance of urbanism in, e.g., sub-Saharan Africa, Central-, and North America was often denied or diminished in scientific discourse. Recently, these previously marginalized regions started to inform urban studies both within and beyond archaeology. With the growing number of case studies emerging around the world, archaeologists have begun to juxtapose evidence on ancient urban settlements and processes of urbanization. Consequently, comparative approaches are regaining importance, because systematic and intensive comparison of equivalent data enables and enhances knowledge production on the socio-cultural, functional, and environmental characteristics of urbanism both in individual cases and across regions. In this way, comparative urbanism facilitates the recognition and articulation of cross-cultural patterns and caters for discourse shaped by urban analysis and interpretation that is directly relevant for the understanding of societies and human-environment relations in the past, as well as processes and possibilities in the present.

Due to a persistent trend of rapid urbanization, the twenty-first century is regularly referred to as the urban century. Along with a rising global population, the urgency associated with the scales of this developmental trend is such that current challenges are often only captured in "recentist" frames of reference, disregarding millennia of similar scenarios that have shaped this phenomenon. Comparative urban archaeology is acutely relevant to elucidating the transformations, experience, and social-ecological performance of cities over the long term and the outcomes of urban developmental responses across the widest possible variety of cultural and environmental settings. Achieving greater levels of sustainability requires rigorous insights into the resilience, adaptability, persistence, and reinvention of urban practices as accommodated by spatial-material land-use configurations and the potential of such configurations to facilitate urban life locally and to revise global social-ecological relations. The archaeology of comparative urbanism has a key role to play in the critical contextualization and anticipation of long-term effects of design strategies for sustainable urban development and agendas that guide equitable and ecological urban growth.

Definition

Comparative urbanism has hitherto not been treated as a distinct field in archaeology but can be recognized as a recurrent research aim and

practice. It builds on those lines in archaeological research that promote answering "big questions" on major trends in the history of humankind. The basic principle holds that we can infer meaningful patterns in material culture that afford and affect processes in the human past. In the case of comparative urbanism, this refers to evidence on, broadly conceived, intensively developed environments designed, built, and inhabited by humans. Contrasting samples of intensively constructed landscapes, architecturally developed areas, or entire towns reveal and articulate differences and regularities in urbanism's societal role and cultural purpose, the shape, structure, and lived experience of urban life, the social-ecological responses and functions of cities, and the developmental trajectory and endurance of settlement. The study of urbanism in archaeology is inherently multi-scalar. Investigation relies on the collection and analyses of material evidence on landscapes and settlements. This evidence permits the determination and explanation of the presence, distribution, formal characteristics, delimitation, performance, and experience of cities and urban life. Comparative urban studies in archaeology are principally centered on what remains of intense socio-spatial investments in structuring land for inhabitation with architectural and infrastructural elements.

Material evidence on such socio-spatial investments comprises spatial-material features, mobile features (especially artifacts), and ecological features (derived from bodies, chemistry, and biology). Spatial-material features include all elements of the built environment and frequently also the landesque capital of anthropogenic landscapes, which may be more or less tangible or materially persistent (compare, e.g., stone buildings and tents), but all represent spatial concentrations of social complexity. Techniques for analyzing spatial-material features are particularly developed for urban settings and can regard building materials, construction techniques, stylistic analysis of architecture, functional characteristics, and especially structural and spatial organization. For the study of urban settlement, sample collection of mobile and ecological features concentrates on the spatial concentrations of social complexity, such as within architectural structures, across built-up areas, and covering their hinterland. Built environments are a ubiquitous source of information on cities and play a major role in structuring the functioning of cities. Built environments respond to social-ecological conditions and act on and, through time, react to human sensory and emotive perception. This intertwined constitutive relationship affects cultural interpretations of how built environments afford social behavior and development (Barth et al. 2012). More recently, it is also widely accepted that studying the "open" space that makes up the voids that bind spatial-material features and individual buildings into intensely settled constellations is materially inextricable from the experience and functioning of urban life. The significance of urban open space is now regularly incorporated in archaeological research on urbanism (see further reading). All material evidence combined forms the information resource that allows urban archaeology to formulate and substantiate overarching arguments on urban planning and governance by appreciating what results from policies, social acceptance, and tolerance.

Comparative urban research can evoke the entire gamut of analytical dimensions in comparative archaeology (see Smith and Peregrine 2012). Comparative urbanism is distinct from buildings archaeology and most architectural studies in that it is predominantly not concerned with the classification, style, and construction of single buildings or architectonic complexes. Instead it focuses on the social and spatial coherence of representative parts of or entire urban settlements, on intra- and inter-city scales, within one region or across geographical locations and conditions globally, within one culture or across cultures, in synchronous or diachronic modes of investigation. Regardless of whether the methods used are primarily suited to an intensive or systematic comparative strategy, the aim is to identify and elucidate patterns of difference and similarity and to derive insights into the nature of regularity and equivalence across selected cases. The nature and qualities of any comparative study of cities will depend greatly on data availability, the

commensurability of methods, and the category of questions it aims to answer, involving higher or lower levels of detail, social intricacy, and cultural meaning. The efficacy and potency of comparative urban research rely heavily on the overall research design (Vis 2018). Through a comparative lens, we enable a specific perspective that relates any two or more sets of built space or urban effects within predetermined limitations. Since there is no single way to do comparative urban archaeology, cogent research specifies how the precise approach is adjusted according to the research questions, the local or set conditions, and the targeted characteristics of the accessible data. In this way, we may consider towns with a similar economic function (e.g., trade posts) or cultural ascription (e.g., Islamic towns), even if they did not have any prior contact with one another, to see whether and what similarities their street layout and distribution of buildings displays (e.g., Baumanova et al. 2019). The next step in these comparisons might then be to explain how the observed patterns could have originated and what they mean. In practice, diachronic analyses that would enable tracing and comparison of the processes by which a city developed are often hampered by the fact that the next phase of urban construction usually obliterates the preceding material situation. Furthermore, urban archaeology in municipal heritage management contexts tends to yield highly fragmented data that offer selective windows onto past situations, pragmatically delimited by requirements of the present. Even when there are sufficient data available, adequate analytical constructs and frames of reference for radically inclusive ancient-to-modern comparisons are as yet scarcely available, especially beyond natural scientific approaches (cf. Chase and Scarborough 2014 and Carballo and Fortenberry 2015).

Historical Background

Urban settlements have been a focus of archaeological investigation since the antiquarian tradition of the nineteenth century. However, the maturity of thinking about urbanism emerged when comparative approaches enjoyed widespread popularity in archaeology, not least as supported by the disciplinary paradigms of culture history and processualism. In the first half of the twentieth century, Gordon Childe developed several publications that found a large audience within and beyond archaeology. He coined, among other influential propositions, the notion of the "Urban Revolution." The term reveals a strongly felt preoccupation with the ability to define the essential nature of what a city is and the ability to pinpoint when the characteristics of urbanism first emerge in large settlements. The strand of research concerned with the origins and classification of cities followed influential geographical and sociological thought from theorists like Max Weber, Louis Wirth, Gideon Sjoberg, Lewis Mumford, and Richard Fox which promote ideal-type constructs and trait-complex approaches to define and categorize cities according to functional or historical types. Such classificatory notions make productive tools for comparisons. The origins of urbanism have also captured the attention of geographers. Contrary to Childe's frequently substantiated model that agricultural surpluses precede the emergence of urbanism, the popular, but unsubstantiated model proposed by Jane Jacobs that puts cities first, is often cited outside archaeology.

The relatively coarse nature and limited coverage of the available data on ancient cities and urban landscapes meant that alongside trait-complexes, in the following decades much work on urbanism regarded inter-city-level settlement patterns taking cue from ideas such as environmental determinism and central place theory. Popular approaches include size rankings, site catchments, and other quantitative spatial distribution analyses, which is very much in keeping with the general "scientific turn" that characterizes archaeology in the 1960–1970s. The leading notion held that in order to allow for comparisons, researchers should agree on certain behavioral and evolutionary developmental patterns that humans and possibly all societies have in common, at least when facing similar economic and environmental constraints. Nonetheless, publications in the 1970–1980s show significant variety among

approaches to studies of settlements and urbanism, with interpretation of high-level meaning through hermeneutic and semiotic lenses soon appearing alongside established formal and quantitative methods. For the development of comparative urbanism in archaeology, the work of Paul Wheatley is noteworthy. He not only reviews the variety of theoretical strategies toward urbanism but is himself a strong proponent of including perspectives on urbanism from non-Western areas in Asia and Africa. Wheatley's stance is reflective of the fact that both trait-complexes and quantitative and economic models had predominantly been derived from examples from Near Eastern and Classical Antiquity. Both approaches have remained influential in urban discourse throughout the meaning and context-oriented postprocessual archaeology in the 1980–1990s and beyond, inspiring new and more nuanced approaches. For example, Michael E. Smith (2017) recently proposed a polythetic set of attributes to determine the intensity of urbanism comparatively, while energetics continues to inform analyses of material and labor investments associated with the monumentality in cities as well as urban scaling laws applied to archaeological evidence (Ortman et al. 2014).

Drawing on critical social theoretical concepts and grand societal narratives, postprocessualism saw an increase of interest in social organization, meaningful events, and the role of individual agents, emphasizing sensory perception, phenomenological experience, semiotic and hermeneutic interpretation, and behavioral psychology. In this way, while the paradigm stressed sensitivity to individual contexts and therefore did not favor the generalizing tendencies of preceding approaches, it enriched comparative studies of urbanism in archaeology nevertheless. The methodological and data requirements of these alternative vantages have encouraged experimentation and development of new methods, especially with regard to modelling and interpreting social experience, spatial cognition, and sensory perception (e.g., Creekmore and Fisher 2014, see further reading). Initially critiqued for being individualistic and subjective, postprocessual interests now regularly blend into innovative computational approaches. Many lean on cognitive science, neuroscience, and actor-network theory to refocus questions on universal human responses, bodily capacities, and cultural variability, be that with greater sensitivity for a more comprehensive and inclusive set of norms and values that reflect different lifeways.

The comparative perspective on urbanism in archaeology today is, without question, reinvigorated. This emanates from the large number of recent volumes that gather diverse case studies on ancient cities and urbanism, displaying an array of methodological approaches (e.g., Creekmore and Fisher (2014) and Yoffee (2015), see further reading). Many of the featured scientific and interpretive approaches are derivatives of other disciplines in the environmental, social, and humanities domains. These collections of essays cut across urban research themes featuring cultures across the world, but their selections also reveal divergence in the concerns, convictions, and inclinations of their editors. Most of all, they are witness to the increasingly good quality and coverage of data on urbanism that is now available to archaeologists, progressively enabling direct dialogues with contemporary urban studies and affiliate disciplinary discourse. Nonetheless, few contributions tackle cross-cultural urban comparisons head-on, and, equally, most volumes treat ancient urbanism separate from present-day cities and urbanization. This may be an indication that the richness and diversity of data and the particularity of cultural specialisms of individual cases have become so complex that we lack appropriate frames of reference, data models, and commensurate methods to design sufficiently rigorous comparative urban research (Yoffee 2009; Vis 2018). This state of affairs also highlights the urgency of data sharing and collaboration to effectively address the big urban questions.

Key Approaches/Current Debates

For archaeology to play a pertinent role in the understanding of society-space relations, contextualizing international development, and influencing current concerns in urban studies in general,

rigorous comparative research is essential. Only through comparison can we evaluate and consolidate the insights on any individual urban settlement by relating it to the global context of the continuing phenomenon of urbanization. Applying urban comparisons with appropriate research designs, employing commensurate data structures and analytical concepts, enables us to address key urban questions through archaeological research. These questions lead investigations into the scales, characteristics, rhythms, and effects of urban transformations that took place over the long term. Comparative analyses pursue understanding of the essential differences and similarities in urban forms and lifeways across diverse regional settings, cultures, societal organizations, and environments. Big urban questions also require that we elucidate and critically contextualize divergent and recurrent urban trajectories in human history.

Detailed archaeological studies of urban life and environments can be very costly. They regularly involve destructive and extensive test-pitting and surface excavations, while the diversity of material evidence and richness of assemblages can require a host of laboratory tests and intensive post-excavation analyses to establish chronology; to unravel complex stratigraphies; to understand climatic conditions and events; to determine diets and subsistence; to infer social strata, demography, and governance; to recognize the functioning of trade and redistribution; the societal exposure to external ideas and influences; etc. Where urban archaeology concerns pasts of cities that continue to be inhabited and developed, archaeological research is typically dependent on the opportunities that are generated. Excavation may only take place along new construction, creating undesirable fragmentation of data and understanding. Meanwhile the local political situation concerning urban planning and heritage management policies may prevent archaeological research from taking place at all. In other instances, heritage management strategies may favor consolidation over excavation, as is the case in Mexico, preventing the acquisition of data on its development and planning history even where ancient cities have been abandoned. Alongside excavation, the (spatial) data collected through topographical surveys and mapping, surface collection through field-walking, or remote sensing (including geophysics, aerial, and satellite imagery) has proven highly revealing and analytically productive over the years, especially as technologies such as Light Detection and Ranging (LiDAR) have matured. These types of data complement the detail of excavation at varying scales and position evidence and analysis in different frames of reference. Also, when excavation and sampling activities are unattainable for any reason, spatial investigations using noninvasive techniques may still allow archaeological work on urban questions. In addition, secondary analyses of archived maps, historical records and cartography, and legacy data from previous projects can serve the purpose of urban comparisons in archaeology (e.g., Vis 2018).

Analysis and interpretation in comparative urbanism are not without controversy. While cities seem almost infinitely complex, it is a feature of any comparative approach that a level of simplification or generalization is needed in order to enable direct comparisons using the same terms. On the one hand, the empirical and material nature of evidence in archaeology is more suitable for certain quantitative generalizations, such as analyzing spatial patterns, on the other, as regional and cultural specialists, archaeologists chiefly focus on single or particular sets of cases. In urban studies, contemporary comparative urbanism has been critiqued for favoring the particularities of individual cases (Scott and Storper 2015; Vis 2018), which is echoed by the juxtaposed chapters in major volumes on ancient cities in archaeology. Likewise, because comparative studies cannot be expected to include all examples of a phenomenon in their selections, there is an issue with generalization through representation in sample selection. Selected cases usually act as a pars pro toto for wider occurring phenomena, or there is an assumption that the selected data under investigation are capable of representing or expressing a particular meaning, such as building types reflecting function or spatial configurations reflecting actual behavior and events.

Population is a crucial variable that enables comparative urban research. Geographic and demographic size and complexity doubtlessly matter in current investigations into early urbanism and questions around megasites in Eastern and Central Europe, the Near East, and North America (e.g., Krausse and Fernandez-Götz 2017 and Bernardini and Schachner 2018). The imprecision of population estimates continue to be a challenge, while reconstructing demography is fundamental to questions on settlement size, urban nature or origins, social complexity, demographic composition and change, sustainability, monumentality, etc. Population estimates follow from ways that a number of people can be extrapolated from evidence that approximates a population, such as human bodies, volumes and assemblages of artifacts, number of architectural structures or residences, areal extents of sites, floorspace, and roofed space, ethnohistorical family units, and calculating the environmental carrying capacities from agricultural yields (see Currie et al. 2015 and Drennan et al. 2015).

Each city is irrefutably unique, but comparisons depend on exploiting common references, dimensions, and categories in data on cities and urban landscapes. Finding theoretical stances that are bound to material evidence and give rise to methods of analysis and interpretation that balance commonalities without overly reducing the individual particularities that give each city its intrinsic characteristics is the overriding challenge for comparative urbanism (Vis 2018). In accordance with archaeological interpretation elsewhere, social inference of urban life results from empirical observations of physically constructed spaces, their shapes, context, configuration, and the artifact assemblages they contain. The potency of comparative urbanism depends on the balance between analytical reduction and interpretation, resulting from how sociocultural and socio-ecological contexts and relations interlink with measured or calculated quantitative observation.

While the urban data collected in archaeology is quite particular to the discipline, the concepts and analyses employed for its understanding often derive from other disciplines. Smith (2011) gives a particularly useful account of the range of methods derived from what he terms "empirical urban theories" with successful applications to a variety of urban cases and situations. Among the most popular is undoubtedly space syntax (Hillier and Hanson 1984). Space syntax provides a theory and tools for spatial (ground plan) analyses at the level of the internal arrangement of individual buildings or entire settlement layouts. The quantitative output from graphs and associated probabilistic measures offer values that are easily compared with one another. Network analysis provides a similar approach to modelling spatial data on cities. When applied to the layouts of towns, streets are understood as edges (links) between individual nodes, e.g., buildings. Following social network theory, this approach allows archaeologists to create schematic layout plans which can then be analyzed using various algorithms to produce, e.g., measures of centrality based on connectivity, which may not correspond with the topographical center on a geographical map. However, these kinds of quantitative analyses make assumptions about the nature and comprehensiveness of the spatial data input, reduce interpretations in quantitative fashion, and the data modelling requirements can limit comparative applicability and suitability.

Approaches where abstract theoretical assumptions guide quantitative empiricism exist alongside the significant rapprochement between qualitative and quantitative reasoning, coming from integrating phenomenological and affordance reasoning into landscape and spatial archaeology. These philosophical ideas innovate geographical information system (GIS) and virtual reality (VR) analyses to address the sensory and social experience of acting in and inhabiting urban environments (e.g., Richards-Rissetto 2017, Vis 2018, and Baumanova et al. 2019). Generative, discriminative, and agent-based modelling are being applied to understand the development and functioning of urban space. Modelling usually relies on arguments claiming that predictions from law-like formulas reflect social behavior accurately or that when empirical evidence matches predicted patterns, the social dynamics assumed by the model can be inferred to be responsible (e.g., Morton et al. 2014 and

Ortman et al. 2014). Urban developmental trajectories are effectively being addressed through comparative studies approaches concerned with urban resilience, vulnerability, path dependence, scaling, and settlement dynamics (e.g., Fletcher 2009, Chase and Scarborough 2014, and Carballo and Fortenberry 2015). Similarly, the social, ethnical, spatial, and governmental divisions of cities into distinct areas such as neighborhoods and districts form a vibrant area of comparative research as well as social inequality and segregation (e.g., Arnauld et al. (2012) and Carballo and Fortenberry (2015); see further reading). Interpretively these approaches reflect a growing dialogue between methods that elucidate top-down or bottom-up dynamics in cities. With growing bodies of applied examples, this tension in urban analysis is expected to spur on conceptual growth in archaeological comparative urbanism.

An International Perspective: The Tropical Global South

Urbanism in archaeology was initially strongly determined by representation of the Near East and Classical Antiquity. While cities in all parts of the world have been the object of study for several decades, in recent years, the archaeology of cities in the tropical Global South is especially exciting and revealing. Here we exemplify the role this area is playing in spurring on and promoting comparative urbanism in archaeology.

There are several reasons why archaeological urbanism in the Global South has recently arrived at the forefront of urban interests. First, data availability both in coverage and quality has reached a level on which substantive arguments with regard to urgent social and environmental scientific concerns can be made. Although certainly not exclusively so and comprising much internal variability, the visibility of archaeological urban landscapes in tropical climates often includes examples of abandoned and overgrown cities. This means the topography of these cities is partially visible on the surface, sometimes comprising entire landscapes. The development of remote sensing techniques and especially the recent application of LiDAR has now had sufficient sustained success at providing Digital Elevation Models (DEM) for tropical cities in astonishing detail at large scales. This is especially true for the Khmer cities in Cambodia (Evans 2016) and the urban landscapes of the Maya culture area (Chase et al. 2016). Urbanism in sub-Saharan Africa had not been seriously studied until the 1990s, but now archaeologists document fully fledged urban societies in Mali (Jenne-Jenno and Old Djenne), East Africa (e.g., Swahili city-states, the Great Lakes), Zimbabwe (Great Zimbabwe), and others. What binds these geographically disparate examples is a history of colonialism and globalization. The normative bias toward Western and globalized notions of urbanism significantly downplayed the significance of indigenous forms of urbanism, denying tropical archaeological cities an urban status. Because these settlements show patterns of built form that are radically different, the failure to recognize them as urban diminished the comparative understandings that could be generated. Current appreciation of the evidence acknowledges that newly formulated concepts and descriptors are required to adequately capture their cityness. Replacing the inappropriate suggestion of cities comprised of "urban sprawl," the notion of "low-density agrarian based urbanism" was coined (Fletcher 2009), but not universally adopted (though low-density urbanism is used elsewhere, Krausse and Fernandez-Götz 2017). Alternative terms that are being explored include "tropical- or dispersed urbanism" and "agro-urban landscapes" (e.g., Graham and Isendahl 2018). The comprehensive views of urban landscapes afforded by remote sensing are eliciting the introduction of concepts such as conurbation, polynucleation, peri-urban interfaces, and multicentered cities which resonate with discourse on contemporary urban development and emphasizes the indispensable role of non-urban inter-site space (e.g., Garrison et al. 2019). The discontent about the concepts and descriptors with which best to approach the coverage and growing variety of evidence on ancient tropical urban landscapes thus reinvigorates essential questions about urbanism and the controversy of comparability.

Unprecedentedly, the archaeology of the tropical Global South is opening up an archive of urban diversity and possibilities of urban life that previously went unimagined. These indisputable revelations unequivocally refute any thought that urbanism is unique to any particular trajectory of societal development. Alongside the step change in spatial data availability and our progressing grasp on tropical urban landscape configurations, the development of experiential and socio-spatial approaches is now burgeoning, opening new grounds for comparative analyses (e.g., Richards-Rissetto 2017, Vis 2018, and Baumanova et al. 2019). These developments anticipate the demand for new methods and associated analytical units that will be able to process the intricate and sometimes perplexing spatial data currently being generated. The conceptual and methodological advances in the wake of revealing tropical urban landscapes are adjusting comparative urban research. The tropical Global South requires new levels of comparative integration, which will further improve our ability to explain the diversity of urban traditions, understand their long-term performance, and evaluate the future potential of their developmental principles. From this vantage tropical archaeology also pushes cogent arguments for more inclusive approaches to comparative urbanism in global contemporary urban studies.

The Future Role of Comparative Urbanism

The future development of comparative urbanism in archaeology will likely see growth in rigorous combinatorics of measures and methods and their application to greater varieties of case studies, both cross culturally and breaking down temporal divides. This will enhance the field to generate more concrete and representative insights, which in turn lead to more influential dialogues with direct societal relevance. Many of the key approaches previously discussed, as well as conceptual innovation and data acquisition such as seen in the tropical Global South, are not settled and will continue to give rise to new perspectives, questions, and interpretations. We foresee that such developments will ensure that urban archaeology can play an accepted, recognized, and substantive role in comparative urbanism as practiced in urban geography and urban studies more broadly (see Smith (2009) and Robinson (2016) for portrayals of the field).

Urbanism promises to constitute an important area for "applied archaeology," that is the application of archaeological knowledge directly to practical problems perceived in the present (Isendahl and Stump 2019). As such – notwithstanding the immediate value comparative urbanism adds to understanding and appreciating cultural variety and the importance of urban heritage – comparative urbanism seems primed to address the role of archaeology in worldwide developmental issues as targeted by the social and environmental sciences. When archaeology can contribute data and frames of reference that can directly relate to discourse in other disciplines, archaeological comparative urbanism will be able to communicate its messages more cogently. The fact that the deep past reveals enormous cultural, societal, and environmental variety means that archaeology can contribute evidence on developmental trajectories that diversify urban scenario building utilizing insights derived from the performativity and possibilities of urban design and land-use. However, with the stakes and urgency of human development running so high, and global political and market pressures driving socio-technological "smart cities" that rely on multinationals, any archaeological place at the table is likely to remain hard-won. There are some early examples of the archaeology of urbanism that prove a useful lens on international development at peri-urban interfaces and that inform suggestions for adjusting global advisory planning policies to achieve food security (e.g., Barthel et al. 2019). These examples are generally framed in terms of principles and processes for improving sustainability, resilience, or adaptability in urban systems and their trade-off effects on global resources and equitability.

The efficacy of meeting this challenge for comparative urbanism in archaeology will largely depend on future scholars' ability to construct

appropriate analytical units and to continue to develop commensurate methods which will link archaeological evidence to present-day information on cities. For this to happen, archaeologists must engage in research communities where empirical methodological innovation takes place, such as in space syntax, urban morphology, actor-network theory, network analysis, virtual reality, sensory perception, and cognitive science. Subsequently, behavioral, social, individual, agent-based, and cultural information derived from the topography, morphology, and topology of the physical environment can successfully be integrated with the fine-grained specificities resulting from architectural studies, artifact and assemblage analysis, and ecological sampling. There is a potential for archaeological comparative urbanism to become for urban development, what paleoecology is to current climate change studies.

Complex Hunter-Gatherers

Kenneth M. Ames
Department of Anthropology, Portland State University, Portland, OR, USA

Introduction

Complex hunter-gatherers are hunter-gatherers whose cultures and societies have cultural, social, and economic traits that anthropologists and other scholars had long assumed required agriculture for them to develop. Permanent inequality is the trait that has attracted the most attention among archaeologists, but others include large, dense populations; large, relatively permanent settlements; and intensive economies among other characteristics. First widely recognized by archaeologists in the late 1970s, they have been a focus of major research efforts since. This research has been a testing ground for many theories about the origins and evolution of social complexity, especially of the origins and development of permanent inequality in small-scale societies.

Definition

At the most fundamental level, complex hunter-gatherers are hunter-gatherers who do not fit Richard B. Lee and Irven DeVore's characterization of hunter-gatherers in the 1968 seminal volume *Man the Hunter*, "We make two basic assumptions about hunters and gatherers: (1) they live in small groups and (2) they move around a lot" (Lee and Devore 1968: 11). They go on to list five additional characteristics of hunter-gatherers: first, because of mobility, the amount of personal property is kept low; second, the resource base keeps group size very small, below 50; third, local groups do not "maintain exclusive rights to territory" (i.e., do not control property); fourth, food surpluses are small to nonexistent; and fifth, groups are not strongly attached to "any single area." An additional characteristic not listed by Lee and DeVore here is that these small social groups are strongly egalitarian. These hunter-gatherers approximate stereotypes of hunter-gatherers that were widely held by scholars and others during the past several centuries. These stereotypes began to break down in the 1960s and 1970s as the great diversity among hunter-gatherer societies became clearer as a consequence of archaeological research. However, the *Man the Hunter* characterization does accurately describe some hunter-gatherer groups; those are labeled "generalized hunter-gatherers" in Table 1. Current definitions of complex hunter-gatherers often focus on trait lists of how they contrast with generalized hunter-gatherers (Table 1).

Certain attributes of complex hunter-gatherers are more central to our understanding of them than are others.

Demography and Group Size

Complex hunter-gatherer societies tend to have larger populations than do generalized hunter-gatherers. They also have higher population densities and larger communities. The significance here is that there are more people in daily face-to-face contact.

Corporate Groups

Generalized hunter-gatherer social groups beyond the nuclear family tend to be very fluid in their membership. Complex hunter-gatherers generally have stable, long-lived corporate groups, often in the form of households.

Residential and Mobility Patterns

Complex hunter-gatherers tend to be partially to fully sedentary. Mobility across and exploitation of the landscape tends to be logistical, a pattern in which long-term residential bases are established and task groups harvest and process resources at some distance from the base and return with the processed material. Generalized hunter-gatherers, in contrast, shift their residential bases as needed to position them close to available resources.

Property, Wealth, and Inheritance

Generalized hunter-gatherers usually consume resources as they are harvested, and while individuals may own objects they make or acquire, accumulation of property is usually repressed by social means. Among complex hunter-gatherers,

Complex Hunter-Gatherers, Table 1 Generalized and complex hunter-gatherer traits. (Modified from Kelly 1985)

	Generalized	Complex
Environment	Unpredictable or variable	Highly predictable or less variable
Diet	Terrestrial game	Marine or plant foods
Mobility	Residential	Logistical
Settlement size	Small	Large
Demography	Low population density relative to food	High population density relative to food
Food storage	Little to no dependence	Medium to high dependence
Social organization	No corporate groups	Corporate descent groups (lineages)
Political organization	Egalitarian	Hierarchical; classes based on wealth or descent
Occupational specialization	Only for older persons	Common
Territoriality	Social-boundary defense	Perimeter defense
Warfare	Rare	Common
Slavery	Absent	Frequent
Ethic of competition	Not tolerated	Encouraged
Exchange	Generalized reciprocity	Wealth objects, competitive feasts

consumption or use of harvested resources may be delayed through storage, and corporate groups and individuals own property which is transferred from one generation to the next. Recent research distinguishes among three forms of wealth: embodied (health, knowledge, skills), relational (social networks and ties), and material (things, beings) (Bowles et al. 2010). Among generalized hunter-gatherers, wealth is generally embodied or relational (Smith et al. 2010); among complex hunter-gatherers, wealth is also manifested through material wealth.

Subsistence and Economy

Subsistence economies are likely to be "broad spectrum," that is, harvesting a diverse array of resources, some of which are highly productive but require significant amounts of labor to realize their potential (e.g., seeds). The high levels of labor can be invested in harvesting and/or in processing. Within the subsistence economy, there may be a few "keystone" resources which are fundamental to long-term economic success. Thus, while a group may harvest a wide diversity of plants, over the long run, they are most heavily dependent on just one or two species. Complex hunter-gatherer economies tend to rely most heavily on aquatic resources (marine, lacustrine, riverine) and/or plants.

Social Organization and Economy

Complex hunter-gatherers are generally characterized by formal, permanent social inequality in the form of ranking or stratification. The systems of inequality are supported and reinforced by political economies which manage the creation and movement of material wealth through the society.

Some definitions of complex hunter-gatherers focus primarily on population size (e.g., Koyama and Thomas 1981). Another label for complex hunter-gatherers, "affluent foragers" as originally defined, emphasized their larger populations. Yet other definitions exclude all characteristics except permanent inequality (Arnold 1996), restricting the term "complex hunter-gatherers" to only those hunter-gatherer societies with permanent inequality and elite control over non-kin labor (i.e., the political economy extends beyond the corporate or kin group). Arnold (2001) proposes applying "affluent forager" to those groups displaying many of these traits, but lacking permanent inequality. Whichever definition or set of traits individual scholars prefer, most research focuses on the development and maintenance of permanent inequality.

As an alternative to trait-based definitions, some researchers (e.g., Price 1981; Binford 2001) define hunter-gatherer complexity in terms of systems' complexity, that is, as cultural systems with many subsystems and many links among subsystems. This carries the implication that the subsystems are heterogeneous, that is, different from each other. The nature of this heterogeneity is often unspecified. Implicit to this definition is the notion that generalized hunter-gatherer

cultural systems lack internal differentiation (subsystems) and are consequently homogeneous.

Historical Background

Lee and DeVore's description of hunter-gatherers essentially crystallized a view of hunter-gatherers that was several centuries old of small, simple, and egalitarian societies. Anthropologists, historians, and others took for granted that these societies represented the pristine human condition and that the appearance and subsequent development of complex societies required agriculture. A few ethnographically documented hunter-gatherer societies displayed traits thought to require agriculture. The classic example was the hunter-gatherer-fisher peoples of the Northwest Coast of North America (coastal northern California, Oregon, Washington, British Columbia, and southeast Alaska). They had dense populations, large communities, and an incipient class system among other things. They were explained away as the consequence of an unusually rich environment: the abundance of the natural environment substituted for the abundance produced by farming. Other exceptions were explained away as a consequence of contact with Europeans or other complexly organized peoples. Hunting and gathering was viewed as a very ancient lifeway that had persisted unchanged for millennia, at least since the appearance of the first modern humans if not their ancestors. The *Man the Hunter Conference*, in fact, grew out of a famous Harvard University project that conducted research among hunter-gatherers in South Africa's Kalahari Desert that was based on the assumption that these people were behaviorally the closest modern analogues to that ancestral state.

The *Man the Hunter* conference was held at the University of Chicago in 1966. By the late 1970s–early 1980s, the picture of hunter-gatherers presented at the conference had become obsolete. As a consequence of a global expansion of archaeological research and knowledge, it was clear that many ancient hunter-gatherer societies were far more diverse and complex than anticipated in 1966. The concepts of "affluent foragers" and "complex hunter-gatherers" were developed in part to encompass and describe this newly discovered diversity. Three international conferences were crucial. The first of these was held in 1979 in Osaka, Japan, with the original purpose of comparing the ancient foraging economies of Japan and California (Koyama and Thomas 1981). It was at this conference that the notion of "affluent foragers" was formalized. As noted above, central to that idea was high population densities supported by rich environments, which required subsistence economies capable of supporting those densities. The second conference was held in Amsterdam in 1980, and its topic was Archaeological Approaches to Complexity (van der Leeuw 1981). Price (1981) presented a paper in which he coined the term "complex hunter-gatherers" and developed the first set of characteristics distinguishing them from generalized hunter-gatherers. His list was based upon comparisons among Japanese, California, and Mesolithic European hunter-gatherers. Thus, two of his three examples were archaeological. He also presented the systems theory definition of complexity. The third conference again was a major international conference held in Vancouver, British Columbia, in 1983 (Price and Brown 1985). It established the concept of complex hunter-gatherers and laid out the agenda for much of the research on hunter-gatherer complexity over the next two decades. This agenda focused on the causal relationships among population growth, subsistence and economic intensification (including storage), mobility patterns, and permanent inequality. At the same time, the importance of corporate groups (Hayden and Cannon 1982) and the domestic mode of production (Ames 1985) to the development of hunter-gatherer complexity was recognized. This was both a crucial theoretical and methodological step, since much subsequent research on hunter-gatherer complexity was framed within household archaeology (e.g., Coupland 1985).

The initial interest in complex hunter-gatherers stemmed from three sources: first, they were a range of societies poorly represented in the modern ethnographic sample, and neither how common they were in the past nor their time depth was

known. Research on complex hunter-gatherers was also research on the diversity of human cultures. Secondly, they represented routes to complexity, particularly to permanent inequality, not dependent on agriculture; they were in a sense an independent set of cultural evolutionary experiments in the evolution of complexity. Investigating them might clarify how and why permanent inequality and other aspects of complexity arose from small, egalitarian societies. Thirdly, they were implicated in the domestication of plants and animals. Research in the 1960s and 1970s suggested that the preliminary steps toward domestication were taken by what became known as complex hunter-gatherers. The origins of civilization – complex societies – and of agriculture were major disciplinary issues globally beginning in the 1950s and were the subjects of intensive research. Research on complex hunter-gatherers could provide insights into both issues. Their presumed role in domestication is now far less clear. They still represent a diverse set of experiments in cultural evolution, and research has tended to focus on the hows and whys of the development of permanent inequality.

This research has investigated key case studies. In North America, these include the Northwest Coast, the Fraser-Thompson Plateau of interior British Columbia, the Santa Barbara Bight of southern California, and western Florida. In these instances, complex societies developed within the last 2000 years or so, although on the Northwest Coast they may have evolved as much as a millennium or two earlier. In these cases, archaeologists have access to both the archaeological record and to ethnographic and ethnohistoric records which can be used as parallel lines of evidence in investigating complexity. Thus, we know, for example, that permanent inequality existed in southern California and on the Northwest Coast based on the ethnographies. Recently, archaeologists in the southeastern United States have explored a record of fluctuating levels of hunter-gatherer complexity between about 5500 and 3000 years ago. Here, complexity is marked by extensive systems of earthen mounds, plazas, and in some places large rings constructed of marine and freshwater mollusk shells – for example, monumental architecture. There is no ethnographic record for these hunter-gatherers.

Globally, among the key case studies are the Jomon hunter-gatherers of Japan, the Natufian peoples of the Levant, and the Upper Paleolithic and Mesolithic peoples of western Europe. These ancient societies illustrate the difficulties and ambiguities of investigating complex hunter-gatherers known only from the archaeological record. It has proven very difficult, for example, to demonstrate the presence of permanent inequality in any of these cases. In fact, Price, who used the Mesolithic in his original formulation of the complex hunter-gatherer concept, has subsequently decided Mesolithic societies were not complex given the ambiguity of the available evidence (Price 1995).

Key Issues/Current Debates

Current debates revolve around the causes of permanent inequality in these small societies (as opposed to the causes of permanent inequality in large societies, such as the Aztec or Incan Empires), although there are other "key" unresolved issues, including the subject matter itself. "Hunter-gatherer" as a category of human society and subsistence has proven difficult to define or at least to draw boundaries around. There are some scholars who argue that the entire concept of hunter-gatherers needs to be abandoned. Similar suggestions have been made for the notion of complex hunter-gatherer, perhaps substituting less economically specific phrases like "middle range society" or "transegalitarian" society. Part of the difficulty arises from preconceptions about hunter-gatherers. A particularly powerful preconception is that they have no significant environmental impact. They harvest wild foods but do not "produce" foods or create "anthropogenic" environments (anthropos – human; genic, genesis as in created, human created or modified environments). It is now clear that all environments in which humans live are anthropogenic to one degree or another, even those occupied by the most "pristine" generalized hunter-gatherers. However, most complex hunter-

gatherers actively modify their environments, acting to increase productivity and predictability through practices such as regular burning or firing the environment, selective harvesting, tilling, pruning, transplanting, and landscape engineering. Such practices are difficult to reconcile with the notion of hunter-gatherers as environmentally passive. Should people who do these things even be considered hunter-gatherers?

Setting that issue aside, a second is whether hunter-gather complexity can be sustained for long periods of time. T. Douglas Price (1995) has suggested that most instances of hunter-gatherer complexity are actually the result of contact with farmers and that hunter-gatherer complexity in any case is relatively ephemeral – that is, it does not last long because hunter-gatherer economies are not capable of the sustained economic production complexity requires. Price may be correct, in long archaeological sequences; complexity among hunter-gatherers does seem to come, go, and sometimes come again in a different form, or not at all. Once complexity develops, it is not necessarily permanent, in some cases disappearing after a few centuries and in other cases persisting for millennia.

A third issue is the notion of egalitarianism. One definition of egalitarianism is that egalitarian societies are those with as many positions of high prestige as their people to fill them and that there is equal access to resources (of all sorts) necessary for life in the particular culture. Many small-scale societies practice what might be termed "formal egalitarianism" in which egalitarianism is highly valued and morally reinforced and anti-egalitarian behavior repressed. It is thought that egalitarianism was essential for small group survival during the Pleistocene with its extreme and rapid environmental shifts. The balanced or reciprocal social ties that formal egalitarianism reinforces provided a crucial safety net when local resources failed. Recently, the whole notion of egalitarianism has been critiqued by anthropologists and others, and this "formal egalitarianism" rethought as a form of reverse dominance hierarchy in which alliances among subdominants restrain and repress dominance. The issue then is whether egalitarian societies as once conceived ever existed. If not, it would suggest that permanent inequality is not, in itself, an attribute of social complexity but rather an attribute of the human condition (Ames 2010).

A fourth issue is the trait-based definitions of complex hunter-gatherers and affluent foragers. It is argued, correctly, that the lists bundle together attributes of complexity, causes of complexity, and the consequences of complexity (Arnold 1996). For example, looking at Table 1, high populations, food storage, and logistical mobility are all attributes of complexity, but perhaps, as Binford (2001) argues, logistical mobility is a consequence of increased population density. If that is so, is population density a trait of complexity or a cause (or perhaps both)? Distinguishing causes and consequences and teasing out their relationships are in part epistemological questions, but they are also methodological. In many instances, our chronological controls are simply not refined enough to know what comes first.

However, current debates focus primarily on the origins and causes of permanent inequality among egalitarian peoples. Prior to about 1990, most explanations invoked general demographic, social, or economic causal processes or circumstances. These included population growth, sedentism, storage, property, and economic intensification (increased production per capita, per unit time, or per unit land). Theoretical work in the 1990s recognized these processes not as causes but either as consequences or catalysts of the development of complexity. The search for causation shifted to human agency, seeing permanent inequality as emerging from the actions of individuals in particular historical circumstances. Some theories (e.g., Hayden 2001) invoke the existence of prestige-seeking individuals or aggrandizers (AAA personalities). Aggrandizers forcefully act or compete to advance their own interests and those of their near kin at the expense of others. Formal egalitarian societies actively repress the actions of aggrandizers since they would disrupt the reciprocal social ties necessary for group survival. The emergence of inequality requires that repression to end, allowing aggrandizers to pursue their own ends. Why does the repression of aggrandizers end?

Answers differ and engender considerable debate. Maschner (1991) argues that aggrandizers will act whenever the opportunity presents itself. In contrast, Brian Hayden posits that repressing aggrandizers is costly in time and energy and therefore erodes or ends when the local environment becomes productive and stable enough to meet everyone's basic needs. This can be the result of environmental or technological changes. When people's needs are met and when reciprocal ties are no longer central to survival, people stop enforcing the rules against aggrandizer behavior, and aggrandizers are free to manipulate their way to social prestige and power. Other scholars (e.g., Fitzhugh 2003) think that inequality develops during times of stress, which provide aggrandizers opportunities for self-advancement. Others do not invoke human personality types, suggesting instead that times of stress facilitate the development of inequality from the normal jostling and friction of human social relationships. Yet other explanations look not to human personalities or material conditions but to changing ideologies and control of symbolic resources (e.g., Sassaman 2004).

Research on the evolution of inequality among hunter-gatherers is part of a broader inquiry into why permanent social inequality is a common feature of most human societies, regardless of subsistence economy or size. Recent work suggests that a common thread among all societies with permanent inequality is the intergenerational transfer (inheritance) of wealth from one generation to the next (Smith et al. 2010). Importantly, this work reconceives wealth to include three forms: material wealth (what we normally think of when we think of wealth, i.e., property, control of material resources, structures), embodied wealth (physical health, skills, knowledge), and relational wealth (exchange partners, social networks, etc.). It appears that inherited differences in embodied and relational wealth occur among modern egalitarian hunter-gatherers. However, such differences may be very difficult to observe and measure among living peoples and even more elusive among ancient ones known only archaeologically. It also appears to be the case that strong systems of inequality are based on material wealth. Archaeologists usually assume that a lack of evidence for material differences in wealth or prestige indicates an ancient society is egalitarian. That assumption can no longer be made. However, more to the point here, this research suggests a rethinking of the general approach to the origins and evolution of social inequality is in order – the key question becomes "under what circumstances does material wealth develop so that inequality becomes both archaeologically visible and stronger?"

Complex hunter-gatherer archaeology has been strongly materialist since its beginnings in the 1970s. Research has emphasized either material causes (e.g., demography, subsistence, economy, ecology, environmental change) or those with relatively clear material consequences (e.g., corporate groups). This research was also comparative (searching for cross-cultural regularities). However, for most of that time, there has been a strong minority among archaeologists taking an idealist stance, arguing for the primacy of ideological systems (e.g., spirituality, belief systems, ethical systems) in shaping hunter-gatherer (and all human) behavior. This scholarship has also tended to focus on the importance of local, contingent (non-repeating, unique) events in shaping cultural history (e.g., Cannon 2011). This division is not restricted of course to complex hunter-gatherer studies. The tension between these approaches raises persistent issues.

International Perspectives

Although the literature may seem dominated by a few case studies (e.g., southern California, Northwest Coast, Plateau, Japan) and a few theorists (e.g., Hayden, Arnold), research on complex hunter-gatherers has been strongly international and intellectually diverse since its inception. Thus, while the Koyama and Thomas' (1981) volume emphasized the North Pacific Rim, the Price and Brown volume drew its examples broadly from North America, Eurasia, the Levant, and Australia and temporarily from the late Pleistocene through the Holocene. A recent volume (Grier et al. 2006) includes papers from East

Africa, Australia, Central and South America, and Korea as well as Jomon Japan and the Northwest Coast. What is new is that while the original literature was written almost exclusively by Anglophone (American and British Commonwealth) scholars, that is no longer the case. The papers are now still primarily in English, but the authorship is much more truly international.

This is a reflection of the expansion of both archaeology as a profession and of the known archaeological record of the past two or three decades. It is obvious that ancient societies were far too diverse to be easily accommodated either by the old stereotypes that all hunter-gatherers were similar to modern generalized hunter-gatherers, and all more or less complex societies were agricultural. The difficulties increase as the variability among human subsistence economies and the degree to which people have modified the environment in the past are more evident. The concepts of "complex hunter-gatherers" or "affluent foragers" provide intellectual and methodological frameworks with which to approach that diversity. While the trait lists (e.g., Table 1) may be problematic in terms of mixing causes and consequences, they provide useful comparative frameworks for conceiving research and dimensions of variability along which that research can be conducted (e.g., Grier et al. 2006). There are three significant elements of this research: it is being conducted within the frameworks of local research traditions but to address questions of global interest, it is interested in testing the basic assumptions and hypotheses of the Anglophone literature, and it is strongly comparative, conducting its tests using multiple case studies.

Future Directions

Several trends seem likely. At a very general level, debate will continue over the ontological status of hunter-gatherers and complex hunter-gatherers: are they real or figments of the anthropological/archaeological imagination. To that extent, this debate is useful; it will either sharpen our understanding of these concepts or help our understanding of the limits of their usefulness. For example, it may be that Arnold is right and that "complexity" is best restricted to hereditary inequality coupled with control of non-kin labor or that Price is correct and complexity is most usefully conceived as a description of a heterogeneous system. Debate will also continue over whether the past is best investigated from a materialist or an idealist epistemology. At some level, these are mutually exclusive, but at less exalted levels, they can be seen as complimentary, and archaeologists will work to build bridges between. Thus, for example, while the sudden appearance of earthen mounds in the southeastern USA may indeed reflect an equally sudden ideological shift, their construction had material consequences in how labor was organized, fed, etc. that also needs to be understood.

The construction of case studies will continue. To my mind, the most useful will be those that endeavor to cover very long periods of time, such as the entire Holocene. Most research tends to focus on particular examples within relatively limited time frames. Thus, in coastal southern California, strong social inequality developed after 1200 cal BP. Consequently, research on the evolution of complexity has tended to focus most heavily only on the last 2000 years. However, an examination of the entire 12,000 year sequence for this region from the perspective of social complexity would be useful. It would facilitate comparisons with other regions and times, and it would help to elucidate the dynamics at work. It is possible, for example, that some aspects of "complexity" came and went over the last several thousand years there. Taking a different example, logistical mobility is widely seen as a crucial causal element in hunter-gather complexity. In south central British Columbia, it appears or develops sometime just after 4000 cal BP, but permanent inequality does not develop until 1200 cal BP. There is a similar temporal lag between the development of logistical mobility and inequality in southern California. Thus, while logistical mobility may be necessary for the development of other aspects of hunter-gatherer complexity, its presence does not seem to trigger rapid social change. Long sequences will also answer questions such as whether hunter-gatherer complexity is inevitably of short

duration, always comes and goes, or if in some cases it is quite durable, and if so, why? At present, almost all well-documented examples of complex hunter-gatherers are Holocene in age. An important question is whether such societies existed earlier. A related question is how, given the difficulties of the Pleistocene archaeological record, we can find them. As part of developing lengthy sequences, archaeologists need improved, finer-grained chronological controls which can only come from improved, finer-grained excavations, use of new field techniques, larger samples of radiocarbon dates (e.g., Prentiss et al. 2007), and alternative methods of independent dating not subject to the problems of radiocarbon dating.

The purpose of long sequences and their comparison, the purpose of any empirical work, is not only establishing patterns in the past but the testing of explanatory hypothesis and the building of theories. Research on complex hunter-gatherers has been one the most significant areas of research into the origins of inequality in human societies since World War II, and most of the theories and hypotheses have been proposed and tested by archaeologists. This will continue.

Conferences on Hunting and Gathering Societies (CHAGS)

Richard Borshay Lee
Department of Anthropology, University of Toronto, Toronto, ON, Canada

Over five decades, a series of spontaneously organized conferences brought together a global array of specialists on hunting and gathering societies and became known as CHAGS. The series has brought together in roughly equal measure, archaeologists, social anthropologists, human evolutionists, and activists concerned about the fate and future of foraging peoples.

The ultimate origin of the CHAGS series of conferences dates to the mid-1960s when Irven DeVore and Richard Lee organized the 1966 "Man the Hunter" Conference at the University of Chicago, resulting in the 1968 book of the same name (Lee and DeVore 1968). The book was successful in launching an era of renewed interest in the anthropology of hunters and gatherers. Despite the title, a major thesis of the book was to emphasize the vital and hitherto underestimated importance of women's work in hunter-gatherer societies and in human evolution overall, the ethnographic evidence for which amplifies and augments the archaeological record.

Man the Hunter had been intended as a one-off event, but a decade later in 1978, Maurice Godelier convened a follow-up meeting on hunters and gatherers in Paris at the Maison des Sciences de l'Homme (Leacock and Lee 1982). The gathering which brought together scholars from six continents and both sides of the Cold War was highlighted by an address by the Dean of the University of Yakutia, himself a member of the Yakut ethnic group. The Paris conference's success indicated that there was a serious demand for conclaves about hunting and gathering peoples, heightened no doubt by the speed with which the remaining viable foragers were being absorbed into regional and global markets and nation-states.

Laval University hosted the next conference, convened in historic Quebec City, Canada, in 1980 chaired by Bernard Saladin d'Anglure and the late Bernard Arcand. It was at Laval that the term CHAGS was coined to provide a shorthand for what was becoming an ongoing enterprise.

CHAGS III, unlike the two previous, was a by-invitation affair, convened in 1983 at Bad-Homburg, Germany, under the auspices of Prof. I. Eibl-Eibesfeldt. Participants were drawn largely from supporters of the "revisionist" side of the emerging debate on the historical status of hunter-gatherers, particularly the Kalahari San (Schrire 1984).

There was a general consensus that if CHAGS was to have long-term viability, it was important for there to be an open invitation, extended to all who demonstrated an interest in the subject, who had research to report, and who were self-financed. This open-door policy was to set the tone for the next three decades of CHAGS gatherings.

CHAGS IV was held in 1986 at the London School of Economics and was convened by a UK-based committee that included Alan Barnard, Barbara Bender, Tim Ingold, Brian Morris, David Riches, and James Woodburn and resulted in two excellent publications (Ingold et al. 1988a, b).

The pace of convening CHAGS accelerated. After a 2-year interval, CHAGS V convened in Darwin, northern Australia, in 1988, organized by the late Les Hiatt and an active cohort of Australian-based anthropologists.

Only 2 years after Darwin, CHAGS VI was convened in Fairbanks, Alaska, in June 1990. Organized by the late Linda Ellanna, the Fairbanks meetings, like those in Darwin, attracted a wide range of spokespersons from aboriginal communities and attracted a large contingent of Soviet anthropologists and archaeologists, who made the short flight from Provideniya in the

Russian Far East to Nome, Alaska (Burch and Ellanna 1994).

Given the enthusiasm of the Russian delegation, there was a consensus that CHAGS VII would convene in Russia. Under the leadership of Valery Tishkov and Victor Shnirelman, one of the largest CHAGS ever opened in Moscow in August 1993. Delegates from 15 countries experienced the excitement of Perestroika, as Russians experimented with new political formations (Biesele et al. 1999).

CHAGS VIII was convened at the famous Japanese National Museum of Ethnology ("Minpaku") in Osaka in October 1998. Chaired by Drs. Shuzo Koyama and Jiro Tanaka, it brought together over 200 scholars from many countries and resulted in publication of an important series of five volumes (see entries for Senri Ethnological Studies, below).

CHAGS IX returned to the United Kingdom and was held in Edinburgh, Scotland, in 2003, chaired by Prof. Alan Barnard (Barnard 2004). A full decade passed before the next CHAGS was convened. Then in June of 2013, CHAGS X was held at the University of Liverpool under the chairmanship of Prof. Larry Barham (chags@liv.ac.uk). Among the publications generated by CHAGS X is a special issue on hunter-gatherer violence and war, edited by Kirk Endicott for the Journal of Aggression, Conflict, and Peace Research (2014).

Until 2013, the global community of hunter-gatherer researchers had (not unlike hunter-gatherers themselves) convened on irregular intervals without a central organizing authority. This global research and activist communities concerned with foraging peoples, their history, present conditions, and future prospects decided to change their format and formed the International Society for Hunter-Gatherer Research (ISHGR). The society's journal – formerly titled "Before Farming" – is now titled "Hunter-Gatherer Research."

These new arrangements were formalized at CHAGS XI which convened in Vienna, Austria, in September 2015 under the auspices of the Department of Anthropology of the University of Vienna and the Austrian National Museum of Ethnology. Key organizers were Khaled Hakami, Peter Schweitzer, and Helmut Lukas. Edited volumes of papers from CHAGS XI are in preparation.

CHAGS XII (chags.usm.my) will convene at the Universiti Sains Malaysia, in Penang, Malaysia, July 23–27, 2018, under the convenorship of Dr. Lye Tuck-Poe (chags2018@gmail.com).

Looking back on a remarkable series of CHAGS conferences spanning a half century, one is struck by the remarkable diversity of venues, with settings as varied as Fairbanks, Darwin, Quebec, and Penang, as well as London, Paris, and Vienna. A wide range of themes have characterized the papers presented at CHAGS, with Archaeology and Evolutionary Theory sharing time with papers on Social Anthropology and, increasingly, papers on indigenous rights and political struggles. CHAGS I through X have left a permanent legacy in the form of substantial volumes of collected papers listed below.

Confinement and Detention in Political and Social Archaeology

Adrian Myers[1] and Gabriel Moshenska[2]
[1]Stanford University, Stanford, CA, USA
[2]Institute of Archaeology, University College London, London, UK

Introduction

Confinement and detention played a central role in many of the most infamous episodes in modern history, including the use of civilian concentration camps in the Boer War, the internment of Japanese-Americans in the Second World War, the Soviet Gulags, and the secret prisons of the Argentinian Junta. The Holocaust of European Jews largely took place within a vast infrastructure of slave labor camps, transit camps, concentration camps, and extermination camps. The material traces of this event at Auschwitz-Birkenau and elsewhere remain among the most iconic modern heritage sites. Penitentiaries and jails – holding people accused or convicted of behavior deviant of social norms – though usually out of everyday view, are of course quotidian features of almost any every society.

The archaeology of confinement and detention is part of a growing field studying the material remains of modern power and structural violence on a global scale. Studies of sites, artifacts, and other traces of confinement reflect many archaeologists' desire to engage with processes of commemoration, truth and reconciliation, education, and heritage management in societies often coming to terms with historical narratives of oppression and social control. Recent work in the archaeology of confinement demonstrates the extent to which it is living up to the heavy responsibility imposed by this historical background. Worldwide, archaeologists are intervening on sites of internment to create and recreate historical narratives. In Argentina and Poland excavators are unearthing sites that the perpetrators of violence had tried to erase (Fig. 1). In the United States and South Africa, former prisoners have participated in the transformation of detention sites into heritage sites, adding their memories to the historical record. These types of projects work to provide a foundation and a platform for the voices of the imprisoned.

Definition

The archaeology of confinement and detention has emerged as an interdisciplinary initiative within the larger and more established fields of historical archaeology, conflict archaeology, and the archaeology of the modern world. The question of scope is often raised, as terms such as confinement, detention, internment, imprisonment, incarceration, and captivity are problematic to define. Broad definitions encourage boundary-pushing work and lively intellectual discourse, and the authors have previously stated:

> Incarceration or internment might be described as the practice of organizing material culture and space to control and restrict the movement of a person or a group of people. Sites of internment can range in scale from a single room or building to entire landmasses (Myers and Moshenska 2011: 2).

Confinement and Detention in Political and Social Archaeology, Fig. 1 A sweater with bullet holes, excavated evidence of the murderous regime of the Argentinian dictatorship (1976–1983). (Courtesy of Melisa Salerno)

Thus, a common sense definition of the archaeology of confinement and detention might be *any study where archaeological approaches are used to interpret the material remains of confinement*.

Historical Background

An early example of the archaeology of confinement took place in Berlin in 1985, when prison cells beneath the ruins of the former Gestapo headquarters were subjected to an unofficial "guerrilla excavation" by a community history group, the *Active Museum against Fascism and for Resistance in Berlin* (Baker 1990). The excavation was largely symbolic, aimed at drawing attention to the official neglect of the site and the perceived failure to adequately memorialize the victims of the Gestapo. The excavators included former prisoners held in the cells on the site, as well as relatives of those who did not make it out alive. The dig was a vivid reminder of the power of archaeology to literally and figuratively uncover hidden histories of oppression and control.

The Berlin Gestapo site has since been more fully excavated and is now open to the public as a striking and unique archaeological museum: the *Topography of Terror* (Hesse et al. 1989). Through their action the diggers sent a message that archaeology can and should be used to study recent violent pasts. Twenty-five years on this maxim has been embraced by archaeologists studying incarceration and internment, and the expansion of this field of study is due in part to the energy and enthusiasm of grassroots community and human rights groups seeking information about people and events, exposure of injustices, healing of wounds, and reconciliation between erstwhile adversaries.

Key Issues

Control and Surveillance

Spaces of confinement and detention are chosen or constructed primarily to control their inmates; among the most distinctive material manifestations are boundaries and other material restrictions on movement. Some of these boundaries are constructed: the concrete walls of a prison, the barbed wire fence of a prison camp. Other, apparently ephemeral boundaries rely on a known threat: step across the line and you will be shot. Another common mechanism of control is the natural boundary: many sites of detention are islands or parts of islands such as Robben Island in South Africa, Ai Stratis in Greece, and Alcatraz

in the United States. Other geographical boundaries include deserts and wildernesses – where survival in the landscape is impossible and physical boundaries are unnecessary. For these reasons Second World War Prisoner of War (PoW) camps were often located in remote areas such as Finnish Lapland, the Australian outback, central Canada, and the mountains of southern Arizona. The remote locations of these sites are an advantage to the archaeologist, as they are considerably less likely than other sites to have been destroyed or damaged by development or other human activities.

Alongside physical control, surveillance is an important element of confinement and detention, the most noted example of which is Bentham's Panopticon, in which large numbers of prisoners could be observed from a central location (Bentham 1791). Surveillance appears in the archaeological record in the watchtowers of prison camps, in the spy holes in prison doors, and in the CCTV and other electronic monitoring systems employed in more recent periods. Traces of these and other elements of surveillance have been studied and recorded in abandoned prisons and prison camps such as Long Kesh/Maze in Northern Ireland. González-Ruibal (2011) has shown how, during and after the Spanish Civil War, certain sites were used for internment due to their symbolism: schools and monasteries represented the authority and order to be imposed on the prisoners. Control takes many forms, many but by no means all of which can be traced in the material remains.

A key component of control and surveillance in institutions – and one that is often exposed through the material remains of sites of internment – is repetition in materials and structures. This trend is patent both in portable material culture (e.g., identical ceramic dishes for all prisoners) and in architecture (e.g., row upon row of matching barracks). The repetition of small materials, and their close regulation, contributes to the institutional goals of social conformity and the elimination individuality and of more easily identifying prohibited items (Fig. 2). Repetition in architecture and the broader penal landscape facilitates surveillance by maintaining long and linear lines of sight, and by eliminating interior variability which could be used to deceive the captors (Fig. 3). The cult of repetition, of course, is not limited to material culture. In reforming institutions at least, repetition encompasses the human body through physical and moral training and adherence to time discipline regimes.

Domination, Resistance, and Cooperation

The experience of internment is one of coercion, oppression, domination, and surveillance. From the perspective of the jailer internment serves numerous purposes but is most commonly used to remove a perceived threat, whether by containment, reform, or annihilation. Almost by necessity, confinement will include domination by the captor and resistance by the captive. Resistance to captivity can take a number of forms, many of them visible in the archaeological record of the internment site. Internment sites are often governed by sets of rules to control the behavior of internees: these include curfews, uniform codes, restrictions on association and communication between prisoners, and the prohibition of trading with guards and outsiders.

The violations of some of these rules can be regarded as acts of resistance to internment, albeit frequently petty and self-defeating ones if they lead to repercussions on the rule breaker or other prisoners. Steve McQueen's character in the film *The Great Escape* is the quintessential internee rebelling petulantly against his captors. The solitary confinement cells at *Stalag Luft III* are testament to the occurrence of this sort of behavior. From an archaeological perspective the most obvious evidences of rule breaking are the remains of contraband goods such as nonuniform clothing (Casella 2000), foodstuffs (Myers 2008), and personal hygiene and grooming products (Pringle et al. 2007).

Perhaps the most direct form of resistance to internment is escape, either by absconding or, where necessary, overcoming the physical barriers. In PoW camps the escape options were summarized as "over the wire" (usually under cover of darkness), "under the wire" (tunneling), or "out the front door" (in disguise). Tunneling is the most archaeologically visible and enduring of

these, and the archaeological investigation of escape tunnels using geophysical and excavation techniques has been successfully conducted at *Stalag Luft III* in Zagan, Poland (Pringle et al. 2007).

Attempting to damage, destroy, or "improve" the prison site is also a form of resistance, often symbolic but in some cases practical. Wall art and graffiti such as that recorded at Long Kesh/Maze served to stamp the internees ideology and identities on an institutional space and may well have served to intimidate outsiders and guards. These artworks were also an act of cultural resistance, a more common theme in internment, often demonstrated in the nostalgic or defiant craftworks and artworks produced by civilian or military detainees and often curated into the present. Such seemingly petty symbols of cultural resistance can maintain the morale of prisoners, and often remained entirely unnoticed by the captors. On a more practical level, many internment sites show traces of the consumption of alcohol and other intoxicants, both as evidence of contraband and a form of temporary escape from the oppression of internment.

González-Ruibal (2011) criticizes overemphasis of resistance in studies of internment, particularly the abstracted formulations of internment that stress the agency of the oppressed and neglect the brutal real-world manifestations of the "discourse" of power. In studying the archaeology of internment there is a risk of becoming too enamored with the glamour of resistance and failing to take into account the constraints, threats of violence and psychological effects of long-term incarceration. To do so would be a betrayal of the victims of the historical crimes we study. In turn, the hierarchical "domination/resistance" paradigm itself, as a whole, has come under increasing scrutiny. Often in cases of internment evidence points to multiple layers and directions of control and surveillance – for example, the notion that prisoners can watch the guards, just as the guards watch the prisoners – which has led some to move

towards analyses of *heterarchy* rather than *hierarchy* (e.g. Casella 2011). Heterarchical approaches leave open the possibility of cooperation between guard and prisoner.

Things in Stories/Stories in Things

The experience of incarceration in all its forms has inspired works of literature, philosophy and scholarship for centuries, from Boethius, Cervantes and de Sade to Hitler, Pound and Gramsci. Diaries, autobiographies and accounts of 'life inside' are also a consistently popular genre, particularly those that describe escape attempts. Accounts of internment are potentially of interest to archaeologists as ethno-historical source materials which can provide valuable information for the archaeologist about the layout of sites, the functions of structures, and the material possessions of prisoners, as well as providing color to reports and publications. The use of such textual sources must, of course, take into consideration the vagaries of memory and artistic license in their creation.

Another use of these accounts focuses on the material culture of internment from a biographical rather than purely descriptive point of view, drawing on theories of the social lives of objects developed in the 1980s. In this model objects are considered in terms of their "life histories" from creation through use, reuse or consumption, disposal, and deposition. The plethora of accounts of internment, particularly for certain periods and events including the Second World War, Apartheid, and the Holocaust, encourages us to consider some of the ways in which we can use these texts to study the material culture of those periods. This is particularly salient in the case of internment sites for which we have multiple accounts by different authors, such as Colditz Castle where the same site, structure and even some objects such as articles of escape equipment are described at different times by different authors.

Throughout history Prisoners of War and internees have passed the time by making craft objects and artworks for use, for sale or as gifts. Dusselier (2008) has shown how Japanese-American internees in the Second World War used handicrafts to domesticate the spaces they found themselves in, to reassert their national and ethnic identities, and to provide themselves and others with emotional support. Studies of British civilian internees in Second World War Germany show a similar phenomenon, including an emphasis on patriotic symbolism. Following the end of periods of detention many of these objects were curated as souvenirs or family heirlooms, often serving as material repositories for stories or memories.

Prison Economies

In every case of confinement, smuggling and trading of both allowable and forbidden goods takes place. This maxim remains true even in situations of extreme material depravity, such as at the death camps of the Holocaust. Secret trading was in fact an integral component even of the mass executions at Birkenau, since the food and valuables found on the bodies of the deceased by the *Sonderkommando* forced laborers were redirected to sustain those not yet sentenced to the gas chamber (Myers 2007). Intriguingly, smuggling often goes "both ways" – goods and services pass from outside the camp or prison to the inside and, in turn, from the inside to the outside. This might happen when, counter intuitively, a prisoner has access to goods not available to neighboring civilian communities, such as the case of Allied PoWs in Europe who received Red Cross care packages filled with items long unavailable under Nazi wartime rationing.

In many cases smuggling and trading are used to supplement grossly inadequate caloric intake, such as at the Nazi death camps in Europe and Japanese camps holding Allied PoWs in Asia during the Second World War. But once basic sustenance is achieved (and sometimes even where it is not), smuggling and trading serve other purposes, such as rediscovering small comforts of home, protecting the body against the natural elements, or preparing for an escape attempt. In some cases, astute black marketing by the confined leads to the accumulation of great wealth and power. Perhaps the most colorful example of this is described by James Clavell (1963), in his historical novel *King Rat*.

Popular culture has often well represented the historical reality that in many situations of confinement the cigarette becomes the base unit of currency. From the PoW camps of the Second World War to present-day penitentiaries in the Unites States, the relative values of all other goods and services are usually measured in cigarettes (Radford 1945; Lankenau 2001; Reed 2007). In some cases, extremely complex prison economies develop which include phenomena such as base currencies (e.g., cigarettes or prisoner-developed paper currencies), offering of services by small business entrepreneurs (such as laundering, cooking, and prostitution), notice boards with classified advertisements, monopolies, price fixing and price gouging, price falls and price rallies, inflation and deflation, and even stock-exchange style traders and speculators working on "futures markets" (Radford 1945).

Trading and smuggling might be seen as a form of resistance, since usually the action is forbidden by institutional regulations. But trading is also often a form of cooperation or even collaboration, since trade networks incorporate guards and other staff. Thus, the prison black market is an example of a social aspect of confinement that challenges the duality of the "domination/resistance" paradigm by showing how guards and prisoners sometime work together for mutual benefit.

Gender

The theme of gender is vital to our understanding of internment from historical, sociological, and archaeological perspectives, as demonstrated by Casella's ground-breaking studies of a nineteenth-century prison in Tasmania (e.g., Casella 2001a, 2007). The practice of internment has often been explicitly gendered in cases where only the military-age males of a population have been interned, or where the families of men involved in insurgencies have been interned to isolate, demoralize and blackmail the combatants – as in South Africa during the Boer War. In most internment sites where both men and women were held there was physical segregation of the sexes, and women were sometimes held in accommodations considered more comfortable, secure or private than that of the men. This separation is a common pattern that might be recoverable in the archaeological analysis of internment camp sites. Most of the cases where male and female internees were treated without differentiation are those where murder or genocide was the ultimate aim of the internment.

There is a need for more studies in the visibility of gender in the archaeology of internment. As Casella has argued, even acknowledging the existence of women in these sites genders the history and archaeology of internment, an important stage in the evolution of the discipline, albeit one we might hope by now to have superseded (Casella 2001b: 68). Future studies in the archaeology of gender in internment might consider the construction and interpretation of gendered material culture assemblages, gendered representations and commemorations of internment, and forge links with studies of sexuality and sexual and reproductive health in internment and incarceration. One of the most important outcomes of a gendered archaeology of internment will be a critique of the widespread view of female internees as vulnerable, helpless victims. The archaeological evidence, as Casella has demonstrated, is likely to tell a very different story.

Sexuality

Though all forms and expressions of sexuality that exist outside of confinement can also plausibly occur within prisons and prison camps, sexual activity, like all other activities, is constrained and changed under conditions of confinement. Institutions usually aim to control sexuality and sexual reproduction, and perhaps the most obvious attempt at this is through the common practice of separating women prisoners from men prisoners, and both of these from non-prisoners of any gender. This obstruction of heterosexual relationships is of course often challenged through prohibited access to buildings or wards (possibly facilitated by bribes), permanent or temporary escapes, assignment to work details or billeting outside of the prison, and in some contexts sanctioned conjugal visits. In addition to separation of the sexes, working against all sexual activity in prisons and prison camps are two further forces of institutional control: the unfailing lack of privacy

and the reduction of caloric intake, which has the side effect of reducing sex drive.

Where prisoners are housed in open areas or have access to each other – which is the case in most situations of confinement – same-sex relationships are maintained with comparative ease. This trend came under the scrutiny of military doctors after the Second World War when anecdotal evidence suggested that some formerly heterosexual Allied PoWs "turned" to homosexuality when faced with many years in camps populated exclusively by men (Cochrane 1946; Jackson 2004).

Both consensual and non-consensual sexual relations take place under conditions of confinement, and sexual abuse, sexual slavery, forced prostitution, and rape and mass rape are consistent aspects of institutional confinements. In some cases in the Nazi concentration camps, female prisoners were selected by the guards for housing in the camp brothels, which both guards and wealthy prisoners could pay to visit.

Stakeholder Communities

There is a recurrent theme in the archaeology of the modern world in general, and of the archaeology of internment in particular, of surviving participants of the events under investigation becoming involved in the research process (Moshenska 2009) (Fig. 4). This trend has theoretical, methodological, and ethical dimensions which future archaeologists studying internment sites will need to take into account. A central aspect of community involvement in archaeologies of internment is the value of individual memories in reconstructing the material and social formations of the site. Many internment sites teeter on the edge of living memory, and oral historical research can reveal an enormous amount of information of use to the archaeologist.

The most important consideration in community archaeologies of internment is the recognition of the multiple, overlapping and often violently antagonistic communities involved. These include victim, perpetrator, and bystander communities; exiled or diaspora communities; and current residents on or near the site who may be associated with some or none of these (Cappelletto 2005). Planning for the engagement or involvement of these multiple communities may make the archaeology of internment a more difficult task, but the ethical and practical implications of ignoring them are far greater.

Future Directions

Today the sites of some of the most infamous prisons and concentration camps of the twentieth century are forest. Within a few decades – the blink of an eye in archaeological terms – vast settlements carved and built from the forests of central Europe, for example, have been reabsorbed by their natural environment. What are the mnemonic and archaeological implications if one can walk for miles across the sites of Treblinka or *Stalag Luft III*, once home to tens of thousands of prisoners, without realizing it? One of the most common and striking characteristics of internment sites, and from an archaeological perspective one of the most troubling, is physical ephemerality (Fig. 5). This is particularly the case with internment camps; indeed, the very term "camp" implies a temporary residence.

This ephemerality has been repeatedly exploited by the perpetrators of internment – from Nazi Germany to Pinochet's Chile – to erase the traces of camps and other internment sites from the earth and thereby from history. Combined with the absence or destruction of documentary evidence and the murder, silencing, or shaming of prisoners and witnesses, it is terrifyingly feasible that a substantial episode of internment can be erased and subsequently denied. Against this backdrop of physical and historical ephemerality, devastating c-transforms and powerful n-transforms, the responsibility of the archaeologist grows: to diligently collect what meager traces remain, and to bear witness legally or historically. The term "forensic archaeology" is usually taken to refer to studies of human remains. Its literal meaning is archaeology carried out as part of the judicial process, and it is in this sense of the term that archaeologists might want to approach sites of internment: as crime scenes where the gathering and interpretation of evidence must be carefully conducted, documented, and maintained for future use. Archaeologists are uniquely skilled to collect and store these fragile forms of data.

This appeal to careful examination is not meant to disparage or belittle the more descriptive or interpretive archaeological work conducted on internment sites, nor to suggest that archiving a site totally fulfills our moral responsibility to the past. Many internment sites are well recorded or well preserved and will survive as heritage sites or sites of memory for the foreseeable future. Yet to these as much as to faint traces of barracks beneath a forest floor archaeologists arguably have a duty of stewardship.

Confinement and Detention in Political and Social Archaeology, Fig. 5 Ruins of Auschwitz-II Birkenau. The site was razed by the fleeing Nazis, and vast fields are all that remain of large sections of the concentration camp. (Courtesy of Adrian Myers)

It is heartening to note, however, that countering this fact of ephemerality and trend towards erasure is the growing interest of archaeologists. With increasing temporal distance from the two World Wars, for example, we are beginning to see increasing archaeological research on internment camps from these most devastating and influential eras. Clearly, however, there are presently major gaps in the archaeological study of prisons and prison camps, and archaeologists need to expand their interest to outside of North America, Europe, and Australia.

Conkey, Margaret Wright

Marcia-Anne Dobres
Department of Anthropology, University of Maine, Orono, ME, USA

Basic Biographical Information

Margaret (Meg) Conkey (Fig. 1) is one of the leaders in archaeological method and theory, gender and feminist archaeology, and Paleolithic art. She received her B.A. in Ancient History and Art from Mount Holyoke College in 1965, and an M.A. (1969) and Ph.D. (1978) in Anthropology from the University of Chicago. Conkey taught at San Jose State University (1970–1976), University of California, Santa Cruz (1979–1980), and SUNY Binghamton (1982–1986), where she also served as codirector of Women's Studies. She joined the faculty of the University of California at Berkeley as an Associate Professor in 1987, received the Class of 1960 endowed chair in 1997, and became an Emerita Professor in 2011. Conkey also served as Director of the Archaeological Research Facility (1994–2007).

Conkey has held numerous professional administrative positions and been honored by many awards. She was the Chairperson of the Committee on the Status of Women in Archaeology of the American Anthropological Association (1975), and served as President of the Association for Feminist Archaeology of the American Anthropological Association (1997–1999) and President of the Society for American Archaeology (2009–2011). At Berkeley, Conkey received the Distinguished Teaching Award of the Division of Social Sciences in 1996, the Educational Initiatives Award in 2001, and the Chancellor's Award for Advancing Institutional Excellence in 2009.

Conkey, Margaret Wright, Fig. 1 Margaret (Meg) Conkey

She was awarded an honorary degree from her alma mater, Mount Holyoke College, in 1995. Conkey is an elected Fellow of the California Academy of Sciences (1998) and serves on the board of the Center for Advanced Studies in the Behavioral Sciences at Stanford University. *Discover Magazine* named Conkey one of the "Fifty Most Important Women in Science" in 2002.

Major Accomplishments

Conkey's contributions can be divided into three interrelated arenas: (1) Paleolithic, or Ice Age art (though Conkey prefers the term "visual imagery"); (2) the archaeology of gender; (3) a feminist approach to archaeological method and theory.

Conkey's 1978 dissertation was the first structural analysis of portable Paleolithic art pursued at an American university. In the mid-1970s, the University of Chicago was at the forefront of the "New" or Processual Archaeology, which emphasized the relationships between the natural environment and culture. This perspective did not consider Ice Age art a legitimate topic of scientific inquiry because at the time no one could imagine imagery painted on cave walls or carved into bone, antler, and ivory as having any adaptive value.

Conkey was the first to apply a culture-as-adaptation perspective to the question of Ice Age visual imagery. But she merged this "Americanist" focus with the structuralist work of French archaeologist André Leroi-Gourhan. Conkey

demonstrated that seemingly inconsequential portable artifacts "decorated" with patterned lines, hatch marks, half-circles, and the like had an adaptive function in promoting hunter-gatherer aggregation activities during the Upper Paleolithic (specifically Magdalenian) (Conkey 1980, 1984, 1989). Importantly, Conkey was not trying to decipher what the images meant. Rather, she was analyzing how their patterning would have been adaptive for those making and seeing them. Conkey has long stressed the important distinction between trying to get at the meaning-content of prehistoric visual imagery (an unverifiable orientation open to speculation) and the more anthropological (and also testable) concern with understanding how such imagery was full of meaning for the makers, users, and viewers.

Conkey's research on Paleolithic visual imagery has advanced archaeological method and theory in at least two important ways. First, it demonstrates that Paleolithic art is a valid scientific topic amenable to hypothesis testing. Second, her work has also paved the way for understanding ancient visual imagery from an adaptive perspective. In this, Conkey has shown how ancient visual imagery was as central and necessary to ancient cultural survival as were stone tools or fire.

Conkey's second major contribution to the discipline concerns the archaeology of gender. Prior to her path breaking article with Janet Spector "Archaeology and the Study of Gender" (1984), the activities of ancient women and men were taken for granted. It was assumed, uncritically, that in the past men made and used the hard tools (that conveniently survive in the archaeological record) to hunt, to dominate nature and thus ensure cultural survival, while ancient women were assumed to have pursued the "less important" activities (with perishable tools) such as gathering and childcare. Conkey was among the first to call into question such unfounded assumptions. Importantly, she went further by suggesting that ancient gender relations (much like Paleolithic visual imagery) mattered substantially to how cultures functioned in the past (Gero and Conkey 1991; Conkey 2008). In this regard, Conkey helped make gender both a necessary and legitimate topic of archaeological inquiry.

Conkey's third major contribution is also her most ambitious: developing a feminist-inspired alternative to mainstream archaeological research. Her focus on "doing archaeology as a feminist" is an extension of her work uncovering gender bias in the everyday practice of archaeology (Conkey and Tringham 1995; Conkey and Gero 1997; Conkey 2003). Among other revelations, Conkey has demonstrated the extent to which New Archaeology's systems-theory definition of ancient culture was shaped by insidious gender biases producing sterile understandings of the past. As a result, Conkey's feminist insights have stimulated archaeologists around the world to rethink their categories of data, the analytical scales deemed appropriate for particular research questions, and even to reassess which empirical patterns are relevant (e.g., Du Cros and Smith 1993). In feminist theory, this is known as the "receding horizon," whereby an initial challenge to mainstream thought or practice raises additional concerns that, over time, lead to more fundamental epistemological, ontological, and philosophical questions. In archaeology, Conkey's initial concern with how mainstream archaeology undertheorized ancient gender has led to far more substantial concerns with archaeological research and theory building.

Influence on the Discipline

Conkey's perspective on Ice Age visual imagery is important not only for having introduced English readers to the structuralist theories of Leroi-Gourhan. She also vastly improved this perspective by infusing it with an anthropological concern with ecology, function, and adaptation. Conkey is directly responsible for elevating Paleolithic "art" to a legitimate topic of scientific inquiry, exemplified by the widely popular "art-as-information" school of thought. She also radically transformed our understanding of gender in prehistory, arguing through her own research, that gender was a process central to both social reproduction and to culture change. As a result, gender is now a theoretically informed and empirically grounded topic pursued by archaeologists studying practically every time and place in the world's past. Her work has also raised awareness of the

extent to which gender bias shapes every facet of the discipline, in turn leading to a significant amount of retrospection and reformulation (Conkey 2003). Finally, Conkey has been an articulate, tireless, and passionate advocate for a feminist (and more generally, a humanistic) approach to prehistory. In the field and in the classroom, Conkey has substantially reshaped the everyday practice of contemporary archaeology. Through her innovative blending of French and American perspectives, the sciences and the humanities, and feminism, few twentieth-century archaeologists have influenced so many different aspects of the discipline.

Connah, Graham

Wendy Beck
Archaeology and Palaeoanthropology, University of New England, Armidale, NSW, Australia

Basic Biographical Information

Professor Graham Edward Connah is an archaeologist of both Africa and Australia. His particular expertise is archaeological field research, including excavation, in tropical Africa and in Australia. He is a noted author and editor, particularly of archaeological syntheses. He has excavated and conducted archaeological fieldwork in Britain, Nigeria, Egypt, Uganda, and Australia. He was born in 1934 and grew up in Northern England. He received a B.A. in 1959 and an M.A. in 1964 from Cambridge University. He received a Doctor of Letters degree from the University of New England in 1984 on the basis of his two books *The Archaeology of Benin* (Connah 1975) and *Three Thousand Years in Africa* (Connah 1981). He is a member of the Order of Australia, awarded in 2000, "For service to the promotion and enhancement of the profile of Australian historical archaeology through the University of New England, as a researcher and author, and to African archaeological research."

Professor Connah joined the University of New England in NSW, Australia, as a lecturer in 1971 and was appointed Emeritus Professor upon his retirement in 1995. Professor Connah continues to take an active role in both national and international archaeology since his retirement, always ably assisted by his wife Beryl. Professor Connah has been a fellow of the Royal Anthropological Institute of Great Britain and Ireland since 1966 and a fellow of the Society of Antiquaries of London since 1968. He was elected a fellow of the Academy of the Humanities in 1988 and was chairperson of the Academy's Archaeology and Prehistory Electoral Committee in 1993. He was elected president of the Australasian Society for Historical Archaeology (ASHA) in 1992 and has had a long-standing involvement with ASHA as committee member, president, and founding editor of what became *Australasian Historical Archaeology.*

Major Accomplishments

Professor Connah is a respected member of the national and international research communities. He has presented papers at conferences across the world, from Los Angeles, Mombasa, Cambridge, Adelaide, and Harare to Canberra and Minneapolis. Professor Connah is a passionate advocate of the importance of publishing archaeological results, and he has not only provided outlets for others to do so but has published conscientiously himself. His most influential publications are *Of the Hut I Builded: Archaeology of Australia's History* (1988), revised as *Archaeology of Australia's History* (Connah 1993) and *African Civilizations: An Archaeological Perspective* (Connah 1987, second edition 2001, third edition 2015). Some of his other important Africanist books are *The Archaeology of Benin* (Connah 1975), *Three Thousand Years in Africa* (Connah 1981), and *Kibiro* (Connah 1996). In 2004, he published a general book on the archaeology of Africa entitled *Forgotten Africa* (Connah 2004), which has since been translated into German (2006), French (2008), and Italian (2009). His book *The Same Under a Different Sky? A Country Estate in Nineteenth-Century New South Wales* (Connah 2007) is about his work at Lake Innes in northern NSW. He recently completed a book on archaeological writing for Cambridge University Press, *Writing About Archaeology* (Connah 2010). The impact and breadth of Professor Connah's research is shown by three of his volumes becoming standard texts in their subject areas: *Australian Field Archaeology: A Guide to Techniques* (Connah 1983a) in courses on archaeological field methods; *Archaeology of Australia's History* (Connah 1993) in the area of Australian historical archaeology; and *African Civilizations* (Connah 1987) in the study of precolonial cities and states in Africa.

Professor Connah's career has had a profound impact on the discipline of archaeology in three principal ways. In 1971, Professor Connah joined the (then) Department of Classics and Ancient History at the University of New England. He was a founder of historical archaeology as a subdiscipline of Australian archaeology (Connah 1998, 2003); he has been a major player in the

development of archaeological studies of Africa and within African countries; and he established one of the most successful archaeology university departments in Australia. Originally (and still) an Africanist, he turned his focus to historical archaeology when he came to the University of New England and wanted to provide students with more diverse field experiences. So he trained many students over the years at historic Australian sites such as Saumarez Station, Winterbourne, Bagot's Mill, and Regentville (Connah 1976, 2003) as well as carrying out field archaeological investigations of Aboriginal sites (Connah et al. 1977; Horton and Connah 1981; Connah and Jones 1983). He has been instrumental in providing pathways to higher education, for example, in 1993, he helped to organize and teach a series of seminars for postgraduate students at the University of Nairobi, Kenya, which was funded by the Swedish government as part of an overseas aid program.

In 1986, Professor Connah began teaching one of the first historical archaeology courses at an Australian university. This tapped into the heritage interests of the Australian public, which have since burgeoned. Historical archaeology is now taught at many Australian universities, including the Australian National University, Charles Darwin University, Flinders University, James Cook University, La Trobe University, Sydney University, the University of Queensland, University of Tasmania, and the University of Western Australia. He was appointed as head and sole staff member of the newly established Department of Prehistory and Archaeology in 1974. When he retired in 1995, the (renamed) Department of Archaeology and Palaeoanthropology had a staff of 13, including 8 academic appointments, an ARC fellow, a professional officer, and a technical officer. The Archaeology and Palaeoanthropology teaching unit at UNE has not been as large, either before or since 1995. In 1995, it had an undergraduate enrolment of 600, comprising about 50% distance education students, and Professor Connah attracted a contingent of high-quality postgraduate students. The expansion of this Department during this period was largely due to his extended efforts (Connah 1983b, 1997, 1998).

Currently, he is a visiting fellow in the School of Archaeology and Anthropology at the Australian National University, Canberra. His main interest remains the archaeology of tropical Africa, particularly the last 4000 years.

Conservation and Management of Archaeological Sites

Tim Williams
Institute of Archaeology,
University College, London, UK

Brief Definition of the Topic

International peer-reviewed journal. Published four times a year by Taylor and Francis.

Address: 5 Howick Place, London, SW1P 1WG, UK.

Website: http://www.tandfonline.com/loi/ycma20

Past editors: Nicholas Stanley-Price (1995–2006) and Tim Williams (2007–2016).

Current editor: Kimberley Tewinkle (2017 onward).

The peer-reviewed journal *Conservation and Management of Archaeological Sites (CMAS)* is a primary reference in the field of archaeological site management both for active professionals and for the academic community. Launched in 1995, the journal covers both theoretical and practical issues in archaeological site management and conservation. Peer-reviewed papers from around the world report on new thinking and best practice in site management and conservation. CMAS also publishes short comments, conference reports, book and website reviews, and lists forthcoming conferences and meetings.

Topics covered have included cultural, social, ethical, and theoretical issues in archaeological site management and conservation; documentation and condition reporting; site deterioration and environmental monitoring; preventative conservation, including reburial and protective sheltering of sites; perseveration in situ; building materials analysis and treatment; restoration and reconstruction of buildings; visitor management; sustainable tourism; site interpretation and education; and national and international legislation and charters.

Special issues have included the following: 2002 Shelters on Archaeological Sites, 5(1–2); 2004 Reburial of Archaeological Sites, 6(3–4); 2008 Archaeological Sites and Education, 10(1); 2009 Conserving Marine Cultural Heritage, 11(1); 2009 Archaeology and Conflict, 11(3–4); 2011 Managing Archaeological Sites in Sub-Saharan Africa, 13(2–3); 2012 The 4th International Conference on Preserving Archaeological Remains In Situ (PARIS4), 14(1–4); 2013 Managing Archaeological Sites in Greece 15(1); 2014 Perspectives from the Arabian Peninsula 16(2); 2014 Coudenberg, Brussels, 16(1); 2015 Living with Our Dark Heritage, 17(1); and 2016 The 5th International Conference on Preserving Archaeological Remains In Situ (PARIS5), 18(1–3).

Conservation and Preservation in Archaeology in the Twenty-First Century

Douglas C. Comer
ICOMOS International Scientific Committee on Archaeological Heritage Management (ICAHM), Cultural Site Research and Management, Inc. (CSRM), Baltimore, MD, USA

Introduction

For the past half century, the focus of conservation and preservation in archaeology has been moving away from an overriding concern with developing and applying treatments (the chemical and physical means by which arrest deterioration or prepare an object or structure for display) toward a focus on the holistic management of archaeological sites and landscapes (Getty Conservation Institute 2003). While treatments remain essential, this new approach emphasizes the need to inventory and evaluate archaeological sites systematically, to assess and prioritize conservation and preservation needs with reference to the context provided by evaluation, and to acquire the resources by which to protect sites though careful presentation of them to the public. The ideal is acknowledged to be protection of archaeological materials in situ and to do this by utilizing nonintrusive research methods as much as possible. The challenge now is to balance the ideal of preservation with the need to garner the resources required for preservation through engagement with the public at archaeological sites and through the responsible use of media. This requires constant negotiation with all parties having an interest in archaeological sites. Outcomes have proven to be favorable when archaeologists, material conservationists, and architectural conservationists work together to advocate and plan for the preservation of archaeological material and context.

C

Definition

Conservation Versus Preservation

The terms conservation and preservation have been used in reference to archaeological sites in ways that they are not used in other fields. Environmental management is closely allied to archaeological heritage management, yet environmentalists draw a clear distinction between conservation and preservation: Conservation is seen as the proper use of nature, while preservation is regarded as the protection of from improper use. The primary concern of environmentalists is conservation, not preservation. Populations of plants and animals are renewable, despite the removal of individuals within populations through harvesting or environmental change. Conservation goals allow for change within acceptable limits. Those *limits of acceptable change*, a term that has become central to the practice of natural resource conservation, ensure that new individuals will take the place of those lost. Preservation, from the standpoint of natural resource management, is short sighted. It seeks to protect individuals within the population, the population as a whole, and the environment from change. Given that ecologies are dynamic, the application of preservation principles to environmental management has proven to be ecologically unsound.

In contrast, archaeological materials are finite, nonrenewable, and irreplaceable. To preserve what these might contribute to scientific and historical knowledge requires that we safeguard not only the materials themselves but also the context in which they occur, that is, they must preserved in situ. Therefore, to an archaeologist, preservation must be the ideal. The concept of "limits of acceptable change" does not fit well with this ideal.

Preservation in the field of architectural conservation has a different but not altogether unrelated meaning, which is to stabilize a structure by preventing further deterioration and to leave it in its current form (United States National Park Service 1968: 21). The present form of a structure might contain elements from different time periods. Whatever is present when the structure is found is stabilized.

Nonetheless, as they are commonly used by archaeologists, the terms conservation and preservation are largely interchangeable. The manner in which the term conservation has been historically been used is reflected and has been further propagated by the Venice Charter. Article 5 of that document says, for example, that "The conservation of monuments is always facilitated by making use of them for some socially useful purpose. Such use is therefore desirable but it must not change the lay-out or decoration of the building. It is within these limits only that modifications demanded by a change of function should be envisaged and may be permitted" (ICOMOS 1964). Similarly, conservation treatments of archaeological sites and materials are usually done in an effort to make them available to some social useful purpose, and often this is to present archaeological materials on-site or in museums.

Stabilization

Stabilization has been defined as the effort to minimize the deterioration of a structure, as a means to the end of preservation as defined just above, thereby accomplishing the objective of preservation. It was so defined, for example, in the United States Secretary of the Interior's Standards and Guidelines, but in the revised guidelines issued in 1995, the term itself was removed.

Restoration

According to the Venice Charter (1964: Article 9), restoration "must stop at the point where conjecture begins, and in this case moreover any extra work which is indispensable must be distinct from the architectural composition and must bear a contemporary stamp." The latter part of this statement is widely interpreted to mean that any new materials must be distinguishable from original fabric. The further statement is made that "The restoration in any case must be preceded and followed by an archaeological and historical study of the monument."

Reconstruction

Reconstruction is widely regarded as problematic but is acceptable under certain conditions according to most of the relevant published standards. The document that probably carries the most far-reaching influence in the field of conservation and preservation is *the Convention Concerning the Protection of the World Cultural and Natural Heritage (the World Heritage Convention)* (UNESCO 1972). *The Operational Guidelines for the Implementation of the World Heritage Convention* (UNESCO 2012) have this to say: "In relation to authenticity, the reconstruction of archaeological remains or historic buildings or districts is justifiable only in exceptional circumstances. Reconstruction is acceptable only on the basis of complete and detailed documentation and to no extent on conjecture." As Stanley-Price points out (2009), the World Heritage Convention is the only document that pertains to conservation and preservation issues that have a legal basis. Signatories to the World Heritage Convention become States Parties and are bound in that way. It is especially notable that more countries have signed the World Heritage Convention than any other international treaty.

Among other organizations that have stewardship responsibilities for archaeological sites and a well-developed policy for cultural resource management is the United States National Park Service. The Cultural Resource Management Guidelines for the National Park Service (NPS-28) describe the circumstances under which restoration can be conducted, which include "Archeological, documentary, or physical evidence is available to permit accurate reconstruction with minimal conjecture, and such reconstruction is essential to public understanding of the cultural associations of a park established for that purpose" (United States National Park Service 1998: 128).

Authenticity

The need for authenticity is related to the application of the Venice Charter to instances of restoration and reconstruction. As the Nara Document on Authenticity (1994: Paragraph 10) puts it:

Authenticity, considered in this way and affirmed in the Charter of Venice, appears as the essential qualifying factor concerning values. The understanding of authenticity plays a fundamental role in all scientific studies of the cultural heritage, in conservation and restoration planning, as well as within the inscription procedures used for the World Heritage Convention and other cultural heritage inventories.

This would appear to directly address the reservations about reconstructions and restoration that are evident in the Venice Charter and the World Heritage Convention, as well as many other conservation and preservation guidelines. These include those published by the United States National Park Service (1998: 129–31), which, despite a cautious approach, also allow for restoration given adequate archaeologically derived evidence or documentary evidence.

Heritage Versus History

David Lowenthal (1996: 102) draws a distinction between heritage and history. He sees heritage as a commemoration of people and places that produces a sense of personal and community associations. Heritage is an "exalted legacy," one so seductive that it can threaten the study of "history," which attempts to study the past with as much objectivity as possible. Heritage can be "popularized, commoditized, and politicized" (Lowenthal 1996: 87). It can also become an economic asset. This is perhaps more true than ever before, as transportation networks have greatly expanded and travel has become less expensive.

The economic use of archaeological sites can generate widespread support from business, communities, and governments. It can also provide the funding necessary to safeguard archaeological sites from damage by looting, conflict, or natural forces such as erosion. Because economic values often override all others in practice, the distinction between conservation and preservation becomes more crucial. The latter is essential if archaeology is to serve history while managing the market demands of heritage.

Historical Background

For many years, archaeologists, especially those employed by academic institutions and museums, have been engaged in the conservation and restoration of structures and the acquisition of aesthetically pleasing artifacts for display at museums, in addition to undertaking research. The practice of archaeology, in this role as handmaiden to monument conservation and restoration, was guided by the Athens (Le Corbusier 1933) and Venice Charters (ICOMOS 1964), which promoted the idea of minimum intervention, reversibility, and anastylosis (the recomposition of existing architectural members) as the only acceptable form of reconstruction. It also focused upon material authenticity. Anastylosis was conducted at many sites across the globe, in part as a means through which archaeologists could secure both political and financial support, which enabled countries with an architecturally rich heritage to develop destinations for tourism. These sites also became potent forces for the construction of national identities and as a foundation for the "imagined community" (see Anderson 1983) needed to secure a place in global politics.

The emphasis was on excavation as the means by which to advance such goals, and this was inherently problematic because excavation is an unavoidably destructive process. Conservators were often not on site when vulnerable materials were exposed. As funds and energies became exhausted at the end of field sessions, the stabilization and protection of the exposed site was, in some cases, overlooked. More than 100 years after Schliemann excavated Troy, artifacts from the site were being treated for conservation. Artifacts from sites of lesser renown would never benefit from such sustained attention. Clearly, a more comprehensive and realistic approach to discharging the responsibilities that archaeologist must accept when excavating ancient materials and structures was required.

Today, archaeology is intertwined with archaeological heritage management. A benchmark in this was a session organized by the Getty Conservation Institute at the Fifth World Archaeological Congress (WAC-5) in 2003, held in Washington, DC. The introduction to the resulting publication stated, "Foremost among the directions in which archaeological conservation has moved are methodological that provided the cultural foundation for the constitutional state, which is site management planning and implementation and support for the increasing participation of indigenous peoples and communities and other stakeholders. . ."(Getty Conservation Institute 2003: 2). It is has become generally acknowledged that holistic planning and establishing capacity for comprehensive and effective site management are prerequisites for effective conservation and preservation. Without these, benefit realized from any treatment is temporary, and the site and component materials will continue to deteriorate and ultimately be lost.

Key Issues/Current Debates

It is likely that the most vigorous and important debates regarding the conservation and preservation of archaeological sites revolve around the issue of how to balance preservation in the archaeological sense – preservation of material as discovered in the context in which it was discovered – with the necessity to gather the economic and political support needed to ensure preservation. Tourism, which powerfully attracts political and popular support for preservation of archaeological sites and landscapes, carries with it a cost in terms of loss of material culture unless it is carefully managed, and too often this is not the case (see Comer 2012). Yet without the support that tourism generates, many sites would be damaged or destroyed by natural processes or by looting.

Archaeology must also look to its ethical standards. Frank Matero and others have been critical of archaeologists for not observing what they see as basic conservation principles. Matero (2008: 2) has said that "The practices of archaeology and conservation appear by their very nature to be oppositional". It can also be said that many treatments done in the name of conservation have, ironically, proven to be destructive of the very materials that were to have been conserved. Both archaeological research and the conservation of archaeological sites and materials have and can be conducted in ways that prioritize economic benefit over scientific and historic knowledge. The standing structures fashioned by anastylosis by archaeologists and conservators working together create not only a didactic device but also a tourism asset. Artifacts are prepared for display in museums to attract visitors, sometimes in ways that destroy material that with analysis in the future might be informative.

An approach that minimized the need for both intrusive archaeological excavation and conservation treatments would amount to a preservation approach and one consistent with the objectives of archaeological heritage management. Archaeological heritage management by its nature must take the long-term view to be effective. From that perspective, the first priority is protecting archaeological sites and materials from destruction or damage. Effective archaeological heritage management directs research and controls the marketing of heritage in ways that preserve archaeological materials. Yet the long view also must accommodate economic and political realities until the day when nondestructive technologies and fully developed management capacities become commonplace.

Future Directions

Minimizing and Mitigating Archaeological Intrusion

Archaeologists today utilize many methods, technologies, and approaches that are intended to minimize excavation and maximize information retrieved from archaeological materials. Archaeological guidelines and standards that are now common in most parts of the world stipulate that materials recovered by means of excavation be carefully catalogued and analyzed in ways that become part of the permanent record. Excavation

records are typically subject to examination and review by a variety of administrative authorities at the national, regional, and local levels. Given such capacities and this obligation, it is only practical nowadays to limit excavation and the numbers of artifacts recovered to that which is absolutely necessary to accomplish carefully formulated excavation objectives. Recordation of findings mitigates to some degree the destruction and removal from context of archaeological remains.

Further, the availability and use of remote sensing and the analysis of data collected by digital technologies make it possible to extract information from archaeological sites and landscapes in ways that demand much less excavation. Geophysical technologies, such as ground-penetrating radar, magnetometry, electrical resistivity, and the electrical conductivity can be used to conduct a nondestructive, subsurface inventory. Aerial and satellite remote sensing can provide information about subsurface remains given optimal conditions but, more importantly, can be used to reconstruct environmental context and suggest relationships between archaeological sites and the environment, and among archaeological sites themselves, which enrich interpretation of what is retrieved via archaeological excavation. Such relationships can be further revealed and tested through the use of spatial analyses. Among spatial analyses of particular promise are space syntax analysis, least cost analysis, and others that can highlight relationships among terrain, environmental attributes, and human settlement and regional use patterns (Comer and Harrower 2013).

It might be said, therefore, that the ultimate objective of both archaeological research and heritage management has always been preservation but that the proximate objectives, often driven by institutions that provide finding for archaeological research, have included the necessary use of destructive methods. The destruction that has been necessary is quickly being minimized.

A Unified Approach to Preservation of Nonrenewable Resources: From Treatments to Strategy

Materials taken from the ground are confronted with a very different environment than that from which they were removed, and often deteriorative processes accelerate in this new environment. It is the responsibility of the archaeologist to stabilize these materials in ways that allow and do not impede analysis of them. Conservators also are tasked with preparing materials for display or for long-term storage from which they can be retrieved for future study or display. In addition, conservators address the means employed to stabilize and maintain standing structures. As noted previously, treatments have been the focus of conservators for many years, and many improvements to treatments will be seen in preservation and conservation entries found within this encyclopedia. A unified approach to archaeological site management includes prioritization of conservation and preservation needs; identifying the facilities, human resources, and funding needed to satisfy those needs; and protecting archaeological sites from the degradation that accompanies poorly managed visitor flow and unregulated development on and around archaeological sites. This unified approach can be given forms by means of planning documents that go by a variety of names: Management plans, general management plans, operating planes, and sometimes conservation plans. The plans themselves do not ensure either conservation or preservation of archaeological sites and materials, of course, and often building capacity to implement plans takes many years.

Nonetheless, capacity to conserve and preserve begins with a plan. Given the ever-present threats to archaeological sites and landscapes because of widespread global development, rapidly increasing exploitation of natural resources over broad landscapes and the international tourism industry, we can only expect that preservation planning will grow in importance.

It has become apparent that that environmental change can produce damage to cultural as well as natural resources. Where burgeoning agricultural, industrial, and tourism economies have produced drastic environmental change, especially hydrological, vegetative, and land cover change, the damage to archaeological sites has been severe. For example, development associated with tourism creates impervious surfaces as hotels,

restaurants, roads, and parking are built. At sites such as Petra, this has produced damaging floods as rainwater accumulates on impervious surfaces and runs, ultimately in torrents, downslope. Floods not only erode subsurface archaeological resources but also carry minerals, such as salts, which are destructive to the stone from which tombs and standing structures are formed. At sites such as Angkor, hydrological changes associated with development are equally destructive. Here, so much water is pumped from aquifers for use in hotels and restaurants that the foundations of ancient structures are undermined.

Preservation of archaeological sites requires a broad landscape approach, one that plans for sustainable development. This landscape approach also would provide the means by which to structure and control visitor flow away from sensitive archaeological resources and into already developed areas. These developed areas are places where small businesses owned by members of the local community are located. They can also be locations for museums and other interpretive facilities. Thus, visitor flow through the landscape will be directed in ways that generate community benefit and remove pressure on vulnerable archaeological sites.

Conservation in Archaeological Practice

André Bergeron
Archaeology and Ethnology, Centre de conservation du Québec, Québec, QC, Canada

Introduction

Archaeology, in itself a scientific discipline, often requires the expertise of other disciplines to help in the process of reconstructing past ways of life. According to ICOMOS's Charter for Archaeological Heritage (1990), "Archaeological heritage constitutes the basic record of past human activities. The protection of this heritage cannot be based upon the application of archaeological techniques alone (and) should be based on an effective collaboration between specialists from many different disciplines."

Whether dealing with recent history or prehistory, the contribution of related sciences such as biology, geology, geomorphology, metallurgy, and material science, to name only a few, needs no further proof. The archaeologist draws on all these disciplines to produce an overview that enhances the understanding of the history and evolution of a site. But despite this interdisciplinary approach, even today, conservators complain about the lack of integration of conservation in archaeological practice (Bergeron 1994). However, the potential of conservation for archaeology remains: whether it be for the discovery of new information, preserving transient information, or rescuing fragile elements of material culture, the conservator can provide new data to the archaeologist's approach.

For example, careful examination of the surface of objects may sometimes enable the conservator, with the help of special lighting, to discover a pattern invisible to the naked eye, to provide an analysis of surface coating which will reveal to the archaeologist valuable information on the use of the object, to understand the structure or assemblage of a composite object from fragments, and to suggest a hypothesis of reconstruction. The conservator can equally note the presence of transient elements such as impressions of plants or shells, which are lost during the stabilization treatment, or the release of the surface. The conservator's training encourages a subtle understanding of material culture: determining the structure and composition of the object is essential to adequately treat it and preserve it.

The presence of the conservator is not always necessary on many field sites, but the environmental context of certain sites demands the presence of a conservator. The consultation of a conservation specialist helps the archaeologist to plan a strategy for preservation as well as appropriate conservation measures to meet the demands of the excavation. A level sealed with clay, flooded by groundwater, or a site with permafrost constitutes environments conducive to the preservation of organic materials. The intervention of a conservator on-site greatly facilitates the acclimatization of these objects, which after having come into equilibrium with their environment for hundreds, even thousands of years, are suddenly subjected to new environmental constraints.

Definition

Conservation is defined as any action to safeguard a cultural property in the long term. The goal of conservation is to study, to document, to preserve, and to restore the essential features present in the

physical and chemical structure of cultural property, minimizing intervention as much as possible. Conservation involves examination, documentation, preventive conservation, preservation, treatment, restoration, and reconstitution (ACCR/CAC 2000).

The conservator is a person who has the training, knowledge, professional skills, and experience necessary to formulate and undertake conservation activities, in accordance with a code of ethics. Conservators are usually designated according to their domain of specialization, for example, furniture, textiles, or paintings conservators; the conservator specialized in archaeological conservation thus possesses the requisite knowledge and experience to work in collaboration with an archaeologist and their team. This conservator is competent to undertake restoration, stabilization, and preventive conservation of artifacts and structures discovered during archaeological intervention.

Historical Background

A Question of Perspective

Since its beginning, the human species has produced tangible goods whose attributes are determined in part by what is intangible in human experience: the beliefs, language, value system, and representation of the world. This immaterial heritage, which leaves no trace in the soil, influences all the production of material culture. The archaeologists concentrate their research on the portion of goods that are preserved in various states according to their immediate environment and burial conditions. The differential preservation of materials in the soil thus constitutes a limited sample that is more or less representative of the past.

Figure 1 illustrates the evolution of cultural archaeological property from some time in the past, entitled Time 0, until today:

Circle 1 illustrates the overall production of culture at a given time. The cone emerging from the center represents material culture, and the rest corresponds to intangible production: language, belief, and value system.

Circle 2 represents human activities that leave material traces.

Circle 3 indicates that only a part of these traces traverses time, the others disappear, and the archaeologist only knows a small part at the moment of discovery.

Circle 4 represents the beginning of the excavation: only one part of identified traces survives materially; the others disappear by the very fact of being uncovered.

Circle 5 shows that only part of the traces which survive the dig are spontaneously preserved; the rest disappears or is profoundly altered without appropriate measures taken. An even tinier part receives restoration treatment, sometimes years after the dig.

This narrow sample of the past indicates great responsibility of the archaeological team, as their intervention will break an equilibrium that has sometimes occurred over very long periods of time. This is what is illustrated in Hodges diagram in Fig. 2.

A Balance To Be Achieved

After abandonment, many objects will suffer some degradation according to the climate, the type of soil, the context of burial, and the speed of this burial. For some material, this degradation is rapid and inevitably leads to loss, while for others, it will sometimes slow down or even stabilize. It is thus said that the object has entered into equilibrium with its environment. The Hodges diagram is a tool that allows us to establish the relationship between the deterioration of material culture over time.

The intervention of the archaeologist upsets this balance and provokes a resurgence of the deterioration of objects, which must acclimatize to new environmental conditions. At this point, the common goal of the archaeologist and conservator is to minimize the damage by the adoption of appropriate conservation measures, whether environmental or through direct intervention on the material.

An object that loses its wholeness because of an alteration to its physical-chemical properties sees its

Conservation in Archaeological Practice, Fig. 1 Sequence of successive reductions established by Berducou (1990: 16–18)

Conservation in Archaeological Practice, Fig. 2 The Hodges diagram expresses the relationship which exists between the deterioration of material culture and time. (Extract from Dowman 1970)

potential for study and research diminishes. Often, the resulting loss of legibility will also limit its potential for exhibition. Conversely, the adoption of conservation strategies applied in the field improves the preservation of collections, which facilitates their study and promotes their development. The responsibility for preservation is here shared between the archaeologist and the conservator, who must have agreed, before the beginning of the dig, on the sharing of tasks as well as the strategies to be implemented in order to optimize the preservation of the uncovered objects.

Key Issues/Current Debates

The Intervention of the Conservator

Although human beings have always repaired objects that they used, conservation as a discipline cannot be understood without considering the development of art history and archaeology in the nineteenth century together with the appearance of the museum as an institution of knowledge. In itself, conservation is not a scientific discipline, nor an artistic undertaking, even if the two aspects play an important role. Its practice is located at the confluence of several fields of knowledge, particularly chemistry, physics, biology, material science, environmental sciences, anthropology, and the history of art, to cite only a few.

The conservator borrows from the chemist his or her workplace, namely, the laboratory, as well as the rigor of scientific research; from the historian, their capacity for interpretation; from the surgeon, the scalpel and great dexterity; and from the artist, his brushes and sensitivity. Before any intervention, the ethics of the conservator always requires a dialogue with the person responsible for the object or the collection, which may also involve the archaeologist who is responsible for the discovery. Consensus is essential to the activity of the conservator who, like the archaeologist, must constantly keep up to date with new scientific breakthroughs.

Like the archaeologist, the conservator remains on the lookout for new elements of information that could be revealed by the analysis and study of objects. An interesting example is the treatment of a bandolier discovered on the Wreck of the Elizabeth and Mary (1690). Since its discovery in 1996 (Fig. 3), this object has been examined by a conservator and specialists in material culture to try and understand its structure. Several hypotheses were proposed, but none was completely satisfactory. For some time, the best hypothesis to describe the object suggested that the paper cartridges each equipped with two lead bullets may have been wrapped in paper. An analysis suggested that the wrapping was in fact a thin layer of tin (Fig. 4), but still then, the specialists in material culture were not completely convinced. A review of all the available information this time has shown that the paper cartridges were placed in tinplate box with stiff openings. This box served to protect the cartridges during transport to the battlefield. Never used, its contents were dismantled during the excavation. It was only after many hours of observation and examination spread over 15 years that the structure of this object, its likeness never before seen in museum collections, could be specified.

Conservation in Archaeological Practice, Fig. 3 View of the bandolier 12N2-61 in situ. (Photography: Parks Canada)

Conservation in Archaeological Practice, Fig. 4 The second hypothesis of the reconstruction of the bandolier 12N2-61, developed from field data, test results, and the conservator's observations

Today, the conservator has become in some ways like a doctor for objects. Their intervention

requires an understanding of the materials and their process of decomposition. Each object is in this way documented, measured, and photographed, and all the information is recorded in a condition report. The beginning of treatment is only performed after discussion and agreement with the manager of the collection. Then, all the materials used, added, or subtracted as well as the results and the procedure of intervention are recorded in a conservation report, which becomes the memory of the transformation of the object over time. This documentation will prove invaluable if further interventions become necessary (Fig. 5).

Figure 6 is a good example of the choices that the conservator is regularly faced with: to intervene or not to intervene. This archaeological discovery, a cannonball colliding with a wooden structure, involves two materials requiring treatment and different environments for optimal preservation. However, it is by keeping them together that the significance of their message emerges; to separate them would greatly diminish their potential. In this case, as in many others, the question of the degree of intervention and of the need for long-term stabilization of the archaeological object becomes a priority for the conservator.

International Perspectives

A Different Context in the Marine Environment

Maritime heritage is a nonrenewable resource that is threatened not only by natural elements but also by ignorance and sometimes, unfortunately, looters' greed. Due to its inherent characteristics, including the difficulty of access and usually fragmentary state, its preservation requires special awareness and an important public education effort. As is the case for other types of archaeological heritage, the preservation of maritime heritage, rather than being a technical issue, is often a cultural issue.

If this fact is not constantly kept in mind, public opinion, being reassured by the techniques used by specialists, inevitably feels it can be relieved of all responsibility, while the technical process, left to itself and lacking the means to act in the cultural context, is easily reduced to the automatic application of recipes, and even risks of losing sight of the purpose that justifies it (Philipot 1986: 2).

At a marine site, the interest of the archaeologist for questions related to conservation is crucial to optimize the preservation of material culture that is uncovered. The archaeologist also has the responsibility to convince and explain to local groups (history societies and divers) the significance of his/her project as well as the limits of archaeological intervention in the absence of conservation measures. It is also the archaeologist who must meet the goals of adequate preservation, as what is optional for terrestrial sites becomes mandatory for marine sites; all the materials must receive treatment, sometimes complex, which can take several years. As Pearson recalls (1977), "in the marine domain, an excavation carried out without conservation is tantamount to vandalism." In the marine environment, it is recognized that 1 month of intensive excavation requires 1 year of conservation treatment in the workshop (Pearson 1980: 147–150). This estimation should, however, be regarded as a minimum which in certain cases can double, even triple. Figure 7 illustrates the precautions to take when retrieving a gun. To use a protective support when exiting the water ensures that the fragile object has the best chances of preservation; archaeological information conveyed by the gun can bring new data useful for research, the foundation of any archaeological approach.

If the excavation of an underwater site regularly constitutes a complex and onerous undertaking, the preservation of associated remains is equally important. In addition to the conservation of materials that are preserved for hundreds, sometimes thousands, of years due to the presence of water, the question arises of the level of intervention and its objectives. Moreover, marine sites can sometimes lead to the discovery of marine concretions which trap in their gangue numerous objects or structures carrying information. The subtle excavation of these concretions by a conservator involves some delegation of

CONSTAT D'ÉTAT			
Désignation	**Clé en fer forgé**	**CeEt-28-1A7-113** **AE-2010-25-01**	
Description	Objet plein constitué d'une seule pièce, sans assemblage, en fer forgé. Des produits de corrosion volumineux (sédiments, éléments allogènes, concrétions) empêchent de visualiser le panneton de la clé.		
Décor	Il ne semble pas y avoir de décor.		
Matériaux et techniques	Fer forgé		
État mécanique	Objet complet apparemment, et d'une bonne tenue mécanique pour la partie hors concrétion. Celle-ci ne permet pas de visualiser l'état de l'extrémité de la clé sous jacent, mais la présence de produits de corrosion indique que le fer est corrodé, et probablement en moins bon état que le fer appartenant au reste de la clé.		
Description de la corrosion	L'artefact semble avoir subi un traitement partiel: effet lustré et noir sur la tige et l'anneau, révélant sans doute que cette partie a fait l'objet non seulement d'un dégagement, mais aussi d'un traitement à l'acide tannique ou d'un convertisseur de rouille, suivi d'une application de cire micro cristalline. Aspect: la corrosion est localisée exclusivement à l'extrémité de la clé sous forme de concrétion volumineuse ; localement le long de la tige, le métal a une apparence fibreuse reflétant la structure métallurgique d'originedu fer forgé. Forme: très reconnaissable pour ce quiest de l'anneau et de la tige, mais le pannetonest non visible.		

Conservation in Archaeological Practice, Fig. 5 (continued)

État physique du métal	Présence d'un noyau métallique apparemment sain, hormis sous la concrétion: le fer semble s'être solubilisé presqu'entièrement. La surface ne révèle aucune fissure ni soulèvement dans la partie hors concrétion.	
Importance de la corrosion	Sous la concrétion, la radiographie permet de visualiser que le fer à l'état métallique a presqu'entièrement disparu. Hors concrétion, la corrosion est très peu développée et quasiment nulle.	Surface d'origine	Très lisible, hormis sous la concrétion: une double ligne plus radio opaque (blanche), mais diffuse et irrégulière permet de penser que la surface d'origine est au moins en partie conservée au niveau de la tige, mais celle-ci est peut être déplacée de son niveau d'origine. Une partie de la matière supportant cette surface a disparu au niveau du panneton.	

DIAGNOSTIC

La clé a vraisemblablement déjà fait l'objet d'un traitement qui a stoppé le processus de corrosion et modifié son aspect post fouille, en dehors de la partie en concrétion (panneton). L'objet est donc stable en l'état, hormis dans cette zone. Il est néanmoins difficile de définir comment était l'objet avant traitement. Mais, àpartir de l'état actuel, on peut avancer le diagnostic suivant:

Période d'enfouissement:

-Partie hors concrétion: Le métal a une apparence fibreuse qui reflète sa structure métallurgique d'origine. Cette aspect est significatif de la corrosion qui se produit avec les fers forgés en milieu anaérobie. Il est vraisemblable que l'objet était situé dans un milieu d'enfouissement anaérobie, probablement gorgé d'eau, favorisant une altération biologique par les bactéries sulfato-réductrices (BSR) du cycle du soufre. Durant leur métabolisme, ces bactéries libèrent dans le milieu des ions qui précipitent les ions métalliques. Ce milieu est favorable à la formation de concrétion qui forme une gangue autour du métal qui parallèlement se solubilise. Une fois recouvert de concrétion, le fer forgé se corrode préférentiellement le long des inclusions qui sont orientées selon le sens de forgeage. A l'interface métal/produits de corrosion, il en résulte une forme de corrosion particulièrequi rappelle l'apparence du grain du bois, tel que constaté sur la clé. L'état physique visible laisse donc penser que la clé était initialement recouverte complètement de concrétion.
-Partie sous la concrétion: le métal est très corrodée. Il semble avoir été presque complètement solubilisé. Cette zonepeut être ou a pu être le siège d'une corrosion active mais aussi d'une corrosion à caractère évolutif, reliée à la présence des bactéries sulfato-réductrices.

Nouvelle exposition aux conditions atmosphériques:

La partie déjà traitée est stable.
Le panneton est plus à risque en raison de la poursuite de l'activité supposée des bactéries anaérobies (corrosion évolutive), car même en condition aérobie, la concrétion fait une barrière aux échanges limitant l'apport d'oxygène sous la concrétion.
La poursuite de la corrosion active se poursuit tant qu'il subsiste un noyau métallique. Une de ses manifestations est l'apparition de gouttelettes à la surface de l'objet. Les autres manifestations sont la présence de gonflements, délitements, éclatements et fissures. Elle peut entraîner la fragilisation de la zone du panneton et possiblement sa ruine.

SUBJECT OF APPLICATION
-Stabilization and readability of objects

STATE OF OBJECT			
Designation	**Wrought iron key**	**CeEt-28-1A7-113 AE-2010-25-01**	
Description	Complete object comprised of one piece, without assembly, in wrought iron. Products resulting from extensive corrosion (sediments, foreign elements, concretions) impede visualization of the blade part of the key.		
Setting	The object does not seem to have any ornamenttion.		
Materials and Techniques	Wrought iron.		
Mechanical state	The object appears complete with good mechanical strength for the part that is not corroded. This does not allow for visualization of the blade part of the key, but the presence of corrosion on the blade indicates that the iron on this part of the key is probably in a worse condition than the iron belonging to the bow component of the key.		
Description of the corrosion	The artifact seems to have undergone partial treatment since it has a glossy, black effect on the bow and ring sections, revealing that these parts were not only subject to clearance, but also to a tannic acid treatment or a rust converter, followed by the application of microcrystalline wax. Appearance: the corrosion is localized exclusively at the blade end of the key as a large concretion; locally along the rod, the metal has a fibrous appearance reflecting the original metallurgical structure of the wrought iron. Form: very recognizable in terms of the ring and bow components, but the blade component is not visible.		
Physical state of metal	Presence of an apparently healthy metal core, except under the corrosion: the iron seems to have almost completely dissolved. The surface shows no cracks or swellings in those parts that are outside the main area of corrosion.		
Conservation in Archaeological Practice, Fig. 5 (continued)

Importance of the corrosion	Under the corrosion, the radiography makes it possible to see that the iron in the metallic state has almost entirely disappeared. Outside of the corroded section, the corrosion is largely under-developed and almost nil.	Original surface	Very readable, except under the corrosion: a double line more radio opaque (white), but diffuse and irregular suggests that the original surface is at least partially preserved at the level of the stem, but it may have moved from its original level. Part of the material supporting the surface has disappeared at the blade end of the key.	

DIAGNOSTIC

The key has probably already been the subject of treatment to stop the corrosion process. It is likely to have changed its post excavation aspect, apart from the part that is subject to corrosion.Thus, the object is in a stable state, except for the corroded area. Nonetheless, it is difficult to be certain of the condition of the object before treatment. However, from its current state, we can advance the following diagnosis:

Period of burial:

- Part outside the concretion.The metal has a fibrous appearance that reflects its original metallurgical structure. This is typical of the corrosion that occurs with forged iron in anaerobic environments. It is likely that the object was situated in an anaerobic burial environment, probably waterlogged, which promoted biological damage by sulfate-reducing bacteria. During metabolism, these bacteria release in the milieu ions that precipitate metal ions. This environment is favorable to the formation of concretion that forms a matrix around the metal that dissolves in parallel. Once covered in the concretion, the wrought iron corrodes preferentially along the inclusions that are oriented along the direction in which it was forged. At the interface of the metal/products of corrosion, this produces a particular form of corrosion that recalls the look of wood grain, such as is observed on the key. The visible physical condition therefore suggests that the key was originally completely covered in concretion.
- Part under the concretion. The metal is very corroded. It seems to have been almost completely dissolved. This area could be or may have been the seat of an active corrosion but could also be due to a natural corrosion related to the presence of sulfate-reducing bacteria.

New exposure to atmospheric conditions:
The part already treated is stable.

The blade section of the keyis more at risk due to the continued activity of assumed anaerobic bacteria (active corrosion). This is because even under aerobic conditions, the concretion is a barrier to exchanges that limit the oxygen supply under the concretion. The corrosion continues as long as there exists a metal core. One of its manifestations is the appearance of droplets on the surface of the object. Other manifestations include the presence of swelling, disintegrations, cracks and splits. These can cause brittleness of the bit zone and possibly its ruin.

Conservation in Archaeological Practice, Fig. 5 A condition report produced for an archaeological object coming from the collections secured by the Ministry of Culture and Communications

archaeological intervention, as the archaeologist is not usually equipped to combine the excavation of these shapeless masses and the preservation of objects trapped inside. Figure 8 illustrates the complex work and equipment necessary to treat a marine concretion, a task that corresponds more or less to in-laboratory excavation.

Here again, it is the dialogue and regular interaction between stakeholders that allow the achievement of a common goal. Each professional is guided by his/her own code of ethics, and every difference in the perception and interpretation of the respective roles must take place in a climate open to different practices. The actions of the

conservator, with a view to optimizing the preservation of archaeological information, must coordinate with those of the archaeologist.

Future Directions

The preservation of archaeological collections is a complex question, possessing multiple complementary facets. The main international charters provide multiple tags to guide the relations between archaeology and conservation, but they do not contain all the answers. The ultimate responsibility in the interaction between these two disciplines which study, preserve, and

Conservation in Archaeological Practice, Fig. 8 A conservator at work during the excavation of a concretion found on the Wreck of the Elizabeth and Mary. (Photography: Centre de conservation du Québec, Michel Élie)

highlight archaeological heritage must be addressed on the basis of broad principles which generate a consensus among the disciplines that compels individual professionals to engage and participate. Every stakeholder, within their field of competence, must strive to achieve the highest of standards, whether they are practical or theoretical. The preservation of cultural heritage stemming from archaeology constitutes a delicate issue, and it is essential to address it for the benefit of future generations.

Conservation in Museums

Melanie Coughlin Depcinski
Department of Anthropology, University of South Florida, Tampa, FL, USA

Introduction

The conservation of museum collections is a vital endeavor in the recovery, protection, and advocacy of the past. The protection of items that are removed from their primary context, and the information associated with that context, is part of the museum's role as a guardian of the past. Recording and preserving the past for future generations and displaying it for the enjoyment and enlightenment of present day communities all lend to the successful management of museum collections. The constantly evolving nature of museum collections necessitates that conservators and collection managers maintain longstanding collections while continuing to collect and serve institutional missions. While a myriad of factors contribute to the shape that museum collections take, standards for conservation must be applied equitably to the care of the various objects that give museums their substance.

Definition

The primary goal of conservation is to preserve the item, in both the physical and intangible sense.

Though the precise methodologies employed to undertake this effort might have changed over the years, the goals of conservators have largely remained the same. The value of an item in a museum collection is not tied only to the physical integrity of the piece. Rather, in the contemporary practice of archaeology, value is no longer bound solely to the artifact as an object, but as a manifestation of cultural adaptations to the world. Conservation is not only about protecting the object from damage or deterioration. It is about preserving the meaning and knowledge that are derived from the object and making sure that both tangible and intangible aspects of archaeological museum collections are accessible and equipped to persist into the future (Grattan and Moses 2006). On a more scientific level, the goal of conservation is to ascertain the causes and preventative measures relating to the deterioration of museum assets.

Conservators must deal with the management of collections on two levels. Conservation measures geared towards preservation and stabilization are necessary in all collection storage settings. While preventative measures deal with researching the potential harms that may come to a collection, stabilization is an issue of discovering what is causing harm to an object and how to arrest this process. Preventative procedures may include the development of appropriate storage and display areas, installation of climate control mechanisms, careful and routine analysis of materials present in the museum environment, and regular evaluations of the integrity of objects in the collection (Bradley 2005).

Key Issues/Current Debates/Future Directions/Examples

Over the past few decades, both the number and extent of museums and their collections have grown (Keene 2002). As museum collections grow and expand, so do many of the issues associated with the conservation of items in that collection. Issues of space, visibility, and staffing resources are all tied to how the growth and management of museum collections are handled and are all linked to the well being of the items in that collection. The rate at which collections are growing has been especially problematic in the case of storage. The curation crisis – the lack of space to store ever-growing museum collections – not only prohibits objects from being stored in a safe, well-managed environment, but can also limit the amount of engagement communities have with the objects in a museum's collection.

One aspect of museum-based conservation efforts is the protection and storage of the physical object. However, the preservation of the intangible knowledge associated with that object is equally essential. Without interaction in the form of display or study, the object loses its voice and its ability to open a window to the past (Grattan and Moses 2006). A careful assessment of objects up for accessioning, a renewed emphasis on research with museum collections, and the careful planning of long-term care for newly excavated objects are steps that must be taken in order to diminish issues of storage and visibility. Furthermore, an increased drive to digitize collections and provide alternative forms of access is a strategy that can address the issue of visibility. Maintaining public and scholarly avenues of access lends to the preservation of the object's integrity as part of a collection that serves the museum's mission and community.

Digitizing collections not only allows for objects to be made accessible for research and public interest via websites, but it also opens the door for greater connectivity within the museum. Digital clouds and smartphone applications have developed in a way that large amounts of information can be distributed with the touch of a screen, allowing for objects in storage to be related to those on display. Digitizing fragile items in particular can make them accessible to the public in a way that their condition would typically not allow (Forde 2006). The fragile nature of the object and its irreplaceability are often factors that drive preservation and conservation over use and demonstration. Digitization can act as an avenue for the access to these items that is frequently desired by the museum going public (Keene 2002; Forde 2006). In the case of human remains, digitization can aid in analysis and condition monitoring in ways that photographs and visual inspections may not be able to

accomplish without a risk of damage or loss (Kuzminsky and Gardiner 2012).

The conservation of material objects becomes uniquely complex when a local community has a vested interest in the life course of the collection. Some groups may wish that an object associated with their history be cared for in a way that does not adhere to traditional conservationist practices. For some, spiritual and other culturally sanctioned methods of conservation take precedence over standard practice (Grattan and Moses 2006). With the development of legislation protecting the indigenous ancestral remains of groups in the United States and Australia, the role of the conservator in handling these remains in a museum setting has become increasingly vital. Not only is it necessary to know how to effectively preserve these materials – and do so in a way that does not violate agreements made as to how human remains and funerary items must be cared for – but the history of the treatment of those items must also be carefully evaluated. In some cases, ceremonial objects that are eligible for repatriation may not be ready to reenter use safely without further conservation initiatives. In this case, the conservator's role would not only include caring for the physical remains but assuring that the treatment of those remains over the years was not in fact detrimental to the integrity of the object (Cassman and Odegaard 2004). Moreover, the job of assuring that physical and material cultural remains are treated in a respectful manner, as well as the preservation of the integrity, humanity, and, in some cases, spiritual elements associated with human remains, must also fall within the purview of conservation efforts (Cassman and Odegaard 2004).

Available personnel and funding also contribute to conservation issues (Forde 2006). Although the scientific aspect of conservation – in terms of how things deteriorate and how to arrest this process – has come a long way, it is not always possible to have a professional conservator on staff. In order to combat this issue, conservators are frequently contracted on an as needed basis and may serve a region rather than a single institution, or their duties may be rolled into those of collections managers and registrars. In many cases, like those of Canada, the United Kingdom, Australia, and the Netherlands, government or national institutions were developed to oversee and assist with the conservation of museum collections. The International Council of Museums Conservation Committee drives the professional and scientific development of conservation research on the international level (Keene 2002). In the coming decades, the digitization of collections and the sociocultural implications of collection-based legislation will continue to alter the way that conservation practices in museums must be approached.

Conservation Laboratory Design

Paul Mardikian[1] and Claudia Chemello[1,2]
[1]Terra Mare Conservation LLC, Charleston, SC, USA
[2]The Kelsey Museum of Archaeology, University of Michigan, Ann Arbor, MI, USA

Introduction

This entry presents guidelines for consideration when designing and planning the construction of a permanent archaeological conservation facility. It is hoped that this information will provide practical ideas and recommendations for archaeological projects and organizations that are considering this undertaking. The authors of this entry are mindful of the financial constraints within the fields of archaeology and cultural heritage worldwide. While recognizing the need for substantial resources to fund the construction of a permanent conservation facility, it is hoped that these guidelines may prove helpful for any size lab or project.

Whether a laboratory is designed to support a particular project for a limited period of time or is intended to become a multi-program facility, a brick and mortar conservation laboratory differs widely in scope and cost from a temporary field lab. Essential questions to be addressed prior to planning, regardless of the cost and size of the new facility, include the following: the purpose and need for the laboratory, whether there is an existing facility nationally or internationally that could serve as a template for the design and construction, and how to ensure that the design and

layout of the lab makes full use of the space to reduce operating costs and make the facility economically and environmentally sustainable in the long term.

Definition

Archaeological artifacts can be extremely vulnerable when freshly excavated and can deteriorate rapidly once removed from their context. The conservation and long-term preservation of excavated finds, whether terrestrial, waterlogged, or wet, requires specific processes and equipment that are quite different from those employed in other conservation specialties, for example, those used in fine or decorative art conservation.

The construction of a new conservation laboratory usually occurs within the context of a complex cultural, political, and economic environment. The impetus can come from a major discovery such as a shipwreck or a well-established long-term need in a particular region (King 1999, 2008; Seifert 2000; Mardikian 2004; Mardikian et al. 2016). While this is not always the case, conservation labs are sometimes integrated into a facility that encompasses the study, conservation, curation, storage, and possibly also the display of the excavated artifacts (see Figs. 1 and 2). These activities involve different spatial organizations within a lab, depending on the types of artifacts and the research and/or display goals.

Key Issues/Current Debates/Future Directions/Examples

Collaborative Planning

Effective planning for conservation depends on collaboration and a mutual understanding of archaeology and conservation's shared goals in developing an integrated approach to preservation (McCarthy 1989). The design and construction of a conservation laboratory, or the retrofit of an existing building or laboratory, also requires a multidisciplinary approach, with the conservator playing a pivotal role (Mardikian et al. 2016). One of the keys to creating a functional conservation lab is to involve experienced conservators as early as possible in the entire process from initial design development, review of construction drawings, through to final construction. This will ensure that the lab is well suited to all planned conservation activities, is safe for personnel and artifacts, and is functional and not aesthetically pleasing.

A complicated layout with poor access to essential needs, such as power, water, ventilation, and adequate light, can severely compromise a lab's functionality. Good communication with the architect, mechanical engineers, contractors,

Conservation Laboratory Design, Fig. 1 General view of conservation lab at the Japanese Institute of Anatolian Archaeology at Kaman-Kalehöyük, Turkey. (Photo courtesy of the Japanese Institute of Anatolian Archaeology)

Conservation Laboratory Design, Fig. 2 View of large conservation area at the Maryland Archaeological Conservation Laboratory (MAC Lab). St Leonard Maryland, USA. (Photo courtesy of the MAC Lab)

and other stakeholders will ensure that these objectives are met. If possible, visits to other conservation laboratories that have a similar scope of work are recommended.

Flexible Design and Layout

The type of archaeological site or sites to be excavated, whether wet, dry, or both, and the archaeological research goals of the project will directly influence planning for the construction of a new lab, as well as the internal layout and equipment needed for the lab. It is essential that the lab is flexible in its design and layout to accommodate different phases of an excavation, or different excavation teams, if needed. An important requirement of lab design is to limit the functional conservation space to one level. Heavy, oversize, and extremely fragile objects are easier to deal with without the need for elevators or overhead cranes.

Most terrestrial archaeological sites typically yield small- to medium-sized objects, sometimes in very large quantities, generally with relatively straightforward handling and storage requirements. Conversely, wet or waterlogged sites, and particularly marine sites, can involve large quantities of extremely fragile, wet materials such as wood, ceramic, or metal artifacts. These materials have immediate stability problems following excavation; can be extremely fragile, heavy, and difficult to transport and move; and require wet storage before and during treatment.

Underwater excavations that produce oversize artifacts present additional challenges when designing a conservation lab. The layout of the lab must address the need for extra space to accommodate suitable lifting equipment such as overhead cranes or forklifts and have an easy approach and entrance to the lab with appropriate door size for large artifacts. Large tanks for the impregnation of oversized waterlogged timbers or entire shipwrecks with polyethylene glycol (PEG), or for the desalination of large iron artifacts in caustic solutions, require a large amount of floor space and adequate drainage. Additional storage tanks may be required for temporary storage of chemical solutions or effluents prior to safe discharge.

In exceptional cases, the artifact itself is a self-contained archaeological site requiring a very specific environment. An example is the recovery and excavation of the American Civil War era submarine *H.L. Hunley* (1864) (Mardikian 2004). The excavation of the *Hunley* took place in a controlled environment within a specially constructed conservation laboratory (see Fig. 3). Following recovery,

Conservation Laboratory Design, Fig. 3 View of the *H.L. Hunley* excavation tank at the Warren Lasch Conservation Center in Charleston, South Carolina, USA. (Photo courtesy of Friends of the Hunley, Inc.)

the submarine was placed in a 340 m^3 (90,000 US gallon) tank containing refrigerated fresh water. An impressed current protection system was used to minimize the corrosion of the iron hull without having to use corrosion inhibitors that could have damaged the organic materials found on the submarine, particularly the degraded human remains and textiles. During the multiyear excavation, the tank was drained on a daily basis and refilled at the end of each day using an automated system. Exterior tanks were used for temporary storage of tank water during excavation of the vessel.

The excavation of human, animal, and other organic remains can require additional lab space for examination, treatment, or rehousing, especially if multiple burials are excavated. If excavated from waterlogged, wet, or frozen sites, these finds can present further challenges in lab design and layout. Conservation of these materials may require specialized equipment such as large walk-in cold storage, freeze dryers, and filtrated baths. Conservation of human, animal, or organic remains from terrestrial sites is also challenging due to the fragility of the material and, in arid environments, the extreme desiccation of the finds.

Task-Specific Lab Spaces and Lab Environment

Another important aspect to consider in the design of a conservation lab is the need for separate lab spaces to deal with "wet," "dirty," and "clean" tasks. Wet areas of the lab can be useful for dealing with waterlogged material or wet tasks such as desalination of artifacts affected by soluble salts like glass or ceramics. Certain conservation activities can generate a large amount of dirt and dust that should, ideally, be separated from processes such as documentation, photography, packing, and rehousing that require a relatively clean, dust-free space. Areas of the lab for dirty work should be easily cleaned and floors coated with hardwearing, chemical-resistant materials. If possible, all electrical cables, water, and compressed air hoses should be mounted to the walls or ceilings on heavy-duty, extra-long retractable reels, allowing easy access from different parts of the lab, as well as outside the lab if needed.

Tasks such as the cleaning of waterlogged artifacts, especially large marine concretions, and excavated block lifts from terrestrial sites can be particularly messy. One option when planning these tasks is to designate an area outside and adjacent to the lab where such activities can take place. If exterior spaces are sheltered, they may also be used as additional space for the treatment of artifacts or chemical storage. Areas of the lab where heavy pneumatic or electric tools are used, for example, grinding and abrasive equipment for cleaning metal artifacts, should be as isolated as

possible to prevent excessive noise and impact on the air quality in the rest of the lab.

All areas of the lab where heavy equipment is used should be fitted with adequate fume, dust, and particle extraction units. Hard ducted hoods or portable units with proper filters should be planned into the lab's design, with at least one chemical-proof fume hood, as shown in Fig. 4. This particular fume hood includes an oversized stainless steel sink, which have access to hot, cold, and deionized water, as well as compressed air. It also allows sufficient leg space for conservators to work comfortably in a seated position.

Control of the environment in a conservation lab may be extremely difficult depending on the construction materials used and the physical location of the lab. The temperature and relative humidity in the lab should be as stable as possible for the personnel but also to the level that is required by the materials being treated. The method by which the environment is controlled may vary throughout the lab. Very precise control achieved via complex mechanical systems may be necessary in discreet areas of the lab, particularly for areas where artifacts like damp or wet organic materials, metal, or salt-laden ceramics are housed and treated. However, more passive means of control, for example, by the use of a desiccating agent, may be a more cost-effective way to achieve localized control for unstable objects. Air movement is also important, particularly in hot and humid countries where strict environmental control is not feasible. The installation of ceiling fans will help with air circulation. Cross-ventilation, a high ceiling, and adequate insulation will also help to buffer and stabilize the internal environment.

Conservation Laboratory Design, Fig. 4 Custom-made fume hood with stainless steel sink specifically designed for the Hunley Project at the Warren Lasch Conservation Center in Charleston, South Carolina, USA. (Photo courtesy of Friends of the Hunley, Inc.)

Transportation, handling, and storage of excavated artifacts from the excavation site to the laboratory are often challenging, particularly of large, fragile material. To avoid damage, it is imperative to plan ahead of time for artifact movement with a continuous, obstacle-free path available from the excavation site to the conservation lab and within the lab. Smooth floor surfaces are essential when transporting fragile or heavy artifacts. Likewise, adequate planning for artifact storage before and during treatment is necessary, with consideration of the environment that the artifacts will require during different stages of the conservation process, as well as allowing access to the materials for research. If a conservation lab must also function as a storage facility, the design and layout of the lab must contain adequate space to store finds before and after conservation, in addition to the space that is needed while conservation is underway. Long-term artifact storage requires the installation of appropriate storage furniture, for example, shelving units suitable for the volume and weight of the excavated finds.

Another consideration is whether conservation activities should be on view to the public. Access should refrain from direct disturbance of the daily activities of the lab, particularly when large tour groups are involved. One option is to plan for large bay windows overlooking the conservation area. This allows direct and safe viewing of the conservators at work, particularly when working on large artifacts, as shown in Fig. 5.

Conservation Laboratory Design, Fig. 5 General lab view showing ongoing conservation work on the USS *Monitor* Project and public viewing through lab window. Norfolk News, Virginia, USA. (Photo courtesy of the Monitor Project)

Laboratory Equipment and Furniture

Outfitting a conservation lab with expensive analytical and optical equipment will depend on the scope of the lab and its conservation activities and whether the lab will undertake research. An example is the use of digital radiography, which may be a practical tool for conservators to use on a daily basis, and a purchase that is financially justifiable in the long term. Large equipment such as a scanning electron microscope with energy dispersive capabilities (SEM-EDS) usually requires a dedicated technician to operate the equipment and adequate space. The operational cost of large analytical equipment is often too high for a conservation lab to justify. In most cases, it is preferable to contract these services through local universities or private research laboratories.

Industrial X-ray machines are often required to penetrate large and complex archaeological artifacts, concretions, and block lifts. These machines differ widely from X-ray units used in the medical field. Their operation requires the use of shielded cabinets or rooms in order to protect personnel from harmful ionizing radiation. The need for these shielded enclosures can restrict the size of the artifacts that can be X-rayed. Another approach is to use a portable X-ray tube that can be used either inside a lead cabinet or a shielded room, or remotely on large objects. This option offers more flexibility but also requires stringent radiation safety requirements and trained operators. These factors can weigh considerably on the budget of a laboratory and require careful planning with the architect. It may be preferable in the long term to invest in a computed radiography (CR) or direct radiography (DR) X-ray system rather than a conventional system using photographic film and wet processing facilities. In computed radiography, an imaging plate is used to create the digital image, which is then transferred to the computer, while direct radiography captures the image directly on a panel detector. The use of these systems enables fast processing of images and eliminates the chemicals used for developing film. As these chemicals are considered as hazardous waste and require special disposal, CR and DR are far more environmentally friendly and sustainable in the long term than conventional film radiography.

If local tap water is unsuitable for the desalination of artifacts due to the presence of excess chlorine or mineral salts, a reverse osmosis unit or a deionized water column may be needed. These two systems can also be combined to produce very pure water if required. Water treatment systems should be scaled to the size of the laboratory and nature of the activity, particularly when dealing with artifacts affected by soluble salts absorbed from the burial context. When feasible, rainwater may be collected for use in treatment, provided that it is filtered and stored in the dark to help avoid biological growth.

The purchase of lab furniture also requires a flexible approach. Conventional, built-in furniture,

such as bench tops permanently attached to the walls, may not be appropriate for a multipurpose space, with the exception of sinks. Sinks should preferably be made of stainless steel, be wide and shallow, and have direct access to hot, cold, and deionized water. A heavy-duty sink sprayer is useful for cleaning the sink and filling portable containers. When dealing with artifacts from a marine environment, it is preferable to use a grade 316 stainless steel which is much more resistant to pitting corrosion from chloride ions released during deconcretion. Modular or custom-designed furniture and storage will allow more flexibility to adjust to the specific conservation requirements of individual artifacts. For example, the use of adjustable height heavy-duty stainless steel tables mounted on locking casters is recommended to create mobile work surfaces. Adequate lighting is critical for conservation work, and good general lighting should be available in the lab. In addition, task-specific lighting from portable lights is suitable for a large space and allows greater flexibility.

Conservation, Restoration, and Preservation in Classical Archaeology

Roberto Nardi
Centro di Conservazione Archeologica – Roma (CCA), Rome, Italy

Introduction

A common terminology developed for the conservation of cultural heritage, adopted at the 2008

ICOM-CC (International Council of Museum Committee for Conservation conference, New Delhi), has removed ambiguity and helped conservation and restoration specialists to communicate more clearly and accurately. Museum managers, art historians, conservators, archaeologists, the public, and the media use the ICOM-CC definitions in order to preserve archaeological and cultural sites and artifacts more effectively than they were able to do previously by relying on encyclopedias and dictionaries. Different cultures and languages – including the Anglo-Saxon languages and Latin in particular – assigned different meanings to terms, which created confusion and led to misunderstanding about how preservation should be carried out.

Definition

The ICOM-CC terminology was developed during a decade of consultation among conservation and restoration specialists.

Conservation – all measures and actions aimed at safeguarding tangible cultural heritage while ensuring its accessibility to both present and future generations. Conservation embraces preventive conservation, remedial conservation, and restoration. All measures and actions should respect the significance and the physical properties of the cultural heritage item.

Preventive conservation – all measures and actions aimed at avoiding and minimizing future deterioration or loss. These are carried out within the context or on the surroundings of an item, but more often a group of items, whatever their age and condition might be. These measures and actions are indirect – they do not interfere with the materials and structures of the items. These methods do not modify their appearance. Examples of preventive conservation are appropriate measures and actions for registration, storage, handling, packing and transportation, security, environmental management (light, humidity and pollution, and pest control), emergency planning, education of staff, public awareness, and legal compliance.

Remedial conservation – all actions directly applied to an item or a group of items aimed at arresting current damaging processes or reinforcing their structure. These actions are only carried out when the items are in such a fragile condition or deteriorating at such a rate that they could be lost in a relatively short time. These actions sometimes modify the appearance of the items. Examples of remedial conservation are disinfestation of textiles, desalination of ceramics, deacidification of paper, dehydration of wet archaeological materials, stabilization of corroded metals, consolidation of mural paintings, and removing weeds from mosaics.

Restoration – all actions directly applied to a single and stable item aimed at facilitating its appreciation, understanding, and use. These actions are only carried out when the item has lost part of its significance or function through past alteration or deterioration. They are based on respect for the original material. Most often, such actions modify the appearance of the item. Examples of restoration are retouching a painting, reassembling a broken sculpture, reshaping a basket, and filling losses on a glass vessel.

Key Issues/Current Debates/Future Directions/Examples

Conservation measures and actions can sometimes have more than one purpose. For instance, varnish removal, the application of protective coatings, and the reburial of mosaics can be both preventive and remedial conservation. Conservation is complex and demands the collaboration of qualified professionals. In particular, any project involving direct actions over cultural heritage requires a conservator/restorer.

The word "conservation" embraces in its present definition three different disciplines that indicate different activities linked by a common aim represented by the preservation of tangible heritage and of the cultural message embedded in archaeological assets. These disciplines have a very distinct history that, in some respects, goes back to ancient times; however, they can now be interpreted as a unified whole.

Traces of restoration have been found on monuments and items brought to light by means of archaeological fieldwork. Such traces show us

that people always have had an impulse to repair materials that constitutes today's cultural heritage (Cagiano De Azavedo 1952). Damage occurred during the execution of art works, for example, the breaking down of sculpted elements of the monumental funerary art. Damage also occurred by accident due to robberies, wars, or by the prolonged use of objects and surfaces. We often encounter simple repairs such as those to damaged parts of mosaic floors, which were fixed with new *tesserae* without paying attention to the motifs, the welding of broken vases with bronze staples, or the mimetic replacement of lost or broken marble elements to recover the functionality and aesthetic of sculptures or monumental architecture also constitute examples of ancient repairs.

The Roman town of Pompeii itself, for example, was undergoing a series of restorations at the moment of the fatal eruption of Mt. Vesuvius in 79 BCE. These repairs were part of a plan to recover from the earthquake of c. 62 BCE. Even ancient sources describe restoration as a habitual activity.

In ancient literary sources, we can find names of restorers and examples of restoration, such as the one mentioned by Pliny on the statue of Janus in the Roman Forum (Plin. *HN* 34.33). The hand of Janus had been reconstructed; his fingers indicated the number of days in a year after the calendar reform promulgated by Caesar in 46 BCE (Pliny). All of these works were characterized by the will to restore either the function of the artwork, its aesthetic appearance, or both, all the while erasing the damage.

In ancient times, together with the activities defined as restoration, great care was taken to lengthen the durability of art work through constant maintenance, an activity that today we would call "remedial conservation." As maintenance, the surfaces were cleaned and the most appropriate kind of protective films were applied according to the material of the artwork. It is now taken for granted that lime was used on Roman monuments with a protective function; painted surfaces of marble sculptures were periodically replaced and protected with waxes, while oils and bituminous resins were applied to the damaged gilding of bronzes. During the Middle Ages, the attitude toward ancient art is one of reutilization, recycling the materials in order to build modern artworks instead of restoring the lost function of the works of art (Rossi Pinelli 1986). This attitude was already present in the ancient world; parts of sculptures and monuments were modified or replaced according to ideological aims. For instance, the *damnatio memoriae* led to the modification of the bronze statue from Cape Misenum in order to transform the face of Domitian into that of Nerva; the statue is on exhibit at Naples' Museo Nazionale today; heads of heroic statues have been replaced to glorify the virtues of Roman emperors. Sculptural elements have been reused or reprocessed to build monuments and artworks of high symbolic value.

The main archaeological discoveries during the Italian Renaissance led to a series of activities that we can define as "restoration": the increasing requests of art works by collectors and enthusiasts of the ancient led sculptures and artists to "embellish" and "complete" archaeological remains; special care was dedicated to the statues through reconstructions and mimetic integrations of mutilated parts. Concerning the repairs of Palazzo della Valle's court conducted in 1520 by the Tuscan sculptor Lorenzo Lotti (known as Lorenzetto) in Rome, Vasari himself wrote:

> *E nel vero hanno molta più grazia queste anticaglie in questa maniera restaurate che non hanno que' tronchi imperfetti e le membra senza capo o in altro modo difettose e tronche* (These antiquities restored in this way have more grace compared to those imperfect trunks and bodies with no head or with other imperfections). (Vasari 1568)

Many artists and architects were engaged in prestigious restorations in this period such as the Antonine Column in Rome, where the works were directed by Domenico Fontana and commissioned by Pope Sixtus V. The Laocoön statue group, discovered on Rome's Esquiline hill in 1506, was restored first by Baccio Bandinelli and then by Giovanni Angelo Montorsoli. The reconstructive intent of the restorations combined the willingness to maintain philological rigor in respecting the ancient with the aim to reconstruct the original appearance of the artworks. To achieve this final goal, people involved in

restorations emulated the technical methodology used to create the artworks in the first place. The profession of the restorer started to emerge when integrative restoration became common in the seventeenth century; being a restorer was previously considered not as important as artistic activity. Benvenuto Cellini was a sixteenth century artist who restored the sculpture collection of Cosimo de Medici in Florence. He defined restoration as *occupazionedi artista mediocre, onde egli adattossi a condurre un restauro solo per far cosa grata al suo Principe* ("an occupation for a mediocre artist, often done just to please his Prince") (Cellini and Camesasca 1985).

It was the century of the restoration of the collection of Ludovisi's sculptures with Gian Domenico Bernini, Ippolito Buzzi, and Alessandro Algardi all involved in the works. The first specialist treatises on the topic emerge in this period, a first effort to systematize and standardize from the technical point of view the interventions on artworks. Orfeo Boselli, sculptor and restorer, wrote his *Osservazioni sulla scultura antica* between 1642 and 1663 and dedicated the thirteenth chapter to restoration. The chapter has become a precious source of documentation on methodology of integration, techniques, and material used at the time of the sculpture's restoration (Boselli 1978). The restorer's profile had a slow evolution until a proper recognition in the 1700s. Large numbers of travelers visited archaeological and art sites at that time during their Grand Tour, fostering a new blooming antiques market. During this century, the antiquarian discipline evolved into archaeological science, thanks to the work of the German scholar Johann Joachim Winckelmann. His theories led to a new concept of restoration; this development incurred with the encounter of Bartolomeo Cavaceppi, sculptor and restorer engaged with the restoration of the Albani collection. Winckelmann, being an expert, was in charge of his training as requested by the Cardinal. Antiquities started to be seen as original documents that needed to be studied in order to be fully appreciated for their historic and literary values. Restoration according to Winckelmann had become a cognitive experience, requiring careful study and knowledge of the ancient work before an intervention; this meant that professionals had to renounce any creative personal interpretation.

The professional relationship between Winckelmann and Cavaceppi led to the development of the discipline as an autonomous activity with respect to artistic disciplines, anticipating today's interaction between the art historian, the archaeologist, and the restorer – a fundamental combination of expertise to complete the conservation cycle. Cavaceppi dedicated a long chapter to restoration in his work published between 1768 and 1772. He gives technical indications together with indications of theoretical and methodological nature such as *Non per altro si restaura che per apprendervi* ("We restore to learn"), marking a turning point in the emerging profession of the restorer (Cavaceppi 1772).

The emergence of the discipline of Classical archaeology in the 1800s assisted in the development of a trend against the uncontrollable reconstructive restorations conducted to satisfy a flourishing market for ancient art, the new trend that would promote respect of the integrity of the original artwork and of the historical message carried by it. This school of thought spread among the field of monumental architecture. John Ruskin and William Morris founded the Anti-Restoration Movement and the Society for the Protection of Ancient Buildings with the aim of protecting monuments from "restoration in style," and progressively, the movement included sculpture and artworks in general. The culture of "the beauty of a ruin" and the taste for fragments developed and consequently the basis for a different theoretical model of restoration emerged. Antonio Canova refused Lord Elgin's commission to work on the Parthenon marbles; he instead preferred to leave them as fragments and he promoted some de-restorations when he was curator of restoration for the Vatican Museums. The distinction between the word "restoration" and "conservation" started in this period; "restoration" acquired a negative meaning being associated with a concept of reconstruction and consequently falsity, while "conservation" was interpreted as protection of the original material (Melucco 1998).

Many schools of thought emerged between hundreds of interventions of restoration from the end of the 1800s to the first decades of the 1900s. Cesare Brandi came up with a conclusive concept stating that each technical-scientific data, concerning the artifact's material object of the intervention, had to be object of critical aesthetical and historical reflection itself. Cesare Brandi's theories were published as "Teoria del Restauro" in 1963, more than two decades after the author started working on the book in the 1940s. This work constituted the methodological starting point for the operative activities of the Istituto Centrale del Restauro (ICR); Brandi founded the institute in 1939 and directed it until 1959. In his book, Brandi defines restoration as:

> *un momento metodologico del riconoscimento dell'opera d'arte, nella sua consistenza fisica e nella sua duplice polarità estetica e storica, in vista della sua trasmissione al futuro* (a methodological moment of recognition of the artwork, in his material consistence and double aesthetical and historical polarity, before his transmission to future generations). (Brandi 1963)

In his *Teoria*, the author clarified that *si restaura solo la materia dell'opera d'arte* ("only the material of the artwork is restored") and that

> *il restauro deve mirare al ristabilimento dell'unità potenziale dell'opera d'arte nella sua consistenza fisica, purché sia possibile raggiungere ciò senza commettere un falso artistico o un falso storico, e senza cancellare ogni traccia del passaggio dell'opera d'arte nel tempo* (the aim of the restoration is to recover the physical consistency of the artwork; it should be done without committing artistic or historic falsity and without erasing any signs of the artwork's history).

In Brandi's *Teoria* are collected all elements that would lead to the development of conservation as we conceive it today: reversibility and identification of the interventions, status quo's conservation, and principles of what the author calls *restauro preventivo* ("preventive restoration"); an entire chapter is dedicated to this last concept.

Brandi's theories of respect for the artworks and identification of the interventions have been fully applied through the high-level technical interventions for the large, postwar restorations of the 1950s. In this period, restoration became an essential instrument for the study and publication of historical and technical instances that were previously ignored. In the following years, we progressed toward a further evolution brought by Giovanni Urbani, an important figure in the restoration scene in the 1980s. Urbani saw the limits of a discipline that intervenes directly on a single monument at the time, with often long and expensive operations; the efficiency of those operations was compromised by the absence of "structural" intervention over the context that originated the damage restored.

It is the beginning of the evolution from restoration to conservation, development, and change of scale that would lead to this evolution at the end of the 1970s. Urbani, director of the ICR from 1973 to 1983, promoted the analysis of the causes of artwork damage in order to start working on the causes and prevent the damage, the value of the restoration and conservation benefit of the contribution of various professionals: chemists, biologist, geologist, physics that work together with specialists in restoration and conservation supporting them in understanding the microscopic scale of degrading mechanisms, materials' reactions, and efficiency of operational techniques. On the other hand, Urbani, according to Brandi's indications on preventive restoration, promotes the concept of "planned conservation" as an activity of preservation and protection of heritage on a large scale, characterized by prevention of environmental hazards and routine maintenance (Urbani and Zanardi 2000).

More and more accurate techniques of documentation emerge in this period (Nardi 1992): what was previously the occasional activity of an operator, it slowly become a systematized practice both in language and procedures; public administrations report these kind of activities in their balance sheets. Examples of application of these techniques are the identification and recorded evidence of the working process in the interpretation of marks left by historical events (Rockwell 1989), the identification of old restorations, mistakes and second thoughts, the interpretation of monuments' vertical surfaces (Nardi 1987). The documentation became the main instrument to record activities carried on during the interventions. It constituted a precious instrument to

record the state of conservation of monuments and artworks, instrumental to the study of deterioration to prevent corrective measures, preservation, and protection activities (Figs. 1 and 2).

Conservation, Restoration, and Preservation in Classical Archaeology, Fig. 1 Arch of Septimius Severus in the Roman Forum, 1983. Table of stone's deterioration mechanisms. The documentation regarding the state of conservation of monuments has slowly become a fundamental instrument for the curator/restorer. (Pictures Nardi, Copyright CCA)

With the contribution of Gael de Guichen (ICCROM, the International Centre for the Study of the Preservation and Restoration of Cultural Property in Rome), we progress to the birth of the state of art of the discipline 30 years later: preventive conservation. During the last few decades, parallel to the methodological evolution of restoration into conservation followed by the evolution of conservation into preventive conservation, the restoration changes operational scale: the interest in a single coating developed into interest for its building, from the repairs of a single object to entire collection, from the intervention on a monument to its site, from the single restorer to multidisciplinary groups. The archaeologist, the art historian, and the architect more and more often work side by side with the curator/restorer adding a fundamental humanistic contribution to connect operational technical choices to the original nature of the monument – its historical message. Examples of this interaction are the definition of the conservation principle in situ and the use, in current restorations, of materials and techniques belonging to original practices. In the past, restoration privileged the aesthetic appearance of the artwork, often destroying the context of its origin and historical message such as the destruction of monuments

Conservation, Restoration, and Preservation in Classical Archaeology, Fig. 2 Arch of Septimius Severus in the Roman Forum, 1995. The ordinary maintenance of marble surfaces is an integral part of the preventive conservation process of the monuments. (Pictures Nardi, Copyright CCA)

Conservation, Restoration, and Preservation in Classical Archaeology, Fig. 3 Zippori, Israel, 1994. The conservation in situ is the result of the encounter between archaeologist, art historian, architect, restorer/curator: their contribution is essential to bring together technical operative choices to the original nature of the monument and express its historical message. (Pictures Nardi, Copyright CCA)

Conservation, Restoration, and Preservation in Classical Archaeology, Fig. 4 Ostia Antica, 1989. The reburial of delicate archaeological surfaces, such as mosaics, represents a very efficient measure of preventive conservation. (Picture Nardi, Copyright CCA)

and sites to remove frescos and mosaics – the aim of the conservation in situ is to promote a different scenario (Fig. 3).

In the same way when it comes to materials and techniques to use in present interventions, the contribution of humanistic literature is of fundamental importance since it has led to the technical-conservative debate. For instance, in the choice of materials based on original formulas (such as the use of lime-based mortars instead of synthetic industrial products) and similar techniques to the original techniques of construction with the result of diminish the impact of invasive operation in favor of practices closer to routine and emergency maintenance rather than restoration or reconstruction (Fig. 4).

The principle of conservation led to a new approach adopted by some institutions in the

Conservation, Restoration, and Preservation in Classical Archaeology, Fig. 5 Musei Capitolini, 2000. The project "Aperto per Restauro" has allowed thousands of visitors to the museum to see the works of conservation and restoration of the Centaurs from the Villa of Hadrian at Tivoli. (Picture Costanzi Cobau, Copyright CCA)

1980s. The old Istituto Centrale del Restauro, called Istituto Superiore per la Conservazione del Restauro nowadays, conducted mainly technical courses, while the ICCROM first followed by the CCI (Canadian Conservation Institute) in Ottawa, the Université Paris-Sorbonne (Paris IV) in France, the Getty Conservation Institute in Los Angeles, and the Institute of Archaeology of University College London took the distances from the purely technical field of restoration and started new multidisciplinary courses about control of context of exhibition of artworks and study of deterioration mechanisms according to the latest methodological indications. The need to preserve, enhance, and pass on the cultural message of archaeological heritage has become an important part of the recent evolution of the profession. For example, several interventions of conservation and restoration have been conducted with free access for the public, with specific initiatives that have transformed technical intervention in cultural operations of great success (Nardi 1999) (Fig. 5). The contribution of de Guichen in supporting preventive conservation, the public acknowledgement of his ideas, and the application of his methodologies have played an important role in the modern development of the field (Fig. 6).

Conclusion

Despite the general acceptance of all this, supported by literature on the subject and various didactic programs, a lot of work needs to be done in order to spread the concept of preventive conservation among administrators and technicians, public administrations, and the daily life of monuments and sites. Doubtless, this is the path that we all should follow as curators, archaeologists, architects, art historians, and administrators, for we all have to move forward in the interest of archaeological heritage that is both unique and nonrenewable.

Constructivism in Archaeology Education

Donald Henson
York, UK
Institute of Archaeology, University College London, London, UK

C

Introduction

Archaeological remains in themselves are silent. They do not speak to us in the same way as documents or oral testimony. We have to ask questions of the evidence and judge between different interpretations. The meaning of the evidence has to be constructed by the archaeologist. In a similar way, modern teaching methods involve students learning to ask questions, to construct their own understanding of the topic being taught. This is empowering students to be active learners. Modern constructivist educational theory in the west thus has a great deal in common with archaeological theory as developed in the UK, Scandinavia, and the USA, what is broadly known as a post-processual approach in archaeology. This reinforces the utility of using archaeology for educational purposes.

Definition

Constructivism is an approach to epistemology which sees all knowledge of the world we live in as constructed by the individual. This includes scientific knowledge and knowledge gained through subjects like archaeology. Constructivism has much in common with postmodern habits of thought. If our knowledge of the world is constructed by us, then there can be no commonly accepted single interpretation of that world. Instead there is a diversity of understandings.

Within education, constructivism accepts that pupils are actively constructing their understanding of the world and are not merely empty vessels being filled with knowledge imparted by the teacher. Every child will do this through active

engagement with teaching materials and the application of their own preexisting knowledge, attitudes, and beliefs. Much constructivist education is based around problem solving, group work, and setting school subjects within a practical real-world context.

Historical Background

Among educators in the west, it was John Dewey (1867–1949) in the USA who began the constructivist revolution through his ideas about hands-on learning and matching learning to the experiences of the student (Dewey 1916). He advocated that child-centered learning is the key to good education. The three people most commonly referred to as the fathers of modern constructivist theory are Jean Piaget (1896–1980), Lev Vygotsky (1896–1934), and Jerome Bruner (b. 1915).

Piaget was concerned to discover the stages through which a child progressed during its mental development (Piaget 1950). He identified certain key points at which a child's thinking moved upwards into more complex intellectual reasoning about his or her environment. Before c.18 months, a child is dominated by a purely sensorimotor relationship to the external world. Until the age of c. 7, children are preoperational, that is, they learn by doing rather than by applying logic to work things out. From 7 to 11, children are concrete operational where they can begin to think about things before they do them and can apply logic to what they observe. At the age of c. 11, pupils develop formal operational skills where they can think logically about abstract propositions and can form hypotheses about future actions. For Piaget, there was no point in trying to teach a child something it was not intellectually equipped to understand and so teaching had to differ according the stage reached, that is, the age of the child.

Vygotsky emphasized the social interaction of children with each other and teachers as an important part of learning (Vygotsky 1962). While accepting that children of different ages had different learning capabilities, he held that social interaction could help raise a child's capability above what it could achieve on its own. Interaction involves language and the language used must be appropriate for the interaction to take place. Intelligence is therefore not so much innate as a product of social and cultural interaction.

Piaget and Vygotsky laid the foundations for an approach to education that centered on understanding how children learn. It is upon that foundation that constructivism was built. The main architect of constructivism was Jerome Bruner, who resembled Dewey in his emphasis on learning as an active process in which students or children build upon their own experience and current knowledge to construct new ideas or knowledge for themselves (Bruner 1966). Teaching is thus an active dialogue between teacher and learner, and learners needed to be keen and willing to learn (motivated) for effective teaching to take place. Forms of teaching should thus be structured to provide a relevance for their learning and carefully fit in with what children can understand. Good teachers should encourage their students' thinking to go beyond what they are being presented with. Pupils need to be enabled to construct their own learning from the materials and guidance provided by the teacher.

The overall nature of constructivist learning is that learners should be involved and empowered through communication appropriate to their level of mental development. Pupils, and adults, need to be enthused about what they are asked to learn and to feel that they are actively engaged in learning. Teachers need to learn to speak and structure what they say so that the learner can follow and understand what they are learning.

The most recent adaptation of constructivist education is by Howard Gardner, who has developed the idea that there are multiple intelligences (Gardner 1999). What he means by this is that we cannot measure intelligence in only one way. Different people will have different ways of understanding the world around them and turning that understanding into something we can measure as intelligence. It might be better to think of his multiple intelligences as multiple skills or ways of reasoning.

Gardner's intelligences are:

- Linguistic – good at understanding and using words, highly developed in writers and poets

- Logical – good with number and problem solving, found in scientists, engineers, computer programmers
- Spatial – good at visualizing abstract notions or designs, found in architects, designers, chess players
- Musical – identifying sound, pitch, and rhythm, developed in musicians, sound engineers, mechanics
- Kinesthetic – good balance, coordination, and body skills, useful for sports, dancing, etc.
- Naturalist – good at observing, recognizing patterns, and classifying the world around them, found in farmers, astronomers, etc.
- Interpersonal – people who are good with other people, good social skills, for example, teachers, counselors
- Intrapersonal – self-awareness, for example, spiritual and expressive people

Other models of constructivist learning exist and are used by teachers and educators, such as those of Benjamin Bloom and David Kolb.

Benjamin Bloom described three "domains of learning": cognitive, affective, and psychomotor (Bloom et al. 1964). The cognitive domain involves the acquisition and intellectual manipulation of knowledge. The affective domain covers our emotional responses, how we feel about things, what motivates us, and what we value. The psychomotor domain involves our use of physical movement and coordination to achieve tasks and how we develop these physical skills. Each domain needs teaching in a different way and with different levels of attainment. Some students will respond more readily within one domain than another.

David Kolb developed four "learning styles" based on how we perceive the world – by thinking or feeling and how we interact with the world – by doing or by watching (Kolb 1984). The interaction of these four poles of behavior produces four kinds of learner. The reflective observer who watches an activity or a presentation, the abstract conceptualizer who likes to think about an issue or problem, the active experimenter who likes to learn by physically doing an activity, and the concrete experiencer who likes to reflect on their emotional experience of an event. The learning cycle involves moving between each form of learning as a progression, one from the other, although any one learner may have a dominant style.

Key Issues/Current Debates

This idea of multiple intelligences is now being used in the UK to devise appropriate learning styles for different pupils and is the basis of the *Inspiring Learning for All* website produced by the former Museums, Libraries and Archives Council. Archaeology is perfectly placed to provide educational opportunities aimed at most of these kinds of learning ability, for example:

- Linguistic – writing site reports and interpretation panels
- Logical – devising excavation strategy and analyzing evidence
- Spatial – piecing together the stratigraphy of a site or a building
- Kinesthetic – the processes of fieldwork and artifact analysis
- Naturalist – recording and surveying landscapes, analyzing classes of evidence
- Interpersonal – the teamwork involved in excavation
- Intrapersonal – reflecting on our own interpretations of the past

Archaeology can therefore engage the interests of a wide variety of learners, many of whom are disengaged from traditional classroom learning. It is a common feature of school visits to museums for a school teacher to be surprised at the enthusiasm and ability of a child in the class whom they normally think of as less able when that child is given tasks to do that are better matched to its intelligences than traditional school work.

Why is archaeology such a good tool for constructivist learning? Archaeology is a set of processes applied to physical remains in the real world. It therefore provides an immediately relevant real-world context for the application of abstract skills like numeracy and literacy. The

application of skills in relevant situations is a key part of constructivist methodologies. However, it is also the processes of archaeology themselves which match well with constructivist learning. We can think of archaeological processes as forming a sequence from finding remains, recovering, recording, analyzing them, and then producing a synthesis of results as an interpretation of the past. Finding remains is more than an act of discovery. To find is also to identify and categorize remains as worth seeking out. We construct the category of archaeological site or artifact as an object of study. For many, the public image of archaeology is that of the patient and meticulous craftsman toiling away in the ground to recover and record remains during excavation. While the technical processes of excavation and survey are the bedrock of the discipline, they are only part of archaeology. Sites and finds in themselves are mute. They have to be analyzed to reveal their secrets, and this process of analysis is deeply permeated by constructed methodologies, purposes, and assumptions. We construct categories of artifact. We design research strategies to accomplish a constructed goal. Analysis is more than mere measurement. It is an attempt to understand the form and occurrence of the remains. We cannot help but construct our analysis. Likewise, taking the results of analysis and turning them into a narrative of the past is a highly constructivist task. Constructivism permeates archaeology.

Constructivism has not gone unchallenged. Many academic writers have characterized constructivism as letting children find their own understandings through unstructured inquiry-based learning. Constructivists themselves often seem averse to any idea that there is a necessary body of knowledge that needs to be imparted to pupils. Debate between the two sides usually, and unhelpfully, can often be polarized between an advocacy of acquiring knowledge and a counter-advocacy of developing skills. The center ground of the debate is concerned with the idea of scaffolding, that is, providing the necessary information to the learner to help them make sense of what they see and with which they can construct an understanding of the object of study. Skills can only be developed from a knowledge of what something is or how it works. Knowledge and skills work together to produce learning. Archaeology has knowledge in abundance: sites, artifacts, and data of all kinds. It also has many skills of analysis that help us make sense of this data and construct meanings out of the past.

Furthermore, learning theories are often criticized as not having proper experimental verification and being constructs in the minds of their advocates rather than models derived from isolation of variables, observation, and verification. The whole point of constructivism of course is that it consciously does not recognize the positivist view of knowledge creation and testability. Its relative lack of experimental verification has not stopped it being used by educators in practice.

In an important critique of the instructivist versus constructivist debate, Duffy (2009) suggested that the key difference between the two was the recognition by constructivists that learning is easier and more successful when the learner relates what they are learning to a reason for the activity of learning – that what they learn can be put to a relevant or practical use in their world. This presents a problem for archaeology. For some people it is enough that the past is a fascinating unknown world to be explored or that archaeology is a process of detection and discovery. These in themselves provide enough motivation to learn. But for many, the past is a dead place with little relevance in the present, and its investigation by archaeologists is a hobby with little practical purpose. Indeed, many archaeologists find it hard to articulate a reason for their own discipline beyond mere curiosity or conservation for the sake of it. Good constructivist learning using archaeology must involve an understanding of why we do archaeology in the first place and its importance for people in society today. Organizations like the World Archaeological Congress show how archaeology is practiced in a real and contentious world and have a key role in helping archaeologists understand their current, real-world utility and purpose.

Good constructivist teaching needs teachers to have high levels of instructional skills using problem-solving methodologies and high amounts of subject-based knowledge. Good professional development is therefore key to getting teachers to use constructivist methods. This is

especially true for teaching involving archaeology as most teachers have little expert knowledge in the subject. Archaeologist educators will therefore need to engage in teacher training and professional development as much as dealing directly with schoolchildren themselves.

One further issue that needs to be addressed derives from the relationship constructivism has to postmodernist modes of thought. If understanding of the world around us is constructed by each individual according to their own intelligences and experiences, then does this mean that all interpretations of the world are equally valid? Does a constructivist approach to learning allow the student to construct whatever meaning they wish about a topic? Such ultra-relativist positions are held by some, but most would accept that there are limits to interpretation that are based on ethics or factual knowledge. The past is a fruitful source of debate for postmodernist scholars since we can never fully know all the facts, and interpretation of the past is highly contingent rather than positivist. Archaeologists and historians construct their understandings of the past. However, to treat the past as source of ideas for the telling of literary tales ignores the factual basis of past lives and events. As the historian Richard Evans has written (Evans 1997: 124), "Auschwitz was not a discourse. It trivializes mass murder to see it as a text. The gas chambers were not a piece of rhetoric." There are necessary limits to using constructivism in education. The construction of understandings by students has to be guided and constrained by the factual nature of the day-to-day lived world of human experience.

Future Directions

The major development in education over recent years has been the introduction of computing technologies into the learning experience. Teaching is no longer the monopoly of school. Children, and adults, learn in a variety of ways in different arenas through the medium of their television, their computer (PC, laptop, tablet, etc.), their smartphone, and their experiences at places they visit with their friends or parents. The computing revolution provides an unparalleled access to vast amounts of knowledge. The task for archaeologist educators is to enable their audiences to navigate this knowledge and construct meaningful, accurate (a contentious but important word) understandings of the past. This need not be through their work with schools but through their websites, smartphone, tablet apps, etc.

This is not to say that schools can be ignored. Schools and teachers will continue to play a role in the raising of children. Archaeologists now have the capability to provide resources for teachers more widely than before through the distributed media of digital technologies. These technologies also allow more experts than before to enter the classroom through the interactive whiteboard and platforms such as Skype. We will have ever more opportunities to engage in a true dialogue with learners, helping them construct their understandings of the past. Pupils already have the ability to engage in online inquiry for themselves. The school is no longer the main source of information about subjects like archaeology. The presence of archaeology on TV has a long history in some countries (such as the UK), and its presence on screen and in other media play a key role in raising interest and directing inquiry. Our role as educators may well become that of guiding students in how to navigate multiple sources of knowledge and evaluate their value. Teachers may no longer act as sources of knowledge, but as coaches and mentors in skills of evaluating and applying information. The constructing of understanding by learners is entering a new and potentially empowering phase.

Consumption, Archaeology of

Paul R. Mullins[1] and Risto Nurmi[2]
[1]Department of Anthropology, Indiana University-Purdue University Indianapolis, Indianapolis, IN, USA
[2]University of Oulu, Oulu, Finland

Introduction

A tremendous range of archaeological studies could be construed as consumption studies because of their focus on the ways people use material goods to confirm, display, accent, mask, and imagine who they are and wish to be. Most archaeological analyses of consumption focus on mass consumption in complex societies, but a picture of consumption that examines how people make and use goods for self-definition and collective identification could be applied to virtually any archaeological context. Expanding consumption is most closely associated with the industrial revolution and the development of a global market economy in the last half millennium, but the roots of such consumption reached well into the medieval world and could contribute to an interpretive framework for nearly any archaeological study. We focus here on archaeological research that examines the agency of consumers and acknowledges that structural and localized processes alike shape the way goods assume meaning.

Definition

Archaeological scholarship on consumption emerged in the 1970s, but much of that research examines consumption as a largely reflective process that instrumentally displays social identity, ethnicity, or status or otherwise confirms some essential identities. Archaeologists have typically focused on consumption as an act of exchange, expression of self, or a moment otherwise isolable in the "life" of a good. Consumption is basically approached from two main directions in the archaeological research. Many scholars see consumption as a patterned reflection of structural constraints or people's identities that determine the sorts of goods a consumer acquires and the meanings they give to those things. The other approach considers consumption in terms of personal agency, viewing consumption as a social process in which people construct their individual, social, and cultural identities.

Consumption scholarship has most closely studied commodities, understood here as items produced specifically for exchange (Orser 1996: 191–3). During the emergence of consumer society, the stereotypical self-sufficient family economy was rearranged to a producer–distributor–acquirer chain model. Things and services became

commodities defined primarily by their exchange value (Kopytoff 1986: 68), and the people who used and needed them became consumers who acquired commodities by exchange. Commoditization separated the production, distribution, and use of things from each other.

Key Issues/Current Debates/Future Directions/Examples

Since the late 1970s, North American historical archaeologists have extensively studied the correlation between social and economic relations, aspiring to establish relationships between material consumption patterns and social and economic standing. This sort of scholarship tends to focus on how market constraints, supply, costs, and social status shape material consumption. The most influential of these early studies was John Solomon Otto's (1984) groundbreaking work at Cannon's Point Plantation in Georgia, which argued that archaeological analysis could establish patterns specific to consumers who shared the same social and economic positions. At Cannon's Point, Otto identified three social groups living alongside each other: the planter household that owned the plantation, White overseers who managed its everyday operation, and African-American captives. Otto identified clear distinctions in material culture from the three groups, ranging from distinctions in ceramic decorative types to architectural differences, concluding that the groups' consumption was a reflection of how access to goods was dictated by socioeconomic standing.

Such work on socioeconomic status and material consumption was significantly expanded in the 1980s by George Miller's (1980) study of English ceramic prices. Miller's research on English ceramic price-fixing agreements underscored that late eighteenth- through nineteenth-century English ceramics were priced primarily by decorative type. The Staffordshire price-fixing agreements revealed that undecorated cream-colored ware (known to potters as CC) was universally the most inexpensive ware available. Establishing cream-colored wares as a "baseline" against which all other ceramic prices could be measured, Miller outlined "index values" for most of the price-fixing agreements that survived between the late eighteenth and late nineteenth centuries. Using Miller's index value tables, an archaeologist can quantify the value of an assemblage and compare it to other assemblages from the same period, providing a methodological mechanism to compare ceramic consumption patterns.

Numerous North American historical archaeologists spent the 1980s calculating ceramic index values, though much of this scholarship on "socioeconomic status" ignored contextually distinct influences on consumption. Nevertheless, Miller's contributions led to a flourishing discussion of consumer behavior and consumer choice studies among North American scholars. Many of these socioeconomic status studies were included in the 1987 Suzanne Spencer-Wood edited volume Consumer Choice in Historical Archaeology. Spencer-Wood aspired to use methods like Miller's ceramic scaling indices to forge a systematic definition of socioeconomic status including factors such as market availability, ethnicity, and family size. However, she considered "income or wealth, usually determined by occupation, as the major factor limiting consumer choices" (Spencer-Wood 1987: 325).

The consumer choice approach sought to evaluate social and economic relations on the basis of choices that people make in acquiring commodities (Spencer-Wood 1987: 9–12), but such models are not especially good frameworks for interpreting consumption outside the nineteenth-century urban United States. For example, Christina Rosén's (1999: 16-7) study of Scandinavian consumption of ceramics argues that external "status display" expressions were not necessarily typical of northern Europeans. Ann Smart Martin (1996) raised much the same point in her comparison of urban and rural consumption in the colonial Chesapeake, pointing to very distinct social patterns in cities and countryside that shaped consumption patterns. Archaeological research into commodity consumption has reached outside North America since the 1980s, often contemplating the concept of socioeconomic status. The European adaptations, however, have revealed a number of problems concerning the theoretical framework of

socioeconomic status and consumer choice. Paul Courtney (1997) and Frans Verhaege (1997) highlighted the problem of adopting the traditional Marxian model of a direct transition from feudal to capitalist society in Europe, arguing that the model seriously underestimates the impact of mercantile ideology and economy on the development of modern Europe from the late medieval period to the eighteenth century (Gaimster 2009: 528). Likewise, North American consumer theory models tend to be based on conceptions of symbolic and economic value that are distinctive to urban American bourgeois, assuming public displays of stylish and costly wares in competitive status hierarchies. However, these models do not work especially well in many other contexts or early modern periods, and they may in fact be somewhat problematic even in American urban settings. People in places like northern Europe, for instance, were consuming mass-produced goods from the eighteenth century onward, but they imposed their own values, meanings, and uses based on local material and cultural practice. Northern European redware consumption patterns reflect persistent use of local ceramics for functional tasks including dining across class groups, with extensive recycling and reuse that contrasts with the urban bourgeois model of consuming cyclically stylish goods in public displays of "cost status."

Risto Nurmi's (2011) dissertation on consumption in Tornio in northern Finland in the two centuries between roughly 1600 and 1800 demonstrates that many mass-produced products were imported and traded to the town and acquired by local customers. However, Nurmi found that these goods had exceptionally long use-lives and included numerous vessels with evidence of repair, including relatively inexpensive redwares. Nurmi suggests that Tornio consumers viewed material things in quite different ways than urban bourgeois consumers who acquired cyclically stylish goods in public displays of "cost status." Market constraints did deliver a relatively homogenous range of commodities to these northern European markets, and the aesthetic homogeneity of the material assemblages from Tornio reflects quite different local rules for curation, functional use, and display of goods.

Archaeologists studying consumption initially reduced mass-produced goods to markers of "acculturation," but archaeologies of colonial encounter increasingly focus on indigenous agency. For example, Michael Dietler's (2005: 61–2) study of the early Iron Age Western Mediterranean examines how indigenous consumers influenced colonizers. Dietler argues that indigenous peoples routinely accepted some colonizers' mass-produced goods and turned others into points of resistance that complicate the picture of colonialism. Dietler indicates that early Iron Age European communities were peopled by discriminating consumers who embraced some goods of Greek colonizers, consuming massive quantities of wine and drinking material goods but rejecting many other goods. Dietler (2005: 57) suggests that the indigenous demand for imported Mediterranean trade goods was quite regionally distinctive, a conclusion that underscores the shortcomings of mechanistic models of colonization that distinguish between cores and peripheries and hazard, ignoring all of the cultural and historical contingencies of colonization. Dietler argues that archaeologies of consumption should focus on four fundamental elements: archaeological and cultural context, patterns of association, relative quantitative representation within sites and across regions, and spatial distribution of specific goods.

Like Dietler, many scholars have focused on consumer agency as a mechanism to avoid deterministic pictures of consumption dictated by market supply, advertising, and similar structural conditions. For instance, Christina Hodge's (2007) study of a c. 1720–1775 site in Newport, Rhode Island examines how "middling" households selectively appropriated genteel material practices. Hodge recovered a colorfully decorated tin-glazed earthenware assemblage that was apparently used alongside pewter, which breaks with Georgian dining styles favoring individual matching vessels (Hodge 2007: 438). Yet the household consumed other Georgian forms, including punch and tea drinking vessels that suggest a favor for "fashionable drinking" over formal dining. Hodge argues that this piecemeal adoption of dominant practices illustrates

consumer agency that did not simply reproduce gentry materialism.

Some archaeologists have examined consumption as agency that is wielded tactically (if not strategically) against domination. In about 1892, for instance, an African-American household in Annapolis, Maryland filled a cellar with household refuse that included 79 bottles, and nearly all were from nationally advertised brands and did not include any local marketer (Mullins 1999). Rather than interpret this simply as assimilation to the mass market, some African-American households were probably consuming brand goods to circumvent local racism. Local White marketers who bottled their own goods persistently provided poor quality or adulterated goods for their Black customers and sold such goods at less competitive prices than those offered to many of their White neighbors, but nationally produced and priced goods evaded such racist tactics. Some African-American brand allegiance certainly revealed that African Americans sought some measure of genteel standing, and an 1875 probate inventory from the Annapolis home confirmed that the home included stylish decorative furnishings such as mahogany chairs in a room decorated with chromolithographs and figurines (Mullins 1999: 29).

Nearly any archaeological study could cast itself as a consumption study, so the question revolves around specifically how archaeology's picture of everyday materiality reveals the ways people negotiate, accept, and resist goods' meanings within specific contexts. Rather than reduce all consumption simply to a reflection of market determinism or inflate the agency within all material consumption, the most interesting scholarship focuses on the persistent tensions between structural and localized processes. This casts consumption as a study of dominant marketing, state, and social conditions even as it acknowledges that consumers acquire things to confirm, mask, and imagine who we are and who we wish to be. The dual influences of structural factors and consumer agency provide a rich framework for interpreting material consumption in a vast breadth of archaeological studies.

Contemporary and Historical Archaeology in Theory (CHAT)

Dan Hicks
Institute of Archaeology, Pitt Rivers Museum, University of Oxford, Oxford, UK

Brief Definition of the Topic

CHAT – Contemporary and Historical Archaeology in Theory – is a conference group focused on the study of the archaeology of the postmedieval and contemporary world. The group was set up by Dan Hicks and Angela Piccini (then teaching the MA programs in Historical Archaeology and Archaeology for Screen Media at the University of Bristol) in February 2003. Hicks and Piccini formed a standing committee – including Mary Beaudry, Sarah Tarlow, Tadhg O'Keeffe, Eleanor Casella, and David Austin – and organized the first meeting at Bristol in November 2003, with keynote papers given by Mary Beaudry and Victor Buchli. The first meeting comprised four sessions – on the themes of "the archaeology of colonial and postcolonial worlds," "archaeology and popular culture," "connection and evocation: beyond explanation in archaeology," and "archaeology as political action."

The purpose of the establishment of the group was, in part, to develop a new, informal forum for the development of approaches and exchanges in the archaeological study of the recent past – distinct from those then offered by the meetings of the Society for Post-Medieval Archaeology, the Association for Industrial Archaeology, or the Society for Historical Archaeology. But its main aim was to bring together the archaeological study of the early modern, modern, and contemporary worlds: connecting modern archaeology with material culture studies rather than purely with economic and social history.

The format for the conference – a full schedule of short papers in plenary, themed sessions – has been retained at the annual meetings of the group that have been held since 2003: at the University of Leicester (2004), University College Dublin (2005), University of Bristol (2006), University of Sheffield (2007), University College London (2008), the University of Oxford (2009), University of Aberdeen (2010), Boston University (2011), and the University of York (2012). The founding standing committee was committed to ensuring that their composition would change over time, and many stood down in 2008 to allow CHAT contributors to take the group in new directions. Through the energy of new standing committee members including Sefryn Penrose, Rodney Harrison, Jeff Oliver, Krysta Ryzewski, James Symonds, Laura McAtackney, Sarah May, and James Dixon, the CHAT group has retained the atmosphere of the first meetings.

A series of publications have developed from the meetings, including the contributions to the "Studies in Contemporary and Historical Archaeology" series, several of which are based on the proceedings of CHAT meetings. However, the principal outcomes of the group have been new connections between archaeological researchers interested in working at the temporal boundaries between anthropology and archaeology, and it is by the vibrancy of these exchanges and collaborations that the ongoing success of the group continues to be judged.

Contemporary Past, Archaeology of the

Alfredo González-Ruibal
Institute of Heritage Sciences (Incipit), Spanish National Research Council (CSIC), Santiago de Compostela, Spain

Introduction

The archaeology of the contemporary past is a new and interdisciplinary field of research that intersects with heritage studies, art, ethnography, and modern history. This kind of archaeology, as it is practiced today, was born in the late 1990s. However, its intellectual roots go further back (Harrison 2011: 144–9). While *archaeology* literally means the study of ancient things, archaeologists have always been concerned with the present, although in very different ways. During the nineteenth century, there was no clear-cut division between present and past, archaeology and anthropology, and prehistory books regularly included living societies (but always non-industrial). This perspective soon fell into disrepute due to its inherent racism and simplistic evolutionism. From the late 1950s onward, archaeologists renewed their interest in the contemporary world through a new method – ethnoarchaeology – and a new theory: processualism. As in the previous century, it was traditional groups that were targeted: other societies were not studied. This is because ethnoarchaeology was conducted for the sake of developing analogies to understand the past, not as an end in itself to understand the present.

Definition

The proliferation of archaeologies of the recent past has produced a diversity of definitions for the subfield. One of the main issues is time. In the United Kingdom, the archaeology of the contemporary past tends to focus on the last 50 years (Harrison and Schofield 2010). From this point of view, the goal of the archaeology of the contemporary would be the study of our present society in the strict sense, following one of the definitions of *contemporary* as that which exists synchronically. It also fits a period that has been characterized as postmodern or high modern. For the study of a longer period, the term *archaeology of the recent past* is preferred. The problem with this approach is that, on the one hand, it privileges a period defined by theorists and culture critics which is not necessarily relevant archaeologically. On the other hand, the division may hamper an adequate comprehension of the present day within longer historical trends. There are two ways in which this problem has been dealt with: some archaeologists prefer to dissolve the uniqueness of late modernity and of modernity in general (Dawdy 2010), whereas others have tried to characterize the late modern phase archaeologically within the trajectories of modernity (González-Ruibal 2008; Olivier 2008). In the latter case, the move implies an extension of the boundaries of the contemporary past beyond what is strictly contemporary. With this definition, another meaning of *contemporary* is privileged – what belongs to the same period of time. From this perspective, we can say that we are contemporaries of First World War soldiers, even if no one is alive

anymore, because we live in the same historical phase. In a similar vein, some archaeologists project the contemporary even further back in time to the mid-nineteenth century, for both historical and methodological reasons. This might be helpful for filling the gap left by historical archaeology, which tends to focus primarily on the period before the late nineteenth century while simultaneously forces us to see connections between present processes and those of the recent past. Other authors explicitly reject the phase approach and instead consider the archaeology of the contemporary past as the study of all relations between past and present (Holtorf and Piccini 2009). In any case, all authors agree that in approaching the most recent past from an archaeological point of view forces us to rethink modernist temporalities and transgress the well-ordered time frames of conventional archaeology (González-Ruibal 2008; Olivier 2008; Holtorf and Piccini 2009; Harrison 2011).

A lingering problem with the definition of the archaeology of the contemporary past is its equation with the *archaeology of us* (Gould and Schiffer 1981), this *us* being equated to *Western*. It is true that late modern societies present problems of their own and deserve to be studied specifically. Yet this should not lead us to reduce the archaeology of the contemporary past to one kind of societies only (reversing the discrimination of ethnoarchaeologists). Although some practitioners have worked in both Western and non-Western contexts, there is still an important unbalance with the geographic scope of the subdiscipline, and the amount of non-Western archaeologists working on the recent past is still limited. What do not seem to have limits are the topics explored by this archaeology: a few of them will be described in the following sections.

Historical Background

Despite their overt lack of concern for contemporary communities, processual archaeologists, like Lewis Binford, paved the way for an archaeological study of the present. On the one hand, unlike culture-historical archaeologists, processualists were not concerned with particular periods and cultures, but with understanding human behavior and social processes in general – and this could include the present. On the other hand, processual archaeologists who decided to do ethnographic work with living communities did so because many issues in which they were interested were usually overlooked by ethnographers (garbage, abandonment, recycling, settlement patterns, technology, etc.). With their detailed archaeological documentation, ethnoarchaeologists did prove the relevance of archaeological method to see the present differently.

There was only one further step to be taken: to study the present for its own sake. This occurred in the mid-1970s in the United States. Instead of looking at non-modern communities, a group of archaeologists decided to focus on their own culture and in this way inaugurated a new field: the *archaeology of us*. Its leading proponents were William Rathje, Richard Gould, and Michael Schiffer (Gould and Schiffer 1981), who went on to produce influential work on garbage, modern technology, and contemporary disasters. Despite this promising start, archaeological studies of the present did not take root. A similar interest in modern material culture developed in the early 1980s in the United Kingdom, with the emergent post-processual archaeology. Although some archaeologists engaged with contemporary things, the field was mostly taken over by anthropologists and lost much of its archaeological edge.

It can be argued that the archaeology of the contemporary past was reborn again in 2001 when the seminal book *Archaeologies of the Contemporary Past* (Buchli and Lucas 2001a) was published. The introductory chapters by the editors provided, for the first time, a strong theoretical background to the archaeological study of the recent past, which still grounds in one way or the other the large majority of the research. Other events in the United Kingdom explain the consolidation of the subdiscipline: the establishment of the Contemporary and Historical Archaeology in Theory (CHAT) annual conferences in 2003; the work of English Heritage, which has been faced with the task of managing the unwieldy remnants of the twentieth century; and the publication of the

first handbook on the archaeology of the contemporary past (Harrison and Schofield 2010). The archaeology of the contemporary past, however, has not only developed in the Anglo-Saxon world. Often simultaneously, archaeologies of the present time have emerged in Argentina, Chile, Iran, Spain, France, and the Scandinavian countries.

Key Issues/Current Debates

Everyday Life

Everyday life is the main concern of what could be called the British school of archaeology of the contemporary past which revolves around CHAT. Archaeologists associated with this school have cast their archaeological gaze on the world that surrounds them and have investigated furniture, graffiti, highways, malls, zoos, and even virtual worlds, to mention but a few things (cf. Holtorf and Piccini 2009; Harrison and Schofield 2010). One of the most controversial projects in this line was the archaeological excavation of a van from 1991 that had been used by an archaeological team for about 15 years. The evidence was analyzed through a combination of customary archaeometric methods (Bailey et al. 2009) and an object-biography approach, which has been consistently applied to prehistoric and ancient contexts over the last two decades (http://www.archaeologychannel.org/content/film/festival2008/InTransit.htm). As it happens with much of this kind of work, the conclusions were not precisely counterintuitive, but this was probably not the point. What the van excavation and similar projects do is to encourage us to look at our world (and archaeology) in a different way. It is more a creative engagement with ordinary materiality than an interpretative work (cf. Harrison 2011).

However, archaeology can also allow us to go deeper and in more detail into other people's lives and reveal something of them. This is the case with abandoned houses where everything has been left behind. The objects that have been abandoned following a catastrophic event can tell intimate stories about ordinary women and men. Thus, Dezhamkhooy and Papoli Yazdi (2010) excavated several houses in Bam (Iran) that collapsed following a major earthquake in 2003. In their powerful work, they introduce us to six Iranian families through the objects left in their destroyed homes. In this way, archaeology manages to keep alive something of those persons and becomes a poetical memory practice. A similar investigation was undertaken by Buchli and Lucas (2001b) in a council house in the UK that had been recently abandoned by its occupiers: a young unmarried woman and her two children. The study documented many intimate details of the woman's sad life story: the archaeologists suggest that the house was abandoned in the wake of a relationship breakdown with a heroin-addict partner. Similar intimate stories can be documented in the rural houses that were abandoned during the second half of the twentieth century in Galicia (Spain) (González-Ruibal 2005). Due to a desire to break with a peasant past that was perceived as shameful, the owners of many of these houses decided never to return to them and often abandoned many personal objects behind, such as photographs and letters, which allow us to piece together personal stories, often tragic (Fig. 1). This kind of work confronts the archaeologist with an ethical dilemma: is it legitimate to break into other people's life? Although the identity of the people is not revealed, we get to know too much about them, things that the subjects would probably not like to be disclosed. It can be argued, however, that archaeology can become a sort of memory work for the people without history and, in fact, most of the situations studied by archaeologists have to do with anonymous, often humble, people that rarely make it into history books.

Indeed, a concern with the less gentle side of everyday life has characterized the archaeology of the contemporary. This includes analyses of the *microphysics of power*, such as the studies carried out on school and domestic architecture or on the destructive operations that sustain consumption in the Western world. The asymmetries and inequalities within the West are also being addressed by archaeologists interested in homelessness. Some projects in the UK and the USA are conducted as community archaeology, with an active involvement of homeless people. Other subaltern groups

Contemporary Past, Archaeology of the, Fig. 1 A house abandoned in Galicia (Spain) during the 1960s

have attracted the attention of archaeologists, too, such as migrant laborers and miners in the United States.

Conflict

The archaeological study of modern conflict has grown exponentially in recent years. Starting from battlefield archaeology, archaeologists of modern conflict are now covering wider ground (cf. Schofield et al. 2002). The archaeology of the First World War has been relevant in the development of the subfield. Archaeologists and amateurs, as in other areas, have worked closely together, and they have mostly focused on the experiences of common soldiers fighting in the trenches of the Western Front. Researchers have also studied memorials, graffiti, and trench-art. More recently, the field has expanded geographically and thematically, to include other scenarios and topics, such as the Great Arab Revolt and POW camps. Comparatively, the other major conflict of the twentieth century, the Second World War, has received little attention. An important part of the work conducted so far has been carried out as part of heritage management programs (CRM). Interestingly, archaeological research on the Second World War is far from being centered on conventional battlefields. The British Home Front and the Blitz, for instance, have been thoroughly studied by Gabriel Moshenska (e.g., 2009), who has looked at air-raid shelters, shrapnel collecting by children, and bombed out civilian houses. He has excavated the latter in the context of innovative projects of community archaeology. Something that characterizes twentieth-century conflicts is precisely the blurring between combatants and noncombatants. This can be seen materially in the destruction of cities (Fig. 2) but also in concentration camps: similar technologies of repression were used to control civilians and military personnel – see examples in Myers and Moshenska (2011). Another aspect of the war to which archaeology can contribute is its impact on non-Western societies: in places like Ethiopia, some indigenous groups were first exposed to modernity through the war machinery of Italy and the Allies.

Paradoxically, more archaeological work has been produced on the Cold War than on the other conflicts, despite being a more recent conflict and not having many proper battlefields. Again, research has often been driven by heritage concerns. Most endeavors have focused on the UK and the USA, where nuclear silos, military factories, and bases have been catalogued, studied, and, sometimes, opened to the public. The

Contemporary Past, Archaeology of the, Fig. 2 The facade of a civilian building in Sarajevo riddled with bullet holes during the Bosnian War (1992–1995)

material effects of the Cold War in communist countries have been less studied (with the exception of East Germany), but some initiatives have already been undertaken, in places like Cuba and Ethiopia. Countries in Africa and Asia often suffered the hottest side of the Cold War, and their lands became the testing grounds of war machinery, which was then left to rust. This provides a significant area of research for archaeologists.

The last global war, the so-called War on Terror, is also being scrutinized by archaeologists. They have been working on detention camps, the destructive effects of terrorism in New York, and its memorialization. Finally, the archaeology of local (or rather glocal) wars is also contributing to the wider debate. This is the case with the Spanish Civil War. Although mass graves have been the main goal of researchers and grassroots associations, other initiatives have aimed at landscapes of conflict more generally, including battlefields, concentration camps, and prisons.

Dictatorship and Human Rights Violations

One of the phenomena that have characterized the last 100 years of global history is dictatorship. The study of this political phenomenon could be considered part of conflict archaeology, but in fact it goes well beyond it and intersects with other areas of study, such as everyday life and industry. Archaeological work on this issue has a triple purpose: throwing light on the material strategies that made those regimes work (and fail), providing incriminating evidence for the courts (such as the ICC), and helping the mourning process of victims and relatives. The archaeology of human rights violations is usually associated with the exhumation of mass graves. Archaeologists have participated in the recovery of bodies of victims of political cleansing in almost every continent, and the recovered evidence has often played an important role in incriminating perpetrators. One of the problems with this work is that since it is used in court, as in the former Yugoslavia, it is confidential and cannot be published. This is not a problem when perpetrators will not be taken to justice, as in Spain.

The archaeology of dictatorship cannot be reduced to mass graves, though. Researchers also investigate strategies of social engineering, control, and punishment. One of the most promising fields of research is the archaeology of concentration camps (Myers and Moshenska 2011). It is there where the horror of totalitarianism can be better grasped, by revealing the work of repressive technologies and recovering the traces of the individual lives that were shattered. The personal objects housed in the Museum of Auschwitz are a well-known testimony to Nazi barbarity. Similar evidence has been recovered during excavations at other camps and provides a unique corpus of data on the Jewish communities of Central Europe before their extermination.

Nevertheless, dictatorships cannot be based on systematic terror alone. They also rely on the seduction of the masses. Practices aimed at attaining hegemony are often material: architecture and landscape are two of the areas where totalitarianism strove to impress the people (Fig. 3).

Archaeologists, however, have paid more attention to openly repressive practices than to

Contemporary Past, Archaeology of the, Fig. 3 Seducing the masses: a communist-period mural in Berlin

the construction of totalitarian order. An exception is the study of the Bükeberg arena, where the Nazis celebrated a Harvest Festival which summoned hundreds of thousands of people every year. The scenario was cleverly devised to cause the highest impact on the masses: a 600-m-long alley (*Führerweg*) flanked by flagpoles was laid out for Hitler to "walk through the people" before reaching the tribune (Burström and Gelderblom 2011). Fascist Italian colonialism used space to imprint in the local population the idea of the colonizers' racial superiority, and Soviet urbanism resorted to large avenues and plazas to create dramatic scenarios of power (Andreassen et al. 2010). Apart from studying how these strategies work, archaeology can also explore the ways in which people survived totalitarianism. In the Soviet town of Pyramiden, Andreassen et al. (2010) have documented the *customization* of domestic space, but they found no open criticisms to the regime, in the shape of graffiti, vandalism, or similar. Due to its rigidity and disregard for actual human needs, totalitarian dreams often fail. The abandoned farms planned by Mussolini's regime in Sicily are proof of fascism's inability to adapt to local necessities.

While social repression and violence are immediately associated with dictatorship, democratic regimes can also employ them. During the first third of the twentieth century, for instance, the labor movement suffered bloody attacks at the hands of liberal governments. Archaeologists have excavated the remains of the mining camp of Ludlow (Colorado), where striking miners and their families were killed by the US Army (Larkin and McGuire 2009). Another case of a totalitarian strategy deployed by a democratic regime is that of Delta Camp in Guantanamo, where prisoners of war are held in contravention of international treaties.

Industry

Industrial archaeology was one of the first archaeologies of the recent past to appear and is now a well-established field in itself. The industrial ruins of the last 100 years, however, have received less attention than older ones. Efforts have been devoted recently to document the changing industrial landscape of the United Kingdom: new phenomena such as nuclear power, renewable energy, and shopping malls have substantially changed the cultural landscape here. Apart from chronology, there is another bias in industrial archaeology that has to be overcome: its focus on Euro-American countries. The effects of industrialization in other continents have been less studied,

Contemporary Past, Archaeology of the, Fig. 4 An abandoned gas station belonging to a ruined industrial complex from the late 1980s, Metekel (Ethiopia)

although there is a plethora of themes worth exploring: development projects in the Third World (Fig. 4), outsourcing, and industrialization in former communist nations. Regarding industrialization beyond the West, an interesting case is Flora Vilches' study of the nitrate mining town of Chacabuco (Chile) (Vilches 2011). After mining stopped in 1938, the place was abandoned only to be reoccupied as an internment camp during the Pinochet regime. Vilches shows the connections and continuities between a regimented working space under a liberal government and a disciplinary surveillance space under dictatorship. An example of communist industrialization is the aforementioned study conducted by Andreassen et al. (2010) in the ruins of the Soviet mining town of Pyramiden. The place was not vacated until 1998, and everything was left in place then, a phenomenon that allowed the researchers to have a glimpse into a vanished era. While archaeologists have been much concerned with the archaeology of industry, they have been less interested in processes of deindustrialization, despite the many ruins that they leave behind.

A kind of industry that is specific of the last half century is the one related to space technology. Archaeologists have explored issues related to space junk, rocket ranges, landing sites, and the way in which this particular heritage is managed, appropriated, and contested.

Ruins and Garbage

Modern ruins and garbage are both the raw material and a theme of study for the archaeologists of the recent past. The interest in ruination is shared with scholars from other disciplines. In fact, archaeologists have discovered paradoxically late that ruins are an interesting phenomenon per se (Fig. 5), not just a medium to obtain other information (cf. González-Ruibal 2005; Andreassen et al. 2010; Dawdy 2010). Geographers, anthropologists, and cultural historians have also offered important insights which are relevant for archaeology. Ruination itself is the focus of Andreassen et al. (2010), who have combined both art and archaeology to produce a powerful account of Pyramiden. It is at the same time an intimate exploration of the abandoned settlement and a reflection on the nature of ruins.

Modern ruins produce a fascination that goes well beyond the limits of academia, as shown by the proliferation of coffee-table books with impressive photographs of abandoned places and derelict buildings and the emergence of a singular phenomenon: urban exploration. Archaeologists have yet to engage in a dialogue with these new

Contemporary Past, Archaeology of the, Fig. 5 Ruins of an unfinished resort on the island of Corisco (Equatorial Guinea), early twenty-first century

participants. Their explorations and the often extraordinary documentation that they produce also challenge professionals: in which sense is an archaeological take on ruins different from that of amateurs? What can archaeologists add? The same questions are pertinent for the relationship between archaeological research and that conducted by scholars from other disciplines. It can be argued, on the one hand, that archaeologists have a unique methodology, which allows them to produce richly textured narratives. On the other hand, as social scientists, we can contextualize the phenomenon of ruination within long-term material processes and combine the micro-history of particular ruins with the macro-history of modernity.

Regarding garbage, its *discovery* was partly due to the New Archaeology's concern with formation processes: discard, recycling, and refuse were central concepts in ethnoarchaeology and behavioral archaeology. William Rathje went a step forward when he decided to study garbage in an industrial society as a means to understand social issues related to that society, not in an analogical way (Rathje and Murphy 1992). Rathje proved that discarded objects can tell a story wildly different from the one reported by consumers. Apart from the sociological interest, garbology has had an important practical role in raising awareness among Americans of the importance of recycling and the repercussions of unbridled consumerism.

Future Directions

The archaeology of the contemporary past has progressed much during the last decade. Although it is true that the subdiscipline – as Harrison (2011) has argued – has been more welcomed than criticized by other archaeologists, the truth is that it runs the risk of becoming ghettoized, as another area of expertise within the wider discipline. This would be regrettable because the archaeology of the contemporary world is in a privileged position to address in novel ways crucial archaeological concerns, such as rhetoric, materiality, politics, and memory (González-Ruibal 2008). It can also actively contribute to problematize concepts of heritage and time (Olivier 2008; Harrison and Schofield 2010; Harrison 2011). In addition, due to its hybrid character and its focus on issues of current relevance, this archaeology can be a way of starting fruitful dialogues with other disciplines, not in a subordinate role, as has often been the case, but in equal terms. Finally, the archaeology of recent phenomena easily engages a wide public and

allows people to rethink critically their own society. To avoid turning it into a scholarly exercise, archaeologists have to keep imagining ways in which their work can be relevant for other archaeologists, other researchers, and society as a whole.

In fact, there are some promising areas of research that may help establish bridges with other disciplines and with society: as it has been pointed out, there is a disproportion of studies between the West (and particularly the Anglo-Saxon world) and the rest. Besides, those that have worked in non-Western contexts have often emphasized poverty and violence. While this is a fundamental part of life for many people in Africa, Asia, or Latin America, there are many aspects of daily life that would benefit from an archaeological approach, such as the construction and use of domestic space or the appropriation of foreign technologies. In fact, the material creativity of shanty towns that is so important for the social life of their inhabitants has been largely disregarded: an archaeological gaze has much to offer.

Perhaps the most important challenge for an archaeology of the contemporary past, however, lies in producing ambitious works. So far, this subfield has been mostly concerned with offering commentary on contemporary life. It has engaged in micronarratives, often forgetting the larger picture. Along with micronarratives and creative interventions, the archaeology of the contemporary past should also construct elaborate accounts of complex issues – with an archaeological perspective: some themes that deserve monographic treatment are the postindustrial metropolis, urban poverty, political resistance and revolution, decolonization, global economic crises, the effects of climate change, and migration, to mention but a few. The idea is to not just engage in specific case studies but, as archaeologists of other periods do, develop coherent, synthetic approaches to those large-scale phenomena. Starting from essentially archaeological topics such as materiality, ruins, fragmentation, and time, archaeology should be able to craft rich, alternative visions to those proposed by history, sociology, or anthropology.

C

Convention for the Protection of Cultural Property in the Event of Armed Conflict (1954)

Friedrich Schipper
University of Vienna, Vienna, Austria

Introduction

The Convention for the Protection of Cultural Property in the Event of Armed Conflict, in regard to the place and year of its adoption also known as the "1954 Hague Convention", is an international treaty adopted on May 14, 1954, in The Hague, Netherlands. It is aimed at the protection of cultural property against destruction or damage, as well as theft, looting, or other forms of unlawful seizure but also military use during periods of armed conflict. The Convention contains 40 articles in the main text and 21 articles in separately drafted Regulations for its execution, which include specific requirements for the monitoring of the Convention and the so-called Special Protection regime. The provisions of the Convention were supplemented and specified in two protocols, the First Protocol of May 14, 1954, and the Second Protocol of March 26, 1999, both likewise adopted in The Hague. The First Protocol contains 15 paragraphs delivering provisions to prevent the export of cultural property by a Party to the Convention from the occupied territory of another

Party and regulates the return of illegally exported cultural property. With 47 articles, the Second Protocol serves the extension and amendment of the provisions of the Convention and its revision in those areas, where their implementation over the decades had proven to be inadequate, in particular introducing the Enhanced Protection regime. All three agreements are part of International Humanitarian Law (formerly also Law of Armed Conflict). UNESCO is primarily responsible for monitoring compliance with the Convention; in this regard it is partly supported by the UNESCO-affiliated NGO network of the Blue Shield, consisting of the International Committee of the Blue Shield (in Paris) and various national committees primarily in countries Party to the Convention, which form together the Association of National Committees of the Blue Shield (in The Hague).

Historical Background

The idea that cultural property should be protected in armed conflicts is relatively young; the thought was unknown in ancient to medieval periods, if one disregards the principle of asylum of sanctuaries. Regulations by the Austrian Empress Maria Theresa and the claim of the Vienna Congress in 1814 (in response to the looting of cultural property in the course of the Napoleonic campaigns), the General Order № 100 of U.S. President Abraham Lincoln to the Union troops during the American Civil War (Lieber Code of 1863) as well as the regulations of the Brussels Declaration of 1874, not to destroy works of art during war and not to remove them from their place of origin, constitute the important steps towards the protection of cultural property in wartime.

The first international treaty, which contained provisions for the protection of cultural property during war, was the 1899 adopted and in 1907 slightly modified Hague Convention. Article 27 requires the attacking Party to spare (as much as possible) historical sites, educational institutions, and institutions with religious, charitable, scientific, or artistic importance in sieges and bombardments. The attacked Party is required to identify appropriate buildings, whereby the type of marking was not suggested or even specified. In addition, Article 56 contains a generally worded prohibition of confiscation, destruction, or damage of such facilities.

The first international treaty that dealt exclusively with the protection of cultural property in the event of war was the Treaty on Protection of Artistic and Scientific Institutions and Historic Monuments signed in 1935 by the American States, in regard to the place of its adoption also known as the Washington Treaty or more commonly after its initiator – the Russian lawyer, painter, writer, philosopher, and archaeologist Nicholas Roerich – the Roerich Pact. It contains eight articles and includes several significant innovations compared with the general provisions of the Articles 27 and 56 respectively of the Hague Conventions. The treaty established the neutral status of historic monuments, museums, scientific and artistic institutions, as well as educational and cultural facilities – comparable to the neutral status of medical personnel and facilities. The Parties to the treaty were required to submit lists of the monuments and facilities, for which they request protection in accordance with the treaty, to the Pan American Union, which should then pass these lists to all State Parties.

After the 2nd World War – and in light of the massive looting and destruction of cultural property during this war – the Convention for the Protection of Cultural Property in the Event of Armed Conflict emerged within UNESCO on the initiative of the Netherlands.

Key Issues

Legal Validity

The Convention and the First Protocol generally entered into force on August 7, 1956, in accordance with Article 33 and the Second Protocol on March 9, 2004, in accordance with Article 43. The Convention and the Protocols "*enter into force, for each High Contracting Party, three months after the deposit of its instrument of ratification or accession*" according to Article 33 paragraph 3. As of April 1, 2013, 126 states are parties to the

Convention; 102 states have signed the First Protocol, and the Second Protocol was signed by 64 states.

According to Article 18, the Convention applies to every armed conflict between two or more Contracting Parties and in the case of the occupation of the territory of a Contracting Party. In non-international armed conflicts on the territory of a Contracting Party, all parties in the conflict are obliged to at least comply with and apply the provisions of the Convention to respect cultural property.

In states which have not signed the Convention, it is not in force and therefore not generally applicable, provided that this is not otherwise regulated in the Convention. Thus, Article 18, paragraph 3, states that "*if one of the Powers in conflict is not a Party to the present Convention, the Powers which are Parties thereto shall nevertheless remain bound by it in their mutual relations. They shall furthermore be bound by the Convention, in relation to the said Power, if the latter has declared, that it accepts the provisions thereof and so long as it applies them*."

Under Article 37, a Contracting Party may denounce the Convention, although the provisions of the Convention do not lose their effectiveness until 1 year after termination.

Definitions of Key Terms in Accordance with the Convention

According to Article 1, the term "cultural property" is defined as:

> (a) movable or immovable property of great importance to the cultural heritage of every people, such as monuments of architecture, art or history, whether religious or secular; archaeological sites; groups of buildings which, as a whole, are of historical or artistic interest; works of art; manuscripts, books and other objects of artistic, historical or archaeological interest; as well as scientific collections and important collections of books or archives or of reproductions of the property defined above;
> (b) buildings whose main and effective purpose is to preserve or exhibit the movable cultural property defined in sub-paragraph (a) such as museums, large libraries and depositories of archives, and refuges intended to shelter, in the event of armed conflict, the movable cultural property defined in sub-paragraph (a);
> (c) centers containing a large amount of cultural property as defined in sub-paragraphs (a) and (b), to be known as 'centers containing monuments.'

Archaeological sites and archaeological objects are here explicitly mentioned as "cultural property" as defined by the Convention and thus every time implicitly referred to when the Convention speaks of "cultural property."

In Article 2, the term "protection" of cultural property is defined as "*the safeguarding of and respect for such property.*" The concept of "*safeguarding*" is defined in Article 3 and the concept of "*respect*" is defined in Article 4. Measures of "safeguarding" are basically those that are undertaken "*in time of peace*" for "*cultural property situated within their own territory against the foreseeable effects of an armed conflict*"; how these measures have to be designed remains the responsibility of the national states as Contracting Parties. The respect for cultural property, however, concerns all measures in the event of an armed conflict. Article 4, paragraph 1, requires the Contracting Parties to "*respect cultural property situated within their own territory as well as within the territory of other High Contracting Parties by refraining from any use of the property and its immediate surroundings or of the appliances in use for its protection for purposes which are likely to expose it to destruction or damage in the event of armed conflict; and by refraining from any act of hostility, directed against such property.*" And paragraph 3 requires the Contracting Parties "*to prohibit, prevent and, if necessary, put a stop to any form of theft, pillage or misappropriation of, and any acts of vandalism directed against, cultural property.*" And "*They shall refrain from requisitioning movable cultural property situated in the territory of another High Contracting Party.*"

As late as Article 18, the term "armed conflict" is, in the scope of the Convention, defined as:

> 1. . . . the event of declared war or of any other armed conflict which may arise between two or more of the High Contracting Parties, even if the

state of war is not recognized by, one or more of them.

2. . . . all cases of partial or total occupation of the territory of a High Contracting Party, even if the said occupation meets with no armed resistance.

With Article 19 the area of application is extended to include "*the event of an armed conflict not of an international character*." With Article 5 additional provisions in the event of an occupation – as a special form of armed conflict – are elaborated on.

Key Provisions of the 1954 Hague Convention

In Article 4, paragraph 2, the exemption of "*military necessity*" is introduced in the principles of the Convention, thereby not further defining what the term "*necessity*" actually means. Based on this, this exemption is with Article 11 transferred to the provisions of the special security and allowing a waiver of that status during an armed conflict under certain circumstances, including, for example, an "*unavoidable military necessity*," the term "*unavoidable*" not being further defined. The issue of "*military necessity*" is dealt with in more detail in the Second Protocol (see below).

Article 5 deals with the case of occupation and generally states that the occupying force "*shall as far as possible support the competent national authorities of the occupied country in safeguarding and preserving its cultural property.*" Beyond this obligation it shall "*take measures to preserve cultural property situated in occupied territory and damaged by military operations*" if the competent national authorities are unable to do so. Beyond these basic provisions, the Convention does not contain further obligations or restrictions to the occupying force, e.g., no prohibition of handling cultural property in any way and also no prohibition of archaeological excavation. The whole problematic issue is dealt with in some more detail in the Second Protocol (see below).

With Article 6 the "distinctive emblem" of the Convention is introduced: "*In accordance with the provisions of Article 16, cultural property may bear a distinctive emblem so as to facilitate its recognition*." This is the Blue Shield, the design of which is described in Article 16 as "*a shield, pointed below, persaltire blue and white (a shield consisting of a royal-blue square, one of the angles of which forms the point of the shield, and of a royal-blue triangle above the square, the space on either side being taken up by a white triangle)*." Its use is specified in Article 17, whereas paragraph 4 generally states: "*The distinctive emblem may not be placed on any immovable cultural property unless at the same time there is displayed an authorization duly dated and signed by the competent authority of the High Contracting Party*." According to Article 20 of the Regulations, the marking of cultural property with the Blue Shield is not a requirement but just an option. In fact, many Contracting Parties have so far omitted use of the emblem.

Article 7 describes the basic military measures, to which the Contracting Parties are already committed in time of peace, namely, "*to introduce in time of peace into their military regulations or instructions such provisions as may ensure observance of the present Convention, and to foster in the members of their armed forces a spirit of respect for the culture and cultural property of all peoples*" and "*to plan or establish in peacetime, within their armed forces, services or specialist personnel whose purpose will be to secure respect for cultural property and to co-operate with the civilian authorities responsible for safeguarding it*." Although Article 7 has a military key function for an effective protection of cultural property, only a few Contracting Parties have implemented these provisions in a comprehensive and sustainable manner. Thus, the idea of the protection of cultural property is in most nation states already missing at the political level of national security and defense doctrines. Therefore, there is hardly any national armed force that has adopted its own guidelines for the military protection of cultural property, and therefore, the issue of cultural property protection has hardly found entry into any rules of engagement of those military units that are also actually deployed onto missions. There are only very few national armed forces that consistently educate expert officers (e.g., liaison officers) for the protection of cultural property. And cultural property protection

is in most nation states barely or not at all anchored in the curricula of its military personnel, for commissioned as well as noncommissioned officers. This has as a consequence, among others, that even commanders in the field fail to recognize cultural property, which is particularly true of archaeological sites and other archaeological structures of a non-monumental character.

Articles 8 to 11 regulate the issue of Special Protection for certain cultural property. According to Article 8 this includes "*a limited number of refuges intended to shelter movable cultural property in the event of armed conflict, of centers containing monuments and other immovable cultural property of very great importance*." Requirement for the granting of special protection is that the relevant objects "*are situated at an adequate distance from any large industrial center or from any important military objective constituting a vulnerable point*" (subparagraph 1a) and "*are not used for military purposes*" (subparagraph 1b), whereas the guarding of cultural property by, e.g., police, is not viewed as military use (paragraph 4). The granting of special protection furthermore requires the registration in the International Register of Cultural Property under Special Protection (paragraph 6). Cultural property under Special Protection counts as inviolable (Article 9). According to Article 17 the emblem of the Convention is to be used in triplicate for cultural property under Special Protection, as well as in single copy for all other cultural property to be protected, for the staff responsible for the protection of personnel, and for appropriate identity cards. This important issue is dealt with under the term Enhanced Protection in the Second Protocol (see below).

Articles 12 to 14 regulate the transport of cultural property. Thus, transport relocating cultural property can also be placed under Special Protection (Article 12). According to Article 14, transported cultural property is granted "*immunity from seizure, placing in prize, or capture*," which does not limit the "*right of visit and search*." Article 15 obliges Contracting Parties to respect the personnel protecting the cultural property, and in case of capture, the staff may not be prevented from carrying out their work.

Articles 20 to 28 contain the provisions for the execution of the Convention. They, among others, specify the role of protecting powers (Art. 21 and 22), as well as of UNESCO (23). In addition, Article 25 includes an obligation to disperse the agreement in peacetime and during conflict, for example, through training in the military and civilian sectors. According to Article 28, the parties are required to prosecute violations of the agreement in penal or disciplinary terms.

The final provisions in Articles 29 to 40 regulate, among other things, the signature, the ratification, the accession, the entry into force, the amendment, and the termination of the Convention. In Article 36 the relationship of the Convention to previous conventions is regulated and established and states that the Convention supplements the provisions of the Hague Conventions of 1899 and 1907 respectively as well as the Roerich Pact of 1935, given the Contracting Parties are bound to these previous conventions.

Important Provisions of the Second Protocol of 1999

Articles 5 to 9 supplement the general provisions of the Convention regarding protection. Article 5 covers the safeguarding of cultural property and defines, as minimum security measures in peacetime, "*the preparation of inventories, the planning of emergency measures for protection against fire or structural collapse, the preparation for the removal of movable cultural property or the provision for adequate* in situ *protection of such property, and the designation of competent authorities responsible for the safeguarding of cultural property.*" Article 6 increases the provisions for respecting cultural property. Thus, as subparagraph (a) points out, hostile acts directed against cultural property that are carried out on the basis of an "*imperative* (sic!) *military necessity*" must be limited to the duration "*i. that cultural property has, by its function, been made into a military objective; and ii. there is no feasible alternative available to obtain a similar military advantage to that offered by directing an act of hostility against that objective*." Similar restrictions apply to the military use of cultural property through which it is exposed to the risk of

destruction or damage. On the basis of this provision, each attack must be preceded by an effective warning. In Article 7 precautions during military operations are defined, through which damage to the cultural property protected is to be prevented as much as possible. Article 8 analogously commits the conflict parties to remove cultural property from the vicinity of military targets or otherwise to protect and prevent the installation of military targets in the vicinity of cultural heritage.

Article 9 specifies the provisions in case of occupation and establishes the rule that an occupying power in the occupied territory must prohibit and prevent:

1. (a) any illicit export, other removal or transfer of ownership of cultural property;

   (b) any archaeological excavation, save where this is strictly required to safeguard, record or preserve cultural property;

   (c) any alteration to, or change of use of, cultural property which is intended to conceal or destroy cultural, historical or scientific evidence.
2. Any archaeological excavation of, alteration to, or change of use of, cultural property in occupied territory shall, unless circumstances do not permit, be carried out in close co-operation with the competent national authorities of the occupied territory.

Therefore, Article 9 explicitly addresses the conduct of archaeological excavation, limits it in occupied territory to rescue excavation in paragraph 1b, and demands the cooperation with competent national authorities in paragraph 2.

Articles 10 to 14 contain the provisions for "enhanced protection," which represent an alternative to the "special protection" of the Convention that has in part been experienced as insufficient. According to Article 10, cultural property may be placed under enhanced protection if:

(a) it is cultural heritage of the greatest importance for humanity;
(b) it is protected by adequate domestic legal and administrative measures recognising its exceptional cultural and historic value and ensuring the highest level of protection;
(c) it is not used for military purposes or to shield military sites and a declaration has been made by the Party which has control over the cultural property, confirming that it will not be so used.

Article 11 regulates the granting of "enhanced protection" by an appropriate committee of UNESCO (i.e., the Committee, which is constituted with Articles 24 to 27) involving the Contracting Parties and "*non-governmental organizations with relevant expertise*" (Art. 11, paragraph 3), such as *expressis verbis* the International Committee of Blue Shield. According to Article 12, inviolability applies to cultural property under enhanced protection comparable with the special protection of the Convention. Articles 13 and 14 regulate the loss as well as the suspension and cancellation of enhanced protection.

Articles 15 to 21 contain provisions on the "criminal responsibility and jurisdiction." These therefore represent, in addition to the system of enhanced protection, the main innovation of the Second Protocol and a fundamental improvement in regard to the Convention. Article 15, paragraph 1, defines five serious violations of the protection of cultural property during armed conflict:

(a) making cultural property under enhanced protection the object of attack;
(b) using cultural property under enhanced protection or its immediate surroundings in support of military action;
(c) extensive destruction or appropriation of cultural property protected under the Convention and this Protocol;
(d) making cultural property protected under the Convention and this Protocol the object of attack;
(e) theft, pillage or misappropriation of, or acts of vandalism directed against cultural property protected under the Convention.

The Contracting Parties are, according to the Second Protocol and also according to their respective national legislation, required to place these offences under penalty. The other articles regulate this in respect to jurisdiction (16), criminal prosecution (17), extradition (18), and mutual legal assistance (19–20) and furthermore also measure to prevent violations of the other provisions of the Convention and the Second Protocol (21).

Article 22 basically provides, parallel to Article 19 of the Convention, the applicability of the Second Protocol in conflicts of non-international character (paragraph 1) but introduces five limitations of the applicability (paragraph 2–6), essentially addressing the issue of "*internal disturbances and tensions, such as riots, isolated and sporadic acts of violence and other acts of a similar nature,*" and finally suggests – as already in the case of the Convention – UNESCO as a mediator in these conflicts (paragraph 7).

In Articles 20 to 29 institutional issues are dealt with, such as meetings of the Contracting Parties (Article 23) and the establishment of a Committee for the Protection of Cultural Property during armed conflict in Articles 24 to 28. With Article 27, paragraph 3, the importance of the participation of "*non-governmental organizations having objectives similar to those of the Convention, its First Protocol and this Protocol*" (cf. also Article 11, paragraph 3) is again highlighted in relation to the Committee; expressis verbis "*the International Committee of the Blue Shield (ICBS) and its constituent bodies*" as well as ICCROM and ICRC are mentioned. With Article 29, a Fund for the Protection of Cultural Property in the Event of Armed Conflict is established.

The provisions of Articles 30 to 33 relate to the dissemination of the Second Protocol to which the parties are committed, as well as the international cooperation and support, also by UNESCO. In Article 30, it is explicitly stated that the armed forces of a Contracting Party have to "*incorporate guidelines and instructions on the protection of cultural property in their military regulations*" (paragraph 3a) and their distribution among members of the armed forces which is one of the main desiderata with many armed forces in reality (cf. above).

Articles 34 to 38 contain the rules for the execution of the Second Protocol, thus in Article 34 the function of the Protecting Powers, and in Articles 35 and 36 arbitrations in conflicts of opinion concerning the interpretation of the Second Protocol. The final provisions for signature and ratification, accession and entry into force, and termination are contained in Articles 39 to 47.

Relation Between the Convention and the Geneva Additional Protocols I and II

Before the provisions of the Convention were extended and refined by the Second Protocol, the first two of the now three Additional Geneva Protocols were implemented in 1977, whose primary objective is to increase the effectiveness of the protection of the Geneva Convention of 1949. These Additional Geneva Protocols thereby address – unlike the Geneva Convention itself – the protection of cultural property.

The Additional Protocol to the Geneva Convention of August 12, 1949, on the Protection of Victims of International Armed Conflicts (Protocol I), adopted in Geneva on June 8, 1977, explicates in Article 53, on the "Protection of cultural objects and of places of worship":

> Without prejudice to the provisions of the Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict of 14 May 1954, and of other relevant international instruments, it is prohibited:
> (a) to commit any acts of hostility directed against the historic monuments, works of art or places of worship which constitute the cultural or spiritual heritage of peoples;
> (b) to use such objects in support of the military effort;
> (c) to make such objects the object of reprisals.

The Additional Protocol to the Geneva Convention of August 12, 1949, on the Protection of Victims of Non-International Armed Conflicts (Protocol II), adopted in Geneva on June 8, 1977, explicates in Article 16, on the "Protection of cultural objects and of places of worship":

> Without prejudice to the provisions of the Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict of 14 May 1954, it is prohibited to commit any acts of hostility directed against historic monuments, works of art or places of worship which constitute the cultural or spiritual heritage of peoples, and to use them in support of the military effort.

With these two Additional Geneva Protocols, the basic principles of the Hague Convention of 1954 are incorporated into the Geneva Convention and thus binding for those states that have not signed the Hague Convention of 1954 but are party to the Geneva Convention of 1949 and the two Additional Protocols. With the two

Additional Geneva Protocols, the central role of the Red Cross, respectively the International Committee of the Red Cross (ICRC), in the protection of cultural property during armed conflict is justified, which it still holds today, in cooperation with the International Committee of the Blue Shield.

Archaeology

Archaeological sites and archaeological objects are explicitly mentioned in Article 1 of the Convention as "cultural property" as defined by the Convention and thus every time implicitly referred to when the Convention speaks of "cultural property." The mentioning of archaeological sites as cultural property was not included in the preliminary drafts of the Convention text and was upon an Israeli proposal added to the list of immovable cultural property at the Hague Diplomatic Conference in May 1954, as the Israeli delegate noted "*that it was absurd to protect museums and allow their sources, which were the sources of history itself, to be exposed to the ravages of war*." The proposal was finally adopted by the Hague Conference by 30 votes to 1, with 5 abstentions. Accordingly, archaeological objects were explicitly included in the list of movable cultural property. In the following articles, archaeological property is no longer explicitly mentioned and the provisions of the Convention remain unspecific in this regard. This leaves the issue untouched of how the conduct of an archaeological excavation relates to the measures required in the Convention to protect cultural property in general and in regard to rescue excavation.

Archaeological excavation was subsequently also the subject of discussion on the protection of cultural property in occupied territory. Greece proposed the following addition to Article 5 of the Convention: "*The Occupying Power shall refrain from excavations or other action for the discovery of unknown cultural property save with the consent and participation of the competent national authorities of the occupied territory*." The proposal was only submitted orally at the closing stage of the last session of the Hague Conference and lost on the vote 9 votes to 8, with 22 abstentions. Thus, Article 5 of the Convention for the Protection of Cultural Property in Occupied Territory is phrased rather generally and does not refer to archaeological excavation at all.

The First Protocol does not explicitly mention archaeological sites, objects, or excavation.

The discussion on archaeological excavation in the occupied territory was, however, resumed at the 9th UNESCO General Assembly in December 1956 in New Delhi. The Conference finally passed the *Recommendation on International Principles Applicable to Archaeological Excavations*, whereby these principles had been pre-drafted by a Committee of Governmental Experts at an expert meeting in Palermo in May of that year. Article 32, the last but one, concretely refers to archaeological excavation in occupied territory: "*In the event of armed conflict, any Member State occupying the territory of another State should refrain from carrying out archaeological excavations in the occupied territory. In the event of chance finds being made, particularly during military works, the occupying Power should take all possible measures to protect these finds, which should be handed over, on the termination of hostilities, to the competent authorities of the territory previously occupied, together with all documentation relating thereto*." Nevertheless, this text does not imply the quality of a legally binding document in the sense of international humanitarian law (cf. the classification of official UNESCO texts – convention, recommendation, declaration). Therefore, experts, particularly the participants of the conference, requested that the principle expressed in Article 32 should be upgraded as an annex to the Hague Convention of 1954 aimed at an appropriate international legally binding character and a relevant revision of the Convention. A driving force behind the discussion was Jordan that expressed criticism of Israeli policy and suspected an attempt to twist historical facts behind the archaeological excavations in the – according to the then existing status based on the UN partition plan of 1947 – occupied territory of Palestine.

Consequently, specific considerations concerning archaeology in the discussions on the Second Protocol were primarily focused on the

issue of the protection of cultural property in occupied territory. Yet, the revised Lauswolt Document, as a result of the Lauswolt expert conference in 1997, did not contain any definite relation to archaeological excavation. But the draft text of the Second Protocol did state as a result of the Vienna expert conference of 1998 (in Article 3, paragraph 3, in the preliminary draft and) in Article 10, paragraph 1, in the final draft the sentence: "*Any form of theft, pillage or misappropriation of any archaeological excavation, any act of vandalism directed against any illicit purchase, or any other breach of integrity [or: authenticity] or any transformation of cultural property is prohibited*."

At the Hague Diplomatic Conference in March 1999, the issue of the protection of cultural property in occupied territory and therefore the issue of archaeological excavation in occupied territory were controversially discussed. The United States and others rejected the wording "*any archaeological excavation*" as being too comprehensive and proposed to exempt such excavation from the prohibition, which would be necessary for the preservation and protection of cultural property (in terms of rescue excavation). Israel viewed that the proposed wording by far exceeded the provisions of the original Convention. Lebanon suggested, as a compromise, to draft the provisions relating to theft and looting of archaeological sites and of archaeological excavation in two separate paragraphs, but insisted on the absolute prohibition of archaeological excavation in occupied territory. The UK rejected a total ban as being potentially counterproductive in practice. The working group "Chapter 2" under Austrian management eventually prepared the final wording of the prohibition: "*any archaeological excavation, save where this is strictly required to safeguard, record or preserve cultural property.*" This phrasing took into account all concerns as far as possible. On the one hand, it explicitly prohibits archaeological excavation in occupied territory in general as it had been repeatedly demanded since the 9th UNESCO General Assembly in 1956. On the other hand, it explicitly allows archaeological excavation if it is absolutely necessary for the purpose of conservation and protection of the archaeological property. The latter corresponds to the objections raised during the Hague Diplomatic Conference regarding a possible practical necessity of such excavation, e.g., in the course of the construction of buildings and roads, in occupied territory, as well as those concluding that an absolute prohibition of archaeological excavation in occupied territory was basically contradicting the Convention's requirement to protect cultural property in occupied territory.

Convention for the Safeguarding of Intangible Cultural Heritage (2003)

Janet Blake
Faculty of Law and the Centres of Excellence for Education for Sustainable Development and Silk Roads Studies, Shahid Beheshti University, Tehran, Iran

Introduction

UNESCO's Convention for the safeguarding of intangible cultural heritage was adopted in October 2003 at its 31st General Conference and entered into force on 20 April 2006. With the ratification of Malta on 13 April 2017, it now has 172 States Parties representative of all regions of the world. For some States, particularly in Africa, oral and traditional culture represents a major form of cultural heritage, and intangible heritage makes a significant contribution to the social and economic development of such societies and the well-being of their populations (Blake 2001). This was an important factor in giving the impetus to strengthen international safeguarding of this heritage and to give it more prominence. Moreover, the international community has recognized the importance of intangible cultural heritage as a basis for cultural diversity (an important value given recognition in UNESCO's Universal Declaration on Cultural Diversity of 2001) and the major role it can play in fostering truly sustainable development (UNESCO 2002).

Previous to the adoption of this Convention, the 1989 Recommendation on Safeguarding Traditional Culture and Folklore was the only international instrument addressing this question, although it had originally been proposed that intangible cultural heritage should be included as a subject matter of the 1972 Convention on the Protection of the World Cultural and Natural Heritage of UNESCO (Aikawa 2004). Two operational programs of UNESCO have also played an important part in normative development in this field: first, the Living Human Treasures program (1993) (UNESCO 1998) which was aimed at giving recognition to those individuals who are the living exponents of traditional culture and who ensure the transmission of their ICH to future generations by transmitting their skills, techniques, and knowledge. The second, entitled Masterpieces of the Oral and Intangible Heritage of Humanity (1998) (UNESCO 2006), had the aim of raising awareness of the importance of ICH among Member States and people at large through international proclamations of outstanding examples of such heritage.

In considering the model for a Convention on ICH, it was felt that one based broadly on the principles and mechanisms of the 1972 Convention would be the most appropriate, given the importance of raising awareness of this heritage and the great success of that older treaty (Bedjaoui 2004). However, it needed to be substantially adapted to the needs of intangible cultural heritage and the communities that create and maintain it (Kuruk 2004). In particular, it was important to give recognition to representative examples of ICH rather than "outstanding" ones (i.e., to avoid creating a hierarchy of items of ICH) and to avoid the "fossilization" of this living and evolving heritage that the use of a listing mechanism might risk (Kurin 2004). Another important consideration in developing this Convention was to make a clear separation from intellectual property approaches to protection (although very valuable in themselves) and for UNESCO to develop a purely cultural approach (Blake 2006).

Definition

The Convention in Brief

The Convention is divided into nine parts as follows. Part I (Articles 1–3) sets out the purposes of the Convention, definitions of key terms, and its relationship with other international instruments. Part II (Articles 4–10) is concerned with the organs of the Convention as described above, and Part III (Articles 11–15) is devoted to measures to be taken at national level to ensure the safeguarding of intangible cultural heritage, especially that which is not inscribed on either international List. Part IV (Articles 15–18) which deals with safeguarding ICH at the international level establishes two international Lists (the Representative List and the Urgent Safeguarding List) and a Register of Good Safeguarding Practices. Provisions relating to international cooperation and assistance are set out in Part V (Articles 19–24), and the establishment and operation of the Intangible Heritage Fund are placed in Part VI (Articles 25–28). Part VII (Articles 29–30) establishes a reporting system, and Part VIII (Article 31) comprises a transitional clause allowing for "Masterpieces" proclaimed under the 1998 program to be incorporated into the Representative List before the entry into force of the Convention. The final clauses are set out in Part IX (Articles 32–38).

The purposes of the Convention as set out in Article 1 are (a) to safeguard ICH; (b) to ensure respect for ICH; (c) to raise awareness at local, national, and international levels of the importance of ICH and thus to ensure a mutual appreciation of it; and (d) to provide for international cooperation and assistance. "Intangible cultural heritage" is defined in Article 2(1) as comprising "practices, representations, expressions, knowledge, skills – as well as the instruments, objects, artefacts and cultural spaces associated therewith" recognized by communities as their own, a source of identity and continuity for them, subject to intergenerational transmission and compatible with international human rights standards, mutual respect among communities sustainability. Paragraph 2 of this article then describes some of the main domains in which this heritage is manifested: (a) oral traditions and expressions, including language as a vehicle of the intangible cultural heritage; (b) performing arts; (c) social practices, rituals, and festive events; (d) knowledge and practices concerning nature and the universe; (e) traditional craftsmanship (van Zanten 2004). The term "safeguarding" is also defined in paragraph 3, and this understanding of safeguarding is a central motif that runs throughout the whole of the Convention text. It comprises "measures aimed at ensuring the viability of the intangible cultural heritage" that include the identification, documentation, research, preservation, protection, promotion, enhancement, transmission (particularly through formal and nonformal education) of it, as well as revitalization of various aspects of it.

In terms of institutional mechanisms, the 2003 UNESCO Convention establishes two main organs, namely, a General Assembly of the States Parties, that is, its sovereign body, and an Intergovernmental Committee for the Safeguarding of the Intangible Cultural Heritage (henceforth "ICH Committee") whose task is to oversee the implementation of the Convention, especially those provisions relating to the listing of ICH (selection criteria, amendments to the lists, etc.), international assistance, and the participation of non-state actors, especially cultural communities in implementing actions. The aforementioned Representative List of the Intangible Cultural Heritage of Humanity and the List of Intangible Cultural Heritage in Need of Urgent Safeguarding are established under Articles 16 and 17, on which ICH is inscribed according to criteria to set out in the Operational Directives for implementing the Convention (see below). These lists are designed, respectively, to raise awareness of the ICH (both internationally and locally) and to respond urgently in cases where ICH is in immediate danger of disappearance or serious distortion; for example, the requirement under Article 12 of the Convention that Parties draw up one or more inventories of ICH present in their territories, which is closely tied to the international listing system and represents a crucial aspect of national

safeguarding policies. The Convention also provides for a system of international assistance and cooperation to address the fact that the safeguarding of ICH is a matter of common concern to humanity and requires international solidarity to be achieved. In recognition of the fact that many of the States richest in ICH are also some of the world's least developed, an Intangible Heritage Fund is set up to support Parties in their safeguarding activities and the overall implementation of the Convention. In parallel with the establishment of these two international Lists, a general duty is placed on Parties to take the necessary measures for the national safeguarding of ICH present on their territories. This means that the international dimension of the Convention – the international Lists, assistance, and cooperation and the Fund – is to be fully complemented by safeguarding of all ICH whether listed or not at national level. A fundamental step in this is the identification and definition of such heritage which should be undertaken with participation of communities, groups, and relevant nongovernmental organizations. This should also be strengthened by the drawing up of one or more inventories of ICH; notably, the selection criteria for inscription on the two Lists require that any item of ICH proposed for inscription should already have been entered on a national inventory through a participatory process. Other national safeguarding measures should include promoting the function of ICH in society and taking account of it in planning programs; designating (or establishing) one or more competent bodies for safeguarding national ICH; encouraging study of the ICH and development of new research methodologies; adopting appropriate legal, technical, administrative, and financial measures that encourage training in ICH and its transmission; ensuring access to ICH while respecting customary practices governing this; and setting up institutions for the documentation of ICH. Education, awareness-raising, and capacity-building are also given prominence as national part of a national safeguarding strategy, with an emphasis on young people and the communities and groups related to this heritage, nonformal means of education, and building management and research capacities within communities. A notable provision is Article 15 that requires Parties to seek the widest possible participation of communities, groups, and (where appropriate) individuals "that create, maintain, and transmit" ICH in safeguarding activities and their active involvement in its management. This is an innovative approach for a cultural heritage instrument and poses important challenges to many States that operate a top-down, state-driven approach to cultural heritage management.

The implementation of the Convention's provisions is overseen by the Intangible Heritage Committee and governed by the Operational Directives adopted by the General Assembly of States Parties in 2008 (and subsequently revised in 2010, 2012, 2014, and 2016). The Directives cover such matters as criteria for inscription on the Urgent Safeguarding and Representative Lists; incorporation of items proclaimed "Masterpieces of the Oral and Intangible Heritage of Humanity" into the Representative List; criteria for selecting programs, projects, and activities that best reflect the principles and objectives of the Convention; the use of the ICH Fund established by the Convention; the purposes and forms of international assistance; participation of communities, groups, and, where applicable, individuals, as well as experts, centers of expertise, and research institutes in the operation of the Convention; and the role of nongovernmental organizations. The Directives are evolving in response to experience of implementing the Convention as well as new scientific knowledge, just as the Operational Guidelines to the 1972 World Heritage Convention have over the past 40 years. For example, new directives on raising awareness of ICH were adopted in 2010 that strengthen forms of community participation, and a new Chapter VI on sustainable development was added in 2016 that includes reference, inter alia, to gender equality. In 2012, the ICH Committee established the Evaluation Body on composed of six qualified governmental experts and six members of accredited nongovernmental organizations for the purpose of examining nominations for inscription on the Urgent Safeguarding List, proposals to the Register of Good Safeguarding Practices, and

requests for international assistance greater than US $100,000. This body, therefore, has a role similar to that of ICOMOS and IUCN for the World Heritage Committee of the 1972 Convention.

The List of ICH in Need of Urgent Safeguarding, which contained 47 items by 2016, comprises elements of intangible heritage that require urgent measures to keep them viable as judged by the States Parties and concerned communities, and, by inscribing an element on this List, international cooperation and assistance for stakeholders to undertake appropriate safeguarding measures can be mobilized. Examples of inscribed elements include a black pottery manufacturing process (Portugal); a popular ritual for maintaining the social and cosmic order (Brazil); traditional Lenj boatbuilding and sailing skills (Iran); wooden movable-type printing (China); the Mongol Tuuli epic (Mongolia); the Sanké mon collective fishing rite (Mali); and the Suiti cultural space (Latvia). The Representative List of the ICH of Humanity (RL) contains practices and expressions of ICH that demonstrate the diversity of this heritage and raise awareness about its importance. Unlike inscriptions on the World Heritage List, these items may be fairly mundane per se but are significant for their *representative* character. In 2008, the ICH Committee incorporated 90 items into the RL that had formerly been proclaimed as Masterpieces (under the terms of Article 31 of the Convention). By 2016, the number of elements inscribed on this List reached 365, with the addition of 33 in 2016 and including 2 re-inscriptions. This List is broad ranging and includes beer culture in Belgium, an annual carnival bell ringers' pageant (Croatia), irrigators' tribunals of the Mediterranean coast (Spain), the sociocultural space of the Candombe (Uruguay), an ethnic Korean farmers' dance (China), the art of falconry (a joint nomination from the UAE, Austria, Belgium, the Czech Republic, France, Germany, Hungary, Italy, Kazakhstan, Republic of Korea, Mongolia, Morocco, Pakistan, Qatar, Saudi Arabia, Spain, Syrian Arab Republic), the gastronomic meal (France), and a customary normative system (Colombia). The Register of Good Safeguarding Practices had 17 inscribed good practices by 2016, with 5 added in that year which included an ecomuseum (Croatia), a modern approach to traditional boatbuilding (Norway), a folklore festival (Bulgaria), regional craftsmanship centers (Austria), and a concept of safeguarding folk music (Hungary).

C

Key Issues

During the Convention's operation, certain key issues will continue to be confronted, and the response of the Parties (as expressed in the ICH Committee and the General Assembly) will have to be refined. Although it is relatively early still for much experience to have been gathered, we can identify certain aspects of its implementation that require further development. For example, the approach of this Convention toward the role of the wider community (especially those communities and groups that have a special relationship with a certain ICH) sets it apart from other cultural heritage Conventions. Although such a participatory approach may be found in Conventions dealing with sustainable environmental protection, for example, it is the first time that the central role of the community in safeguarding and managing cultural heritage has been explicitly recognized in a legal instrument. In a similar vein, the notion of "safeguarding" under this Convention is a comprehensive one that not only includes classic "protection" actions such as identification and inventorying of the ICH but also extends to providing the conditions within which it can continue to be created, maintained, and transmitted. This, in turn, implies the continued capability of the cultural communities themselves to do this – i.e., the community itself is the vital context for the existence of ICH and is placed at the center of this Convention rather than the heritage itself. In this way, the safeguarding of ICH is a more context-dependent approach that takes account of the wider human, social, and cultural contexts in which the enactment of ICH occurs.

Another significant conceptual departure from previous cultural heritage treaties, in particular, the 1972 Convention on which it was largely modeled,

has been the removal of any reference to the notion of "outstanding" or "exceptional" value as a definitional criterion. The intention behind this is to avoid any suggestion of creating a hierarchy of ICH and emphasizing that it is the significance of the ICH to its bearer community that is primarily being celebrated and safeguarded (Deacon and Beazley 2007). This involves a major paradigm shift in the approach both of national cultural heritage bodies and the international community. The implications of both of these developments are still to be fully understood.

The system for international cooperation and assistance for safeguarding ICH is another central feature of the Convention, and an important innovation here is the provision for joint requests for inscription by two or more States Parties in recognition of the fact that much ICH is transfrontier in character and will therefore often have more than one State Party with a territorial interest in its safeguarding. Again, this introduces new understanding of cultural heritage protection and management that accepts that cultural and geopolitical "frontiers" are frequently not coterminous and one that will have important effects on how States cooperate for the safeguarding of ICH. Moreover, the main purposes for which international assistance may be granted now include support for programs, projects, and activities for safeguarding ICH on national, subregional, and regional levels.

This Convention also raises important questions concerning the relationship between tangible and intangible cultural heritage and how to integrate safeguarding approaches to both these aspects of heritage. Earlier UNESCO cultural heritage treaties had been explicitly designed to protect and preserve the material (or "tangible") heritage, even if the associated intangible elements may also have been implicitly recognized. The effect of this is to create an artificial and arbitrary distinction between the "tangible" and "intangible" aspects of cultural heritage that is meaningless, for example, to many indigenous cultures since it fails to reflect their holistic view of heritage (Daes 1997 at para. 25). In many ways the result of an historical evolution in cultural heritage lawmaking has created an interesting "gray area" between the 1972 and 2003 Conventions where the same element may be subject to international protection and safeguarding under both treaties. A clear example of this is the Rice Terraces of the Philippine Cordilleras which were inscribed on the World Heritage List in 1995 as the first "organic evolving cultural landscape." In 2001, the Hudhud Chants of the Ifugao, songs of the women working on the Rice Terraces as part of the special ritual of rice planting, were recognized as Masterpieces of the Oral and Intangible Heritage of the World in 2001 (and subsequently incorporated into the Representative List of Intangible Heritage of the 2003 Convention). This overlap between the tangible and intangible aspects of heritage will require further consideration and the development of new approaches to implementation to resolve.

As noted above, the role that safeguarding intangible cultural heritage within the framework of the Convention can play in contributing to achieving more sustainable forms of development (in areas such as food security, health, conflict prevention and post-conflict resolution, and providing sustainable livelihoods) is a more recently addressed contextual issue of implementation that the Committee has addressed in its Directives. This new section also seeks to make States Parties more aware of the complex gender dimensions of ICH safeguarding and, in particular, the imperative to maintain gender equality as far as possible.

Given the relative youth of safeguarding measures for ICH in many countries, questions regarding such issues as establishing national ICH inventories (their scope, the criteria for inventorying, the ownership of inventoried items, etc.), ensuring community participation, capacity-building in both national bodies and communities, and dealing with secret and sacred heritage will increasingly be confronted. For this reason, it will be important for good practices from around the world to be gathered, shared, and evaluated so that the national safeguarding of ICH can reach the same level of expertise as that for the material cultural heritage. To take this further, it can also be said that improving the safeguarding of ICH will also address gaps in protecting "tangible" cultural heritage since they have such a close and intimate relationship with each other.

Convention on the Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property (1970)

Patrick J. O'Keefe
School of Law, University of Queensland, Brisbane, QLD, Australia

Introduction

The Convention on the Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property (1970) is an attempt to control the movement of cultural property from one State to another where this is against the laws of one or both. The property may be stolen from its owner or the movement itself may be prohibited such as when an object is smuggled from one state into another. As of 30 March 2018, there were 136 States Parties to the Convention.

Definition

Cultural property for the purposes of the Convention is defined in Article 1. To qualify, the property must be "specifically designated by each State as being of importance for archaeology, prehistory, history, literature, art or science." In addition, it must belong to 1 of 11 categories of objects set out in the Article. These include the products

of archaeological excavations (including regular or clandestine) and antiquities more than 100 years old.

The meaning of "specifically designated" has been contested over the years. However, it is now widely accepted that each State has the right to decide what objects are important for its own cultural heritage. There is wide variation in how States do this. Some have a list of individually named items that are prohibited from export. Others have what is called a control list – there is a description of general categories, for example, archaeological objects, which is then broken down by criteria based on significance, age, and representation in local collections. Only that material is subject to export control.

Key Issues

The Convention can only be directly utilized by States. Individuals have no right to take any action under this instrument. For example, an archaeologist who knows objects are being clandestinely excavated and smuggled out of the country cannot directly rely on this Convention to do anything about it. He or she would have to go to the authorities and make a complaint. It is then up to those authorities to take what action they consider desirable in accordance with local law, the Convention and, particularly, political considerations. They may conclude that other factors outweigh any benefits to be taken by pursuing the smugglers.

Like other UNESCO Conventions, the 1970 Convention was drafted at a diplomatic conference attended by representatives of States interested in the issue. During these conferences, compromises are often made among the delegates. In 1970, the conference was presented with a draft convention prepared by a "special negotiating committee" established by UNESCO. The United States of America, having taken no part in the negotiation of this document, produced its own draft. In order to encourage the United States' participation, two articles from its draft were incorporated in the UNESCO draft. These now appear as Articles 7 and 9 of the Convention.

The view has been taken by the United States and some other countries that these articles are the heart of the Convention. Article 7 deals with offers to museums of illegally exported cultural property and theft from museums and other public institutions. Article 9 provides for concerted international efforts, including the control of exports and imports, when "cultural patrimony is in jeopardy from pillage of archaeological or ethnological material." Concentration on these two articles gives the Convention a very narrow application.

Those who want a broader interpretation rely on Article 3: "The import, export or transfer of ownership of cultural property effected contrary to the provisions adopted under this Convention by the States Parties thereto, shall be illicit." They regard Article 3 as the overall governing provision of the Convention and Articles 7 and 9 as specific applications (O'Keefe 2017).

While these interpretations indeed represent different philosophies regarding the trade in cultural property, the issue is exacerbated by different approaches to legal drafting. The United States draft was prepared by Common Law lawyers who are accustomed to working with very precise and defined legal documents. The UNESCO draft came from the Civil Law tradition where legislation is expressed in terms of general principle which is then applied to specific situations by officials or the courts. These different approaches can be seen in Articles 3, 7, and 9.

When States become party to a Convention, they are required to comply with any obligations it imposes. But how this is done depends very much on the State concerned. For example, under its Constitution, the Convention may automatically become part of the local law when the State ratifies, and its meaning would then have to be interpreted by the national courts. In other States, if the Convention affects the rights of citizens, legislation must be passed to implement it.

These different views of the Convention influence how States use it to control imports of cultural property that is alleged to have been illegally exported. For example, Australia takes a broad view. It considers as an illegal import all cultural property that another State regards as illegally

exported under a law concerning cultural property. It does not matter when the object was illegally exported provided it was imported into Australia after the date the Australian implementing legislation came into force, that is, 1 July 1987. Nor does Australia require the other State to be party to the Convention. Forfeiture of such cultural property is not automatic. There must first be a request from the government of the country concerned to the Australian government for its return.

The United States does not implement the provisions of this Convention on foreign export controls directly but only through further bilateral agreements with individual States to restrict imports of defined archaeological and ethnological material. The foreign State has to prove to a Cultural Property Advisory Committee that there is an emergency condition regarding the defined material. If the argument is accepted, and an agreement is entered into, any such material entering the United States is subject to seizure and forfeiture carried out under normal Customs procedures. As of 30 March 2018, there were 17 such agreements or Memoranda of Understanding as the United States calls them. Countries involved include China, Cyprus, Greece, and Italy (full details of this system are available at https://eca.state.gov/cultural-heritage-center/cultural-property-protection/bilateral-agreements). The other State party to the bilateral agreement may also accept obligations. For example, Italy agreed to continue its efforts to:

- Ensure the prompt prosecution of looters
- Stop the illicit use of metal detectors in archaeological areas
- Enhance training for the Carabinieri Special Unit for the Protection of Artistic Patrimony
- Create and pursue innovative and effective ways to detect and stop the looting of archaeological sites

Switzerland has followed the United States in demanding bilateral agreements for implementation of the foreign export controls. As of 30 March 2018, it had such agreements with China, Columbia, Cyprus, Egypt, Greece, Mexico, and Peru (http://www.bak.admin.ch/kulturerbe/04371/04377/index.html?lang=en).

While limited, the method of enforcement adopted by the United States and Switzerland is much more effective than that of Japan which took a very narrow interpretation of the Convention and narrowed it further by administrative arrangements that can apply only in a few instances. Objects from clandestine excavations and unlawful exports from foreign countries into Japan are not covered. Only cultural property stolen from a museum or other institution under Article 7(b)(i) of the Convention after 9 December 2002 and which is on an inventory supplied to the Japanese Government can be considered for return if found in Japan (Kono and Kani 2003).

Some States that are listed as party to the Convention have had their status questioned in other States. For example, France is listed as having ratified the Convention, but in an English case – *Iran v. Berend* [2007] EWHC 132 – the judge took the view that the Convention was not "yet part of the law of France." France had assumed that its existing law was sufficient to implement the Convention. Either the English judge was wrong as to the effect of French law or France needs to effectively implement it.

This complicated situation may cause despair in the hearts of some. However, if they are seeking the return of an object, it is the law of the State where the object is located that must be considered, preferably by an expert legal advisor. If the law of that country incorporates the 1970 Convention, then there is a greater chance of being successful.

Even if that State is not a party to the Convention, the latter can still have influence. Its courts may be prepared to consider the Convention as representing public policy that they should follow. There was a well-known case in Germany in 1972 – *Allgemeine Versicherungsgesellschaft v. E.K.* (BGHZ 59 at 83) – where the court found that the Convention represented emerging international public policy. A German company had insured a consignment of African masks and statues sent by a Nigerian company from Port Harcourt in Nigeria to Hamburg. Six bronze statues disappeared and the Nigerian company

sought to recover their value under the insurance contract. The statues had been exported contrary to Nigerian law. The court held that, even though Germany was not a party to the Convention, the contract was unenforceable in Germany as it was against public policy including emerging international public policy.

The Convention has also heavily influenced codes of ethics adopted by museums and other public bodies. For example, the International Council of Museums (ICOM) has a Code of Ethics (http://icom.museum/who-we-are/the-vision/code-of-ethics.html) which lists the Convention as "international legislation that is taken as a standard in interpreting" the Code. It further states that museum policy should acknowledge this. Thus, the Convention, through the Code, applies not only to member museums but also to the conduct of individual members of the museum profession as they need to be "conversant with relevant international, national and local legislation"(Paragraph 8.1) and they "should not support the illicit traffic or market in natural and cultural property, directly or indirectly" (Paragraph 8.5).

Independently of the ICOM Code, many collecting institutions have used the date the UNESCO General Conference adopted the Convention, that is, 1970, as a watershed in their collecting policies. For example, the British Museum states that objects "acquired for the Collection should have a documented legal history; which, where applicable, should extend back before November 14th 1970" (https://www.britishmuseum.org/pdf/Acquisitions%20policy%20July%202013%20FINAL.pdf). The J. Paul Getty Museum has decided that the object should be outside its country of modern discovery since 1970 or legally exported from its country of modern discovery since 1970 (http://www.getty.edu/about/governance/pdfs/acquisitions_policy.pdf). Many other museums have adopted the same approach which illustrates the significance of the 1970 Convention outside its purely legal role.

There are other provisions of the Convention that attempt to control illicit traffic in cultural property. For example, dealers play a major part in the transmission of such property. The Convention does have a provision intended to regulate dealing in cultural property. Article 10 requires dealers to have a register recording the origin of each item, the name and address of the person they acquired it from, and the price and description of each item sold. This should allow objects to be traced more easily. However, the Convention stated that registration would be "as appropriate for each country." Once again, there are major variations in how States implement this provision. Some have very detailed rules which are enforced by regular visits from the police. Others have relied on the information they collect in connection with value added tax. For example, the United Kingdom maintains that what dealers have to report for this purpose gives up the same information as Article 10 requires. However, being in a different context means that the information is not as obvious or as readily available as it would be if collected in the context of enforcing the Convention.

Since its inception, UNESCO has been concerned with protection of cultural property in time of armed conflict. It has a Convention with two Protocols concerned with this. One significant aspect of such protection is the control of movement of cultural property during the conflict. The Protocol to the Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict 1954 is entirely devoted to this issue, and Article 9 of the Second Protocol 1999 is also relevant. Article 11 of the 1970 Convention should also be applied although it seems to have been largely ignored. There are significant questions concerning its implementation. For example, the Article refers only to export and transfer of ownership. If either of these is done "under compulsion," arising from the occupation of a country, the transaction is to be regarded as "illicit." What this means is not clear. Perhaps the transaction should be regarded as void and ineffective as contrary to public policy. At the very least, it should not be allowed to stand, and the position prior to the occupation should be reinstated.

Future Directions

The 1970 Convention now has 136 States Parties, but the geographical distribution of these States is very uneven. There are few States Party from the Pacific area, and in Africa, significant States such as Kenya, Malawi, Mozambique, Namibia, and Uganda are not party. In Europe, the past decade has seen that major art market countries such as Belgium, Denmark, Germany, the Netherlands, and the United Kingdom become party but not yet States such as Ireland and Malta. UNESCO is seeking to increase the number of States Parties through targeted national information campaigns directed to parliamentarians and other people at the political level to explain "how far action developed internationally can help reinforce the legal and operational framework of States for the protection of their cultural heritage" (UNESCO Doc. 184/EX 20). UNESCO has decided that the 1970 Convention would be given priority for monitoring.

Some consider the Convention to be outdated after 48 years. They argue that it should be replaced by one more attuned to current conditions, for example, that there should be a greater emphasis on penal aspects of the fight against illicit traffic. But any attempt to change the Convention is fraught with difficulties. First, there would be a problem in obtaining agreement among States on the content of such a Convention. We have seen the different ways in which States implemented the present Convention. Reaching agreement on a new text would be a long and controversial undertaking. The second point is related to this. Negotiating a convention that affects the rights of States and their citizens is a lengthy and costly project. For example, the UNESCO Convention on the Protection of the Underwater Cultural Heritage 2001 took 10 years from the time the Member States of UNESCO were presented with a draft text by the International Law Association and involved four major negotiating meetings in Paris as well as numerous subsidiary ones. These meetings are costly to run both for the States sending delegates and for UNESCO, which has to provide the facilities including simultaneous interpretation in a number of languages. Finally, if a new Convention were to be adopted, would it require States becoming party to denounce the 1970 Convention? If so, there would be a period when some States were party to the new Convention and some to the old. For a long time, protection would be diminished till the former gained sufficient adherents to make it workable. If States were not required to denounce the 1970 Convention, there would be a situation where some States were party to the new Convention, some to the 1970 Convention, and some to both.

Convention on the Protection of the Underwater Cultural Heritage (2001)

Sarah Dromgoole
School of Law, University of Nottingham, Nottingham, UK

The Convention on the Protection of the Underwater Cultural Heritage was adopted by the United Nations Educational, Scientific, and Cultural Organization (UNESCO) in 2001. It entered into force internationally on 2 January 2009, 3 months after the date of deposit of the twentieth instrument of ratification. As at 29 August 2017, the Convention had been ratified by 57 States. The genesis of the Convention was in 1988, and it was therefore the product of 13 years of drafting work and negotiations.

The Convention is an international treaty which is designed to create a comprehensive and uniform legal framework to regulate human interference with underwater cultural heritage (UCH) in order to ensure that such heritage is preserved for the benefit of humanity. For the most part, its provisions are aimed at regulating activities which are "directed at" UCH, in other words activities conducted with an intention to physically disturb UCH. Therefore, while the Convention is primarily aimed at controlling the activities of treasure hunters and souvenir seekers, its regulations apply with equal force to activities of archaeologists as well. The Convention is not designed to prohibit deliberate interference but instead to ensure that any such interference is regulated in accordance with internationally accepted archaeological standards. Those standards are enshrined in the Rules set out in an Annex to the Convention, and they form an integral part of the Convention. The Rules are based on the Charter on the Protection and Management of Underwater Cultural Heritage 1996, a set of guidelines produced by the International Council for Monuments and Sites (ICOMOS).

UCH is defined by the Convention to mean "all traces of human existence having a cultural, historical or archaeological character which have been partially or totally underwater, periodically or continuously, for at least 100 years" (Art. 1(1)(a)). A non-exhaustive list of examples of such "traces" provided by the Convention makes it clear that the definition extends to three categories of remains: (i) sites, structures, buildings, artifacts, and human remains, together with their archaeological and natural context; (ii) vessels, aircraft, other vehicles or any part thereof, their cargo, or other contents, together with their archaeological and natural context; and (iii) objects of prehistoric character. Controversially, there is no significance criterion. Instead the key limiting factor is that the material must have been underwater for at least 100 years. This means that material remains of the twentieth century are gradually falling within the scope of the Convention, and, significantly, all the remains of World War I located in maritime areas around the world will soon be covered. The reason that a time limit of this sort is necessary in the context of material found in the sea is that there needs to be some way of distinguishing between material that is subject to ordinary commercial laws, including the law of salvage, and that which falls within the preserve of heritage law. The Convention follows the approach of some national underwater heritage legislation in adopting 100 years as the point of division.

At the heart of the Convention lie a number of core principles and objectives. Preservation in situ must be considered as the first option in determining a management plan for any site, and interference will be permitted only where justified for scientific or protective purposes. In circumstances where recovery of UCH is permitted, the recovered material must be deposited, conserved, and managed in a manner that ensures its long-term preservation. Among other things, UCH must not be commercially exploited and, subject to two limited provisos, this means that it must not be "traded, sold, bought or bartered as commercial goods" (Annex, Rule 2). While the law of salvage is not explicitly excluded from applying to UCH falling within the scope of the Convention, the circumstances in which it can apply are so restricted that its application is very unlikely in practice. Responsible nonintrusive access to observe or document in situ UCH is encouraged except where incompatible with its protection and management. The cornerstone of the Convention is the broad general principle that

States Parties must cooperate in the protection of UCH. This principle underlies many of its protective mechanisms and is one of the Convention's most valuable features.

Although some provision is made for all maritime waters, including the territorial sea, the focus of attention of the drafters was on creating a viable regulatory framework for UCH lying in international waters, in other words beyond the 12-mile territorial limit. The need for such a framework has arisen over the last 30 years, during which time there has been a revolution in marine technology. As a result, humans aided by submersible vehicles now have direct physical access to 98% of the ocean floor (O'Hara 2000). Although operations on the deep seabed (at depths of thousands of meters) are likely to remain relatively few and far between, the continental shelf is now highly accessible, and UCH in this sometimes extensive geological area is under growing threat. The threat comes not only from well-funded commercial treasure salvage companies equipped with the latest technologies but also from individual divers using specialized mixed gases which permit access to waters well in excess of 100 m. Prior to the introduction of the Convention, the only international laws providing specific protection for UCH were two short articles of the 1982 UN Convention on the Law of the Sea, and, significantly, these articles provide no specific means of controlling activities directed at UCH on the continental shelf. The provision the 2001 Convention makes for this maritime zone is therefore a crucial component of its regime.

While the majority of the Convention's provisions are aimed at creating a regulatory framework for activities "directed at" UCH, some useful provision is also included for activities "incidentally affecting" UCH. By this is meant activities which may inadvertently, rather than deliberately, disturb or damage UCH. Activities such as trawling by fishermen, dredging for marine aggregates, pipeline- and cable-laying, and construction of wind farms and oil and gas rigs all clearly fall into this category. Among other things, each State Party is required to use the best practicable means at its disposal to prevent or mitigate any adverse effects that might arise from such activities. Furthermore, there is provision for the reporting of UCH finds by such operators working on the continental shelf and on the deep seabed.

The meat of the Convention is made up of technical legal provisions facilitating the control of activities affecting UCH, as well as the standard-setting principles and Rules in respect of such activities. However, the Convention also includes many other useful provisions that supplement the regulatory regime. Of particular note is the framework it establishes for cooperation, information-sharing, and mutual assistance by States Parties. The Convention clearly envisages that the States that participate in its regime will develop broad-ranging collaborative efforts on a whole host of matters including investigation, excavation, documentation, conservation, study and preservation of UCH (Art. 19), and training (Art. 21). In the longer term, the benefits that could be derived from such collaboration could be very significant.

UNESCO's intention was to create an international legal framework for UCH that would be capable of achieving global acceptance. Throughout the negotiation process, considerable efforts were made to try to ensure that the final text would be adopted by consensus. Unfortunately, this aim was not fulfilled. Although the general principles and objectives of the Convention, including the Rules in the Annex, do appear to have achieved universal support, a small but significant minority of the negotiating States were unable to fully support the final text. Among these were a handful of major maritime States, all of which had the same, or similar, objections. This group included the United States, the Russian Federation, the Netherlands, France, Germany, Norway, and the United Kingdom. Since these are the States whose nationals and flag vessels have the capability to undertake deepwater search and recovery work, it is vital to the overall success of the Convention that they participate in its regulatory regime. The nature of the regulatory mechanisms is such that unless and until they participate, the Convention cannot be fully effective.

There were two main areas of difficulty for these States. The first was that they regarded some of the technical provisions of the Convention, particularly its articles with respect to the continental shelf, as being incompatible with the 1982

Convention on the Law of the Sea. These States (and, it should be said, many others) regard the 1982 treaty as having a preeminent status along the lines of a "Constitution for the Oceans." As such, they believe that subsequent treaties dealing with maritime activities should not interfere with the framework it sets out. The second area of difficulty related to the treatment the 2001 Convention affords to sunken warships and other State vessels and aircraft, which form a major component of UCH. The maritime States insist that such vessels and aircraft, even when they have been lying on the seabed for many years or even centuries, are subject to sovereign immunity and can only be interfered with under the express authority of the flag State. While the Convention takes this position into account, some of its technical provisions (which envisage States Parties cooperating in the management of sites) can be interpreted as prejudicial to the immunity principle.

Despite these and other areas of concern for some States, the Convention has now garnered a very respectable number of ratifications, and State practice under the Convention is starting to develop. In several parts of the world, including the Caribbean and the Mediterranean and Adriatic Seas, the Convention's cooperation mechanisms should soon be effective in countering treasure-hunting activities and ensuring activities directed at UCH are conducted appropriately. Interestingly, a number of the maritime States that abstained from voting in favor of the Convention at the time of its adoption have revised their view. In 2013, having concluded that the benefits the Convention provided in respect of regulating treasure hunting on its continental shelf outweighed its original objections, France deposited its instrument of ratification to become a State Party. The Netherlands has formally expressed its intention to ratify in the future, and there are indications that Germany may have revised its position too. For the foreseeable future, it seems likely that other significant States, including the United States, the Russian Federation, Norway, the United Kingdom, Greece, Turkey, and Venezuela, will remain outside the regime. Nonetheless, there is no doubt that even for these States, the general principles of the Convention and the Rules set out in its Annex will be highly influential and standard-setting.

Copley, Vincent

Eleanor Jenkins
Parkville, VIC, Australia

Basic Biographical Information

Vincent (Vince) Copley is an elder of the Ngadjuri people of South Australia. He has made important contributions to the reclamation and protection of Australian Indigenous cultural heritage, especially by revitalizing the fragmented cultural identity of the Ngadjuri people. He is also an important figure in Australian sporting history.

Copley was born in 1936 in Point Pearce, South Australia. At a young age, he moved to live at St Francis' Anglican Home in Adelaide, where he came into contact with Charlie Perkins, John Moriarty, Gordon Briscoe, and others who

went on to become important campaigners for Indigenous rights.

Copley was an eager sportsman and won several sporting awards including the Port Adelaide Football Club's Best and Fairest in 1954. He went on to coach the Curramulka Football Club for over a decade during the 1950s and worked for the Aboriginal and Torres Strait Islander Commission as sports officer from 1982 to 1993. Copley was also a keen cricketer, and the Vince Copley Medal now recognizes the "most outstanding cricketer" at the annual Lord Taverner's Statewide Indigenous Carnival. Copley was appointed cochair to the National Indigenous Cricket Advisory Council in 2000, in tandem with Dr. John Bannon, ex-premier of South Australia. In this role, Copley organized various national and international programs for Indigenous cricketers including the 1988 tour of England, which commemorated the first ever Australian tour of 1868.

While Copley's sporting successes helped him to find recognition in Australian society, his influence extends beyond the sports field and into political affairs. Throughout the 1970s, Copley directed the first Aboriginal community center in Adelaide, significant for offering Indigenous health and education services outside of state services. He was also involved in the establishment of South Australian legal aid for Indigenous people and worked as Executive Officer and later Regional Manager for Aboriginal Hostels Ltd. until the 1980s. Copley played a key role in organizing the 2012 reunion of the "St Francis boys" and their families.

Major Accomplishments

Vincent Copley's major accomplishments in the field of archaeology have been reconstructing, protecting, and promoting Ngadjuri identity and heritage. Much of Ngadjuri cultural knowledge was lost during the nineteenth and twentieth centuries as a result of land dispossession and the relocation of Ngadjuri people to the Point Pearce Mission.

In the late 1990s, Copley led Ngadjuri people in a concerted plan to repossess Ngadjuri cultural knowledge. After several years as chair of the Ngadjuri Walpa Juri Land and Heritage Association Inc., Copley became chair of Ngadjuri Elders Heritage and Land Care Council. As leader of the Ngadjuri Heritage Project, Copley was instrumental in bringing descendants of the Ngadjuri "back to country" and helping them to reclaim a sense of their Indigenous identity by rediscovering important sites on their traditional lands. This project developed the Ngadjuri nation's capacity to manage cultural heritage places on Ngadjuri lands and served as a model for other Indigenous groups.

Copley has placed an emphasis on close and ongoing cooperation between Indigenous and non-Indigenous partners, working with archaeologists and students to research rediscovered sites significant to the Ngadjuri. This has resulted in the establishment of a research partnership between the Ngadjuri people and Flinders University, fostering the documentation of rock art and archival research projects investigating early Ngadjuri anthropological work. Copley's efforts have encouraged greater cooperation between Indigenous and non-Indigenous landowners in matters of land use. After being approached by the Regional Council of Goyder, Copley initiated the excavation, study, and reburial of human skeletal remains at Red Banks Conservation Park.

Copley has stressed the importance of recognizing mixed Indigenous heritage; while much of his work has focused on the Ngadjuri, he also has family links to the Narangga, Ngarrindjeri, and Kaurna people and has worked towards Native Title claims with the Narangga and Kaurna groups.

Copley has encouraged cooperation between Indigenous peoples internationally, organizing a delegation of Aboriginal storytellers, artists, and dancers between 1974 and 1977 for the Festival of African Culture in Nigeria. From 1993 to 1995, he worked independently as a consultant in cultural awareness for schools and colleges. He was also involved in the organization of the 2006 Indigenous Cultural Heritage Symposium held in Burra, South Australia, which saw Indigenous contributors from all over the world.

Copley's grandfather Barney Warria was a friend and important source for the anthropologist Ronald Berndt. Upon Berndt's death in 1990, an embargo was placed on his field notes for a period of 30 years. Copley debated the legality of this embargo on the grounds that it deprived Ngadjuri

people of an important source of knowledge about their cultural heritage. Copley demonstrated that this information was intellectual property shared between Warria and Berndt. Copley's challenge successfully lifted the embargo, making Berndt's field notes available to a number of Indigenous groups whose histories and knowledge had been recorded in them.

Corning Museum of Glass

Jane Shadel Spillman
The Corning Museum of Glass, Corning, NY, USA

Basic Information

The Corning Museum of Glass, located in Corning, New York, opened on May 19, 1951. It was founded by Corning Glass Works (now Corning Incorporated) to celebrate the 100th anniversary of the Houghton family's involvement with glassmaking. Amory Houghton had helped to start the Union Glass Works in Somerville, Massachusetts, in 1851, and he purchased the Brooklyn Flint Glass Works in Brooklyn, New York, in 1864. Four years later, he moved that firm's equipment and employees to "the foot of Walnut Street" in Corning, where Corning Incorporated continues to have its headquarters today.

Major Impact

The museum was initially part of the Corning Glass Center, which also housed the Steuben Glass factory and shop, a municipal auditorium, a recreation area for Corning Glass Works employees, and a gallery demonstrating the science of glass. Chartered by the Board of Regents of the University of the State of New York, the museum is a not-for-profit educational institution. From a modest beginning, with nearly 2,000 glass objects from around the world, the museum has assembled a collection that now has more than 47,000 objects spanning 3,500 years of glassmaking history. The mission of the museum – to tell the world about glass and its history – has not changed, however.

The museum's Rakow Research Library is the library of record for the art and history of glass, and it seeks to acquire every publication in every format in this field. It also houses a collection of rare books and incunabula, as well as several hundred prints that illustrate glass factories, glassmaking, glass advertisements, and the use of glass from the seventeenth to twenty-first centuries.

During its 60-year history, the museum has presented more than 90 exhibitions. Some of these shows have been drawn exclusively from its own collection, but others have included substantial numbers of loans from other museums and private collections in the United States and abroad. Illustrated catalogs have been published to document more than two dozen of these exhibitions. Seven collection catalogs have also been issued, as well as more than two dozen books on other glass-related subjects. Since 1959, the museum has published the *Journal of Glass Studies*, which contains articles of new research in glass history from antiquity to the early twentieth century. It also produces *New Glass Review*, another annual publication, which focuses on contemporary glass.

On June 23, 1972, flooding caused by Tropical Storm Agnes left five feet of water in the museum's galleries and library. It was the worst natural disaster to strike an American museum up to that time. The museum reopened on August 1, even though much of the collection was still covered with mud. A new museum building, designed by Gunnar Birkerts, opened in June 1980, with all of the collection housed above the 1972 flood level. The Birkerts building is attached to the original Harrison and Abramovitz Glass Center building. Between 1998 and 2001, the Glass Center collections became part of the museum, which substantially expanded again. The Studio, which opened in 1996, offers instruction in glassmaking to students at all levels of expertise throughout the year. In addition to daily demonstrations of glass-blowing and flame working at the museum, the museum sponsors the Hot Glass Show which involves demonstrations in a variety of locations including celebrity cruise ships.

The museum has welcomed about 28 million visitors in its 60 years of operation.

Cornwall, Ian Wolfram

Terry O'Connor
PALAEO, Department of Archaeology,
University of York, York, UK

Basic Biographical Information

Ian Cornwall (1909–1994) was an important figure in the early development of what became environmental archaeology and in particular in the study of animal bones from archaeological deposits. Although his background was in the arts, Cornwall was strongly influenced by the pioneering geochronologist Frederick Zeuner (1905–1963), and he became reader in Human Environment at the Institute of Archaeology, University of London, by the time of his retirement in 1974.

Major Accomplishments

Cornwall's reputation rests on a series of textbooks that he produced in the 1950s and 1960s. *Bones for the Archaeologist* (1956; revised 2nd ed. 1974) aimed to put a working knowledge of skeletal anatomy within the reach of archaeologists and Quaternary scientists. The book's structure resembles Flowers' classic text *Osteology of the Mammalia* (1885) and is notable for its anatomical precision, verging on pedantry. The style, however, is highly accessible and *Bones for the Archaeologist* became one of the first successful enterprises in archaeological science. Cornwall followed this in 1958 with *Soils for the Archaeologist*, which attempted to do the same for soils and sediments. Although described at the time as "a pioneer undertaking," *Soils* did not have quite the impact of *Bones*, possibly because of its less intrinsically fascinating subject matter.

Bones and *Soils* established Cornwall's reputation as a communicator of archaeological science. His subsequent books built on that initial success by offering more synthetic views of the human past. *The Making of Man* (1960) was a radical undertaking for its day: an informative and quite detailed account of the fossil evidence for human evolution written for children. *The Making of Man* was awarded the Carnegie Medal for 1960, putting Cornwall in the company of C.S. Lewis, Walter de la Mare, and Rosemary Sutcliff. It also marked Cornwall's first collaboration with the illustrator Marjorie Maitland Howard. Her lively illustrations graced Cornwall's *The World of Ancient Man* (1964) and *Prehistoric Animals and Their Hunters* (1968). The latter book includes a chapter "Ecology, Biotopes and Faunal Communities" that was exceptionally integrative for its day and still reads well.

Cornwall returned to a more geomorphological topic in 1970 with *Ice Ages: Their Nature and Effects*. One other Cornwall volume of note is the novel *Hunter's Half-Moon* (1967), set in a fully realized and, for its day, highly credible upper Paleolithic world. Mrs. Maitland Howard provided mammoths for the dust jacket. Taken in sum, Cornwall's books reflect his wish to understand past human lives in their full environmental context and to communicate that knowledge to a wide audience. His intellectual reach was broader than that of many academics today, and his published output was not constrained by the pressures of modern academia.

Apart from the sole-authored books, Cornwall appears in the literature mainly as a coauthor or contributor to many and diverse archaeological publications. He contributed studies of bones or sediments to a wide range of major excavations, including the 1957–1960 campaigns at Knossos, Pre-Pottery Neolithic human burials at Jericho, and Ramm's investigations into Roman York. An early contribution to *Proceedings of the Prehistoric Society* in 1953 discussed sedimentation events at Bronze Age sites in southern England, prefiguring John Evans' influential account of the same topic in *PPS* in 1990. Cornwall was a member of the Experimental Earthwork Committee that set up the Overton Down experiment, and coauthored (with Paul Ashbee) the first report of that experiment in *Antiquity* (1961). He also experimented with thin-section studies of Neolithic pottery, working with Henry Hodges, and was an early advocate of soil micromorphology in archaeology. Later in his career, Cornwall developed a strong interest in human settlement in Mexico, the subject of his 1970 Henry Stopes lecture to the Geologists' Association.

Aside from his published work, Ian Cornwall was an inspiring and memorable teacher. He looked like an academic, his slight build supporting a shapeless corduroy jacket from which protruded a well-used pipe, not necessarily fully extinguished. Precise but good-humored, he engaged well with students, albeit more so with men than with women, encouraging the enthusiastic ones and gently coaxing the others. Cornwall had a remarkable knack for making archaeological science memorable, whether that was rolling up a sleeve to demonstrate the workings of skeletal articulations on his own boney frame or using a metal teaspoon and cigarette lighter to demonstrate loss on ignition with a pinch of sediment. His contributions to archaeology were those of an amiable and broad-minded bridge between "digging" archaeology and the rapidly developing specialisms of archaeological science and of an exceptionally gifted communicator who could inform and enthuse academic and lay audiences alike.

Corsican Late Prehistory

Kewin Peche-Quilichini
Archéologie des Sociétés Méditerranéennes UMR 5140, University of. Paul-Valéry, Montpellier, France

Introduction

This is the first English-language discussion of Corsican prehistory. Research about Corsican prehistory began late in comparison to the enthusiasm that inspired the early days of French

archaeology. Indeed, it was necessary to wait until the nineteenth century for some pioneers of the discipline to address the problems posed by this insular territory. In addition, the two worlds considerably delayed the progress of knowledge on the subject. It was not until the mid-1950s that a real investigative program was launched, with numerous and varied results that were frequently renewed up until the present day.

Definition

The island of Corsica, located in the heart of the western basin of the Mediterranean, has been populated by people since at least the Mesolithic (Fig. 1). The earliest traces of human presence date to the tenth millennium BC. Recent excavations have revealed the existence of a hunter-gatherer-collector open-air camp on the site of Caniscione (Monacia-d'Aullène, Corse-du-Sud), which today is coastal but previously was several kilometers from the sea. The current state of knowledge suggests that this first colonization of the island collapsed around 6500 BC, 5000 years after the time when the marine regression separated the Corsican-Sardinian block into two islands to form Corsica to the north and Sardinia to the south. Consequently, it seems that the island has been totally depopulated for a few centuries.

Key Issues and Current Debates

Many of the key issues in the prehistory of Corsica are concerned with its colonization, occupation, and the relationships between people living on Corsica with other peoples in the Mediterreanean. While the possibility of brief occupations by fishermen from the continental coasts was accepted in the past, today it is accepted that there were more permanent occupations, as demonstrated by the mountain camp of Curacchiaghju (Levie, Corse-du-Sud). At the same time, three sepulchral assemblages are known, making the island a particularly favorable territory for the study of tombs of that time. These are always burials in natural cavities: a group of people at Campu Stefanu (Sollacaro, Corse-du-Sud; seven to eight individuals), and an individual at Torre d'Aquila (Pietracorbara, Haute-Corse), and at Araguina-Sennola (Bonifacio, Corse-du-Sud; grave of the famous "Lady of Bonifacio"). Throughout this period, the lithic industry is characterized by a tooling that was very different from continental standards, one in which microlithic tools are almost absent.

At around 5800 BC, Corsica was subject to new human exploration (Fig. 2), by groups bearing the *impressa* ceramics, whose economy is of the early Neolithic type. It is interesting to note that this industry is represented across the entire island, including the mountain areas of the inner zone (shelter Albertini; Albertacce, Haute-Corse). The process of neolithisation continued quite classically to around 5700 BC. Following this, the cardial industries were introduced (Bailloud 1969), characterized by pottery decorated with shells and the recurrence of certain lithic tools, such as cross-cutting arrowheads, mostly in Sardinian flint. The cultural expression of the middle of the sixth millennium BC illustrates shared traditions between Corsican, Sardinian, and Tuscan populations (Pienza-Basì-Filiestru type pottery). At this time, agriculture seems to have emerged, but hunting and gathering were still omnipresent. Partial sedentarization is highlighted by the appearance of habitats composed of several houses built of perishable materials, for example at Rinaiu (Sartène, Corse-du-Sud) (D'Anna et al. 2001) or at A Petra (L'Ile-Rousse, Haute-Corse) or in caves (Araguina-Sennola, Campu Stefanu, Filitosa (Sollacaro, Corse-du-Sud), Basì (Serra-di-Ferro), Corse-du-Sud), Strette (Barbaggio, Haute-Corse), shelter Albertini). Interments were carried out in the natural cavities (Araguina-Sennola, Torre d'Aquila). In the south of the island, the end of the Early Neolithic period (around 5200/5000 BC) evolved according to microregional precepts to give rise to the Curasian style (of the Curacchiaghju cave).

The middle phase of the Neolithic period is marked by a sedentary settlement which is materialized by the development of important villages such Monte Revincu (Santo-Pietro-di-Tenda, Haute-Corse) (Leandri 2013) in the north and

Corsican Late Prehistory, Fig. 1 Map of main Mesolithic and Neolithic Corsican settlements/burials (KPQ)

Presa (Altagène, Corse-du-Sud) in the south. The houses are of rectangular plan with permanent bases made up of large stone slabs. It is assumed that the rise of this type of architecture favored the remarkable integration of the megalithic architectures on the island. In fact, near the habitats, the first coffers with a tumular structure, illustrated by the monuments of Monte Revincu or Vascolacciu (Figari, Corse-du-Sud), designed to welcome the deceased of the

Corsican Late Prehistory, Fig. 2 Map of main Bronze/Iron Ages Corsican settlements/burials (KPQ)

community and very similar to contemporary Sardinian monuments (Li Muri, Macciunitta). At the same time, alignments of small menhirs appeared (Rinaiu) around the graves. The industries are of the presian type with fine dishes that have little decoration and a lithic instrumentum essentially based on the exploitation of local quartz. Pastoralism would have grown significantly during this phase (de Lanfranchi and Weiss 1997).

During the Late Neolithic, from 4000 BC, domestic and funeral architecture remain little known. The main site is Basì (Bailloud 1969), in the southwest of the island, whose industries have become eponymous: the Basian type industry. It is characterized by a fine dish and lithic tools favoring the obsidian imported from the Monte Arci massif in Sardinia. The links with Sardinia are materialized in ceramics with fairly obvious similarities with the Ozieri style. In the calcareous regions of the south, the Sardinian component becomes predominant (site of Montlaur; Bonifacio, Corse-du-Sud). Basian was mostly recognized in the south of the island. In the north, the material culture is quite similar (Monte Grossu; Biguglia, Corse-du-Sud) but probably partly autonomous.

About 3200 BC the Terrinian style was established (Camps 1988a, b). This was present on all parts of the island but with microregional and chronological variants. This trend is characterized by the emergence of large and perched habitats close to the mouths of major rivers: Monte Lazzu (Casaglione, Corse-du-Sud), Mortetu (Sarrola-Carcopino, Corse-du-Sud), I Calanchi (Sollacaro, Corse-du-Sud), Buffua (Figari, Corse-du-Sud), and of course the eponymous Terrina (Aleria, Haute-Corse). Nearly nothing is known about contemporary burials, except at the end of the period in which the deceased are placed in natural cavities (I Calanchi). The industry is characterized by a certain cultural retreat on the island territory. Sardinian influences slowed considerably, as did imports of obsidian and flint. The lithic tooling favored local resources, essentially rhyolite, and serial productions appeared, in particular piercing-type arrowheads armatures. The dishes were quite stereotyped, in forms as well as decoration. The appearance of copper metallurgy at the beginning of the period is a notable innovation, which started in Corsica from 2200 BC. The Campaniform current, perhaps via Sardinia, infiltrated slightly some southern contexts at I Calanchi and Monti Barbatu (Olmeto, Corse-du-Sud) but without impacting the material systems as it did at that time in Sardinia and in the south of France.

During the Early Bronze Age (2000–1650 BC), Sardinia continued to opening up. This seems to have put an end to the Terrinian cultural references. At the beginning of the second millennium BC, the habitat takes on smaller dimensions and adopts positions naturally fortified (Cesari 1992). Starting from 1700 BC, these defensive sites have fortifications, and their summit houses a tower, like at Castellucciu-Calzola (Pila-Canale, Corse-du-Sud), I Calanchi, Alo-Bisughjè (Bilia, Corse-du-Sud), or Tappa (Porto-Vecchio, Corse-du-Sud). These, called *torra* (Grosjean 1966; Virili and Grosjean 1979), are similar to a monument that appears at the same time in Sardinia, the corridor-type *nuraghe*, illustrating deep connections between the two islands. These *torre* are likely to have been used for the storage of community reserves (Peche-Quilichini 2011). At that same time, there are some examples of occupations in the plain, probably dedicated to agricultural production (Campu Stefanu), or near the ponds (Pinia; Ghisonaccia, Haute-Corse) in order to develop the exploitation of lagoon resources. Several burials are known for this period. Dolmens (Settivà; Petreto-Bicchisano, Corse-du-Sud) and coffers (Pallaghju; Sartène, Corse-du-Sud) are reused or built for the occasion and accommodate burials. The natural cavities, however, remain privileged spaces like for the shelters of Murteddu (Sartène, Corse-du-Sud), Minza-Castellucciu (Sartène, Corse-du-Sud), and Capu Retu (Carbuccia, Corse-du-Sud). A possible case of secondary incineration and deposit of ashes in an urn is known at Folelli (Penta-di-Casinca, Haute-Corse), in the north of the island. In the south, the first great alignments of menhirs appeared at that time like I Stantari (Sartène, Corse-du-Sud), Rinaiu, Pallaghju, and Vaccil'Vecchju (Grossa, Corse-du-Sud), while isolated menhirs structure the territory. The furniture shows a specialization in terms of contexts. The funerary ensembles integrate dishes and specialized objects, of Campaniform tradition or, more often, of Sardinian affinity (Bonnànaro phase). In the settlements, the dishes show Sardinian or North-Italic affinities but also local initiatives (Tappa-Tiresa-Mugliunaccia typical industries). The same applies to the production of bronze tools, whose references are rather Alpine and North Italian.

In the Middle Bronze Age (1650–1200 BC), perched and defensive habitats developed, and the south of the island was covered with *torre* and fortifications like Filitosa, Contorba (Olmeto, Corse-du-Sud), Cucuruzzu (Levie, Corse-du-Sud), Araghju (San-Gavino-di-Carbini, Corse-du-Sud), or Monti Barbatu, which hosted some houses behind their dry stone enclosures. These dwellings have quite varied plans, adapted to the morphology of the land and the walls. The occupation around the ponds continued and strengthened in certain regions, notably on the eastern coasts and notably at Sant'Agata (Aleria, Haute-Corse) and Mar'e Stagnu (Aleria, Haute-Corse). Any associated burials have not yet been recognized. Only one case of the reuse of a coffer (Cuntrasarda; Sartène, Corse-du-Sud) and a burial under shelter (Campu Stefanu) is known and only for the end of the phase. The latter falls, in particular, with a set of beads ornaments in amber (originating in Baltic but with a Mycenaean typology) and glass (Mesopotamian but with Egyptian typology), which illustrate the peripheral position of Corsica in Mediterranean exchange networks around the thirteenth century BC. This aspect of distance relations is illustrated at the same time by several other cases of glass beads and by the presence of an ox-hide copper ingot in the north of the island, at Sant'Anastasia (Borgo, Haute-Corse). Middle Bronze Age dishes show the importance of Italian models in local production; Grotta Nuova, Viverone, proto-Apenninic, and Apenninic types are fairly well represented, especially at the beginning of the period, although typically local forms are not absent. At the same time, the rare metallic objects seem to bear witness to a form of continuity with the Early Bronze Age, since the references are to be found around the Alpine arc.

The Late Bronze Age (1200–850 BC) marked a rather sharp break with the end of the Middle Bronze Age. This phase is currently only well known in the south of the island. The habitat is characterized by a rather frequent occupation of the fortified sites of the Middle Bronze Age, marked by restructuring, as it's evident at Alo-Bisughjè, Cucuruzzu, Ceccia (Porto-Vecchio, Corse-du-Sud), and Castidetta-Pozzone (Sartène, Corse-du-Sud). New, much smaller fortresses were also built toward the end of the second millennium BC: Saracinu (Quenza, Corse-du-Sud), Casteddu di Sarradu (Altagène, Corse-du-Sud), Cruccanu (Sartène, Corse-du-Sud), or Cuciurpula (Sorbollano, Corse-du-Sud). At the foot of these defensive acropoles, big villages made up of elliptic dwellings like Cuciurpula, Puzzonu (Quenza, Corse-du-Sud), and Tusiu (Altagène, Corse-du-Sud) were already forming, a precursor to the pre-urban norms of the Early Iron Age (Peche-Quilichini et al. 2015). The tombs perpetuated the tradition of the use of shelters (Punta di Casteddu; Sartène, Corse-du-Sud), perhaps by substituting the practice of burial with that of incineration, in some cases. The only known site in the north of the island dates from the twelfth century BC. The Grotta Laninca (Lano, Haute-Corse) is a suspended limestone cavity which has been the site of several burials with the particularity of combining coffins carved from yew. The style and form of ceramic dishes were totally renewed at that time and showed a double influence of Protovillanovian Tuscany and of Northern Sardinia to constitute the Apazzu-Castidetta-Cucuruzzu style. It should be noted that some forms indicate the use of a particular technical knowledge and the existence of specialized workshops. The metallurgical production is also very dynamic, with tools inspired by the Nuragic area and weapons rather italic. One of the most important features of the Late Bronze Age is the appearance of statues menhirs (D'Anna et al. 2007), anthropomorphic monoliths that are sometimes grouped in alignments (I Stantari, Filitosa). These monumental works present warrior attributes (Fig. 3), especially in the south: helmets, cuirasses, and offensive weapons (swords and daggers). It is assumed that the sites of settlement constitute sanctuaries and/or structuring points of the territory.

The Early Iron Age (850–550 BC) is characterized by a regionalization of sociocultural characteristics. From one valley to another, forms of habitat and furniture present significant differences. In the south, villages like Cuciurpula, Cumpulaghja (Sainte-Lucie-de-Tallano, Corse-du-Sud), Saparaccia (Levie, Corse-du-Sud), Nuciaresa (Levie, Corse-du-Sud), and Cozza

Corsican Late Prehistory, Fig. 3 Statue-menhir Santa Naria (Olmeto, Corse-du-Sud): with 4 m long, it's the highest on the island

Torta (Porto-Vecchio, Corse-du-Sud) are made up of elliptical-shaped houses clustered on the edge of the plateau, often in continuity with the settlements of the Late Bronze Age (Peche-Quilichini et al. 2015). In the center of the place of life, there is often a large circular building whose function remains undetermined. The fortifications of the Bronze Age are almost all abandoned at the beginning of the first millennium BC. The ceramic dishes (Nuciaresa style) are in keeping with the tradition of the previous epoch, even if they stand out quickly and lead to new shapes and to a profusion of decors. The period is characterized in particular by the appearance of horned zoomorphic vases in particular contexts (foundation deposits and burials). The tombs are in most cases burials in caves and include some metal objects that illustrate cultural connections with Sardinia (l'Ordinacciu cave; Solaro, Haute-Corse) as well as local dynamics. At the end of the period, the coastal settlements (Cozza Torta) show relations with the Greek colonies of the Western Mediterranean. In the north, the situation is less clear. Some relatively perched habitats are known in a mountainous context, housing dwellings with irregular planes behind networks of earthworks, as we can observe at E Mizane (Calacuccia, Haute-Corse) and partially at Tuani (Corté, Haute-Corse). The dishes (Tuani-Mizane style) are totally different from those of the south. The metal furniture, especially represented in the burials, reveal contact with Villanovan Etruria, especially in the shape of the fibula as the ones of Cagnano cave (Cagnano, Haute-Corse) or Teppa di Lucciana shelter (Vallecalle, Haute-Corse). The tombs are most often burials under shelter, but some coffers with tumulus that have hosted cremations are also documented (Mamucci; Santo-Pietro-di-Tenda, Haute-Corse).

The foundation of Alalia (Aleria, Haute-Corse) by the Phocaeans at about 565 BC marks the Late Iron Age (550–100 BC) (Jehasse and Jehasse 1973). The settlers, expelled by the Etruscans 25 years later, had a negligible influence on the majority of the island. The beginning of this period is not well known. It is from the third century BC that the data are available. At that time, the communities were regrouping again in fortified settlements: Cima a i Mori (Palasca, Haute-Corse), Capu Mirabù (Monticello, Haute-Corse), Punta Pulveraghja (Galeria/Calenzana, Haute-Corse), and Punta Ficcaghjola (Alata, Corse-du-Sud). It is likely that this situation was due to the influence of the extension of the conflict of the First Punic War, in which the indigenous groups are placed at the heart of the geostrategic stakes between Rome and Carthage. After the victory of the Latins, the indigenous populations of Corsica gradually became integrated into the Roman cultural world and imported typical goods of the republican era. On the northeastern coast, small towns (I Palazzi; Venzolasca, Haute-Corse) emerge and develop,

notably thanks to the growth of these commercial networks. Some tombs are known for this phase: Pinzu a Verghine (Barretali, Haute-Corse), Monte Lazzu, San Simeone (Ajaccio, Corse-du-Sud), and Santa Catalina (Levie, Corse-du-Sud). Once again, these burials were under shelter, with very poor furniture. The indigenous industries of the Late Iron Age are mainly characterized by dishes, degreased with asbestos (in the north), and decorated with combs, as well as by some types of fibula and daggers and by production in series of white glass beads ("porcelain rings"). These artifacts will sometimes be exported to Liguria, Tuscany, Calabria, and Sardinia.

About 99 BC, the foundation of the city of Mariana (Lucciana, Haute-Corse) by the veterans of General Marius marked the entry of Corsica into history. This was in spite of several centuries of sociocultural dithering, sprinkled with several indigenous revolts, which involved some delay in the processes of romanization.

In the end, Corsican prehistory (Fig. 4) reveals a typically Mediterranean evolutionary structure. After a Mesolithic whose perenniality is uncertain, the phase of neolithisation is perfectly synchronous with the processes observed in Tyrrhenian context, including for internal and difficult to access zones. In the Middle Neolithic period, the rise of megalithic manifestations took place contemporaneously with the primitive developments of this phenomenon in the Mediterranean and Atlantic domains. From an economic point of view, the assertion of sedentariness, agriculture, and pastoralism during this phase underlines the integration of the island with the major concepts of this pivotal period. With the massive importation of Sardinian obsidian in the fourth millennium BC, but especially with the assimilation of techniques of fusion and shaping of copper around 3300 BC, Corsica enters an era of technological differentiation for which it is showing no delay, despite its sharp deficit in primary resources, especially in comparison with its neighbor, Sardinia. Adaptation and its corollary, organization, seem to dictate the precepts of the economic, and therefore social, structure of the island groups of the Late Neolithic. It is, moreover, perhaps this path that generated, in the Chalcolithic period, a phenomenon of withdrawal and cultural closure. The Terrinian was a fundamentally Corsican style, from its origins to its progressive dissolution under the impact of Campaniform and/or Sardinian cultural infiltrations.

It was necessary to wait for the beginnings of the Bronze Age to see the island open, massively, to Sardinia in the south and to the Italo-Alpine world to the northeast. These influences were evident in the architectural and material culture of local populations and are quite likely to be associated with an influx of populations. As elsewhere in the Mediterranean, the Bronze Age saw the development of long-distance networks, as well as the power of those who were able to control them. The end of the Middle Bronze Age (or Late Bronze Age) is a paroxysm, with the local assimilation of cultural codes from the Aegean through countless intermediaries, a phenomenon in which Nuragic Sardinia probably played a leading role. As elsewhere, the Late Bronze Age, with the climatic changes that accompanied it, marked a quite clear break with the Middle Bronze Age. The social organization then seems in full redefinition, under the aegis of local chiefdoms immortalized in the megalithic art, even if this art is deeply anchored in its neolithic substratum. The Early Iron Age, continuing in certain aspects, remained a period of transformation, especially marked by development of an open habitat. This marked the end of an era of two millennia of defensive installations, full of significance about

Corsican Late Prehistory, Fig. 4 Chronology of material cultures and periodization of Corsican prehistory (by KPQ)

the social instability that could prevail from one valley to another. At the end of this period, Corsica entered into the era of the colonies, Greek, then Etruscan, even Carthaginian, without their impact being really important to island societies. It was only with the great conflicts of the third century BC that there was radical change, which led gradually to the assimilation of local groups into the great historical ensembles of antiquity.

Future Directions

The study of Corsican prehistory can be fruitfully extended in a number of directions. People on the island of Corsica had interactions with people from many different parts of the Mediterranean, and it is clear that these influences and interactions changed through time. A closer comparison of material evidence could allow these relationships to be studied in greater detail and provide a more nuanced understanding of the past of this island and of the region. The changing nature of relationships between Corsica and Sardinia, in particular, is of great interest. Furthermore, as the first discussion of Corsican prehistory published in the English-language, this paper brings new data to English-language analyses of prehistory in the Mediterranean. It is hoped that the data presented in this paper will be used to enrich English-language interpretations of regional prehistories.

Key contacts: Prof. Marilyn Palmer MBE, Chair; Dr. Ken Smith MBE, Director

Major Impact

The Council for British Archaeology (CBA) is a UK-wide organization which works to promote "archaeology for all." It was originally established in 1944 by a consortium of county archaeological societies which were concerned at the archaeological implications of the redevelopment that would be needed at the end of the Second World War.

Since 1944, the CBA's work has expanded and increased in scale, with funding provided initially from the UK Government via the British Academy. In recent years the CBA has become more self-sufficient but has been successful in raising funding from various trusts and foundations, as well as via grants from the national heritage agencies across the UK, particularly Historic England, and other sources.

Initially, the CBA's membership consisted of a range of institutions at national, county/district, and local levels. In 1993, the membership offer was extended to individuals, and the CBA also took over the Young Archaeologists' Club (YAC) for young people under 17. The CBA's membership now includes some 7500 members and subscribers, together with c 450 institutional members. The membership offers links with membership of a UK-wide network of similar charitable organizations at national and regional scale, including Archaeology Scotland, CBA Wales/Cymru, and 11 English CBA Regional Groups.

In recent years, the CBA's activities have been structured into four areas: participation, discovery, advocacy, and, more recently, sustainability. The CBA has been a strong advocate for public participation in UK archaeology, originally via its *Calendar of Excavations* and most recently via support for "community archaeology." The CBA not only works to encourage others to involve the public in archaeology but has also run its own activities, such as the Home Front Legacy 1914–1918 project looking at the physical legacy of the First World War across the UK. Large numbers of volunteers are also involved in delivering hands-on archaeology to young people through YAC branches across the UK (http://www.yac-uk.org).

The CBA's advocacy work relates to all forms of archaeological evidence, including historic buildings, archaeological sites and landscapes, and portable antiquities. The CBA is one of the National Amenity Societies which is notified about the proposed demolitions to listed buildings in England and Wales and works with a network of volunteers to make informed responses. The CBA also works with partners through The Archaeology Forum (http://archforum.archaeologyuk.org/), The Heritage Alliance (http://www.theheritagealliance.org.uk), and Wildlife and Countryside Link (http://www.wcl.org.uk) to provide a strong voice for archaeology across the UK, as well as supporting the All Party Parliamentary Archaeology Group at Westminster (http://www.appag.org.uk). Some of the key issues in which the CBA has been involved as an advocate in recent years include heritage protection legislation, definitions of treasure and illicit trade in antiquities, heritage crime, the impact of climate change on the historic environment, the value of local authority-based archaeology services and their Historic Environment Records, and the protection and presentation of World Heritage Sites, such as Stonehenge.

The CBA is an active and innovative publisher with over 200 monographs either in print or available electronically free of charge via the Archaeology Data Service (http://archaeologydataservice.ac.uk). Its regular magazine, *British Archaeology*, brings the latest news and thinking on archaeology to CBA members. An electronic open-access journal, *Internet Archaeology* (http://intarch.ac.uk), has been published since 1995, allowing online multimedia content to be made widely available. The CBA supports research, participation, and training through a range of online services. The CBA is a charity registered in England and Wales and also registered independently as a charity in Scotland. The charity is overseen by an elected group of 15 trustees on behalf of CBA members. The CBA's UK headquarters and most of the CBA's staff are located in York.

Council of Europe Framework Convention on the Value of Cultural Heritage for Society (2005)

Henry Cleere
Institute of Archaeology, University College London, London, UK

Introduction

The Council of Europe Framework Convention on the Value of Cultural Heritage for Society (Council of Europe 2005a), known as the Faro Convention after the city in which it was signed, was opened for signature on 27 October 2005. Following ratification by ten member states, it came into force on 1 June 2011. At the time of writing (June 2011), it has been ratified by 11 of the Member States of the Council of Europe (Bosnia and Herzegovina, Croatia, Georgia, Latvia, Luxembourg, Moldova, Montenegro, Norway, Portugal, Serbia, and Slovenia).

This is a Framework Convention, which sets out principles and broad areas for action which have been agreed by States Party. None of its provisions can convey rights to individuals solely through national ratification without legislative action by individual States.

Key Issues/Current Debates/Future Directions/Examples

Aims and Origins of the Convention

The Convention arose from the desire of the Committee of Ministers to provide a framework of reference for heritage policies in the context of rights and responsibilities in this area and the positive benefits to be drawn from the use of the heritage as cultural capital, with a view to underpinning existing CoE instruments concerning more specific aspects of cultural heritage. These were judged not to affirm the growing importance of the cultural heritage relative to sustainable development, globalization, and awareness of the cultural identity dimension in conflicts. The possibility of drawing up an additional protocol to existing conventions was explored but was rejected as unsatisfactory, and so in 2003, a select committee of experts responsible to the Steering Committee for the Cultural Heritage (CDPAT) was appointed in order to draw up a draft framework convention. Among its aims were:

- Reaching agreement on an enlarged and cross-disciplinary approach to the cultural heritage and the concept of a common European heritage
- Establishing the principle of fair treatment for heritages that represent the various cultural traditions that coexist in Europe

- Committing States to introducing heritage policies and educational initiatives to promote dialogue and mutual understanding, with a view to preventing conflicts
- Establishing a pan-European context for the cooperative preparation of criteria for sustainable development in the use of knowledge and skills as a development resource
- Committing States to the use of management approaches based on participation by all players in society

The Convention was drafted at a series of meetings in 2003 and 2004, which took account of suggestions made by other related committees, and it was adopted by the Ministers' Deputies on 13 October 2005.

The Text of the Convention

The Faro Convention consists of a preamble followed by 20 articles, divided into five sections, as follows:

- Section I Aims, definitions, and principles
  - Article 1 Aims of the Convention
  - Article 2 Definitions
  - Article 3 The common heritage of Europe
  - Article 4 Rights and responsibilities relating to cultural heritage
  - Article 5 Cultural heritage law and policies
  - Article 6 Effects of the Convention
- Section II Contribution of cultural heritage to society and human development
  - Article 7 Cultural heritage and dialogue
  - Article 8 Environment, heritage, and quality of life
  - Article 9 Sustainable use of the cultural heritage
  - Article 10 Cultural heritage and economic activity
- Section III Shared responsibility for cultural heritage and public participation
  - Article 11 The organization of public responsibilities for cultural heritage
  - Article 12 Access to cultural heritage and democratic participation
  - Article 13 Cultural heritage and knowledge
  - Article 14 Cultural heritage and the information society
- Section IV Monitoring and cooperation
  - Article 15 Undertakings of the Parties
  - Article 16 Monitoring mechanism
  - Article 17 Cooperation in follow-up activities
- Section V Final clauses
  - Article 18 Signature and entry into force
  - Article 19 Accession
  - Article 20 Territorial application

Explanatory Report

Simultaneously with the approval of the Convention in 2005, the Council of Europe issued an Explanatory Report (Council of Europe 2005b). This document puts professional flesh on the legislative bones of the Convention proper, and is essential reading for planners, administrators, and others concerned with the protection of those elements of the European cultural heritage located within the frontiers of their own countries.

It begins by commenting that the approach adopted in the Convention is consistent with the specificity of the Council of Europe while at the same time being innovative. For example, in accordance with the concept of the "common heritage of Europe," constituted essentially through shared experience and commitment to human rights and democratic principles, the Convention deals with heritage as an object of individual rights which give it meaning. This avoids the uncertainty of changing definitions of heritages, by referring to their foundation in human rights and liberties (Article 4 exactly follows the logic of interpretation of the European Convention on Human Rights). In the present Convention, heritage is treated both as "source" (Preamble, paragraph 1) and as "resource" for the exercise of freedoms (Preamble, paragraph 3 and Article 2).

The text also addresses the right to cultural heritage (Article 4), which it expresses as a dimension of the right to participate in the cultural life of the community (Article 1) and the right to education (Preamble, paragraph 4, citing Article 27 of the Universal Declaration of Human Rights, and Articles 13 and 15 of the International Covenant on Economic, Social and Cultural Rights). In this way, all reference to cultures and to heritages as concrete entities is avoided.

The text develops the idea of a "common heritage of Europe" (Article 3) in which the cultural heritage shared by Europeans interacts with the

agreed democratic, political, and social ideals of Europe to generate the idea of a common European responsibility toward cultural heritage. This corresponds with the distinctive character of the European heritage that has resulted from its depth and rich historical stratification, its diversity of regions, and its shared cultural phenomena, the products of the interaction of diverse cultures over the centuries.

Thus defined, the European cultural heritage is a primary resource for democratic engagement in support of cultural diversity and sustainable development; it is also a source of prosperity and unity for the diverse communities present in Europe. Europe's cultural heritage is treated in this Convention as the "cultural capital" from which, through the investment of human ingenuity and effort, have originated the rich and varied cultures of modern Europe. Conservation of this cultural capital is essential, both for its intrinsic value and for its potential as an investment from which future development (cultural, social, and economic) may be generated.

The Faro Convention is consistent with new trends which underline the growing importance of cultural values in the environment, territorial identity, the character of landscape, and the environmental dimensions of cultural heritage. This specificity clearly distinguishes the Convention from earlier international instruments of the Council of Europe and from those launched by UNESCO. It provides the basis for the concept of a "cultural environment."

The idea of the common heritage of Europe allows an approach to the notion of "heritage communities," for there can be no cultural life without a community (Article 27 of the Universal Declaration of Human Rights). A heritage community is defined here as a variable geometry (Article 2b), avoiding reference to ethnicity or other rigid communities. "Heritage communities" here are therefore a very different concept from "the heritage community," the term sometimes used to encompass all professionals engaged in heritage-related activities. This Convention concentrates upon the benefits of developing cooperation between the diverse heritage communities that occur within Europe.

This is an area which, more than any other, requires international and transnational cooperation to bring together the community of peoples represented in the Council of Europe. Consequently, the Convention is distinct from the work of UNESCO, in respect of:

- *Cultural diversity*: The field has been expanded by the Universal Declaration of UNESCO on Cultural Diversity (2001). The present Convention, while recognizing the important synergy between cultural heritage and cultural diversity, concentrates primarily upon how the cultural heritage can be used sustainably to create economic and social conditions favorable to the survival of diverse communities. The maintenance of cultural diversity in the face of globalization is the objective of international effort.
- *Tangible elements of the heritage*: UNESCO's work on a global scale continues to operate using a sectoral approach, establishing lists of major assets regarded as world heritage, whereas the present Convention deals with cultural heritages as ensembles.
- *Intangible aspects of cultural heritage*: Here is where the present Convention focuses primarily on ascribed values rather than on the material or immaterial elements which combine to constitute heritages, thus taking an approach which is distinct from UNESCO's Convention for the Safeguarding of the Intangible Cultural Heritage (2003).

This is a Convention which, without excluding the exceptional, particularly embraces the commonplace heritage of all people.

Crannog Investigations in Scotland

Anne Crone and Graeme Cavers
AOC Archaeology Group, Edinburgh, Scotland, UK

The primary type of wetland settlement found in Scotland are *crannogs*; these are artificial islands, made or significantly modified by human agency, which, with the exception of one example in Wales, are found only in Scotland or Ireland. The majority of dated examples were built in the first millennium BC, but they continued to be built and used episodically until the early modern period. They generally take the form of a foundation of organic materials and stone carrying a platform of timber logs or planks raised above water level (Fig. 1). The island may be connected to the shore by a timber causeway. On top of the timber platform, buildings were erected made of timber and, in later periods, of stone. Recent excavations at Black Loch of Myrton in SW Scotland have now revealed another type, a settlement built on a natural island of peat in a shallow loch (Crone and Cavers 2016). This is unlikely to be a unique site; re-examination of antiquarian literature suggests that there was a similar settlement at nearby Dowalton Loch (Stuart 1866, 120–121, Plate XII) and it is possible that some crannog islands began as wetland settlements similar to Black Loch. The great archaeological asset of these wetland settlements is that organic materials such as structural timbers, wooden artifacts, textiles, and food debris are preserved in cold anaerobic conditions.

Most known crannogs survive as islands surrounded by water, but some are completely submerged and others are now drying out in drained agricultural land. **Site formation** is critical to understanding and interpreting crannogs (see SWAP 2007 for discussion) but is not easy to resolve without large-scale intervention. Although most excavated examples appear to have been constructed by dumping material into the loch to form a mound (known as a *Packwerk* construction), a pile-dwelling construction has been proposed for other sites. This clearly has implications for the interpretation of materials found in the core of the mound; do they represent occupation debris which has built up under the pile dwelling or do they represent relict material used in the construction of the mound which predates the occupation of the crannog? Soil micromorphological studies, such as those carried out on some Swiss lake villages (Wallace 2000) and Lithuanian lake dwellings (Menotti et al. 2005), might resolve these issues, but coring through stony mounds has not yet proved possible.

Scottish lochs are particularly cold and murky, and extensive **underwater excavations** have only been carried out in the larger (clearer) Highland lochs, at Oakbank crannog in Loch Tay (e.g., Dixon 2004) and Ederline crannog in Loch Awe (Cavers and Henderson 2005). At both sites, a basket of techniques adapted from shipwreck excavation and the investigation of continental lake villages was employed, with removal of silt carried out using a Venturi system water dredge (see Dean et al. 1992). Although Scottish lochs present a challenging environment in which to excavate, crannogs are generally located in water less than 6 m deep, allowing divers to work for long periods of time using surface-supplied air (Fig. 2).

Buiston, in Ayrshire (Crone 2000), is an example of an excavated "dryland site," which had been drained in the nineteenth century and now lay within a boggy but accessible field. Coring demonstrated that, despite the drainage, significant organic deposits survived (Fig. 3). The site was initially treated as a *box excavation* with small trenches separated by balks. Water management soon became a crucial issue, and a deep trench was subsequently cut across the site which served as a sump from which the water could be pumped. The trench had another advantage in that the substructure could be fully investigated, and it provided greater stratigraphic control; dark organic deposits are much more clearly seen in section than in plan. This became a major issue at Black Loch of Myrton where stratified floor surfaces of highly compacted plant litter could not be easily distinguished from earlier or later floors because the deposits oxidized

Crannog Investigations in Scotland, Fig. 1 Crannog in Loch Nell, Argyll. The majority of crannogs survive as vegetation-covered mounds projecting just above the water

Crannog Investigations in Scotland, Fig. 2 Underwater excavations at Ederline crannog, Loch Awe. Divers excavating below water are supported by a safety supervisor based on a scaffolding platform above the site

almost immediately upon exposure (Fig. 4). This issue has been tackled by intensive monolith sampling of the deposits in section and subsequent soil micromorphological analysis which has helped to reveal the repeated refurbishment of the floor surfaces (Crone et al. 2019; Robertson and Roy 2019).

Unsurprisingly, water levels have been a problem at every wetland site excavated to date. At Cults Loch and Whitefield Loch, both in SW Scotland, this severely restricted the areas that could be excavated in plan. The Cults Loch crannog is now a promontory extending out into the loch (Cavers and Crone 2018), while Dorman's Island, in Whitefield Loch, survives as a tree-covered island which had to be reached by boat (Cavers et al. 2011). In both cases narrow, "sacrificial" trenches were dug around the edges of each

Crannog Investigations in Scotland, Fig. 3 Excavation underway on the seventh century AD "dryland" crannog at Buiston, Ayrshire. The stone hearth and wooden flooring of a round house lie to the left of the photograph while on the right, the palisaded walkway, which formed the defensive perimeter of the crannog, curves around

Crannog Investigations in Scotland, Fig. 4 One of the roundhouses at Black Loch of Myrton. In the thick black deposit overlying the hurdle subfloor of the structure consists of multiple layers of compacted plant litter laid down as flooring and not visible to the naked eye

trench to act as sumps and keep the central area of the trench relatively dry. At Black Loch of Myrton, trenches were sometimes up to 2 m below the water table, and deep sumps had to be dug, with pumps running almost continuously, but once drained the trenches were very workable, while open-sided event shelters protected the surfaces from rain.

Placing crannogs in their contemporary physical and social landscapes is now recognized as key to their understanding and is central to the research agenda of the Scottish Wetland

Archaeology Programme (SWAP 2007). The crannogs in Whitefield Loch and Cults Loch were selected for investigation following a systematic review of the evidence and subsequent field assessment, which identified the rich later prehistoric landscape within which they both sit (Cavers et al. 2011; Cavers and Crone 2018). Reconstruction of the contemporary landscapes, including excavation of neighboring cropmark sites, formed part of the program.

Cremation in Archaeological Contexts

Jacqueline I. McKinley
Wessex Archaeology, Salisbury, UK

Introduction

The earliest recorded use of ceremonial burning in the disposal of the dead comes from Australia and dates to c. 24000 BCE (Lange et al. 1987: 17). Cremation appears to become a major mortuary ritual from around c. 8000 BCE (Davies and Mates 2005: 455–573) and its use has varied temporally and geographically. In the British Isles, for example, cremation formed the predominant rite within the periods c. 2400–1100 BCE, CE 43–150 and 410–650. A similar temporal pattern existed in much of Europe but with regional variations, including a persistence of the rite in the northern provinces of the Roman Empire (third to fifth centuries CE) and Late Iron Age/Norse Scandinavia (eighth to eleventh centuries CE). Following the adoption of the middle-eastern practice of inhumation by the Romans, particularly after Emperor Constantine embraced Christianity (CE 313), cremation became a minority rite in Europe and other areas where that faith was followed until the late nineteenth century when it was revived for largely practical reasons. It remained common elsewhere, however, notably in parts of Asia.

Irrespective of the time and place, the mortuary rite of cremation has always formed a complex and multi-faceted mode of disposal of the dead.

Expensive in terms of time and effort, the rite has the potential to generate a variety of archaeological deposits and features. The primary rite of cremation transformed the corpse from one state to another, and was viewed in some cultures to free the spirit/soul, rendering it "inert" and transportable. Secondary rites could include a diversity of actions and uses to which the cremated remains were put, but predominantly it is evidence of the burial which is encountered archaeologically.

The rite can be studied via two inextricably linked archaeological sources – the cremated remains (human bone, pyre goods, and pyre debris) and the contexts in which they are found. The latter chiefly relate to the secondary part (s) of the rite, but much pertaining to the cremation itself may be deduced from the archaeological components recovered within deposits. Inevitably, not all aspects of the rite are likely to be represented or easily accessible archaeologically, but other sources of data – historical, cultural (contemporaneous poetry and art), ethnographic, and anthropological – may enable some of the missing components to be illustrated or further deduced.

Definition

Cremation is a process of dehydration and oxidation effected by the interaction between three basic requirements: sufficient temperature to ensure the corpse will burn; adequate air supply creating oxidizing conditions; and enough time to allow the organic components of the body to oxidize. In modern cremators, these requirements are monitored by computer-linked sensors and are automatically adjusted where necessary. The operating temperature fluctuates during the process (c. 800–1,000 °C) which generally takes c. 1.5 h to complete. Comparable temperatures are routinely observed in experimental pyre cremations; however, a number of variables, some more or less controllable than others, could affect the efficiency of pyre cremation, for example, quantity of fuel, weather, size of the deceased, and materials (such as furs/leather) muffling all or parts of the body from the full effects of the pyre.

Materials

Cremated bone is variously described as "burnt," "oxidized," or "calcined." The latter two are both expressions of one of the two major chemical changes which occur in cremation leaving only the mineral component of the bone (hydroxyapatite, a calcium phosphate) in its fully oxidized state. Although much of the cremated bone recovered archaeologically can accurately be described in these terms, such is not always the case. Full oxidation of the organic components of the body is a requisite of modern Western cremation, but this is not a ubiquitous requirement within other contemporary cultures and may not have been so in the past. Similarly, not all burnt bone would have undergone the mortuary rite of cremation; consequently, the interpretive term "cremated bone" indicates that the mortuary rite has been followed. Ashes are the inorganic remains surviving oxidation of the organic components of a material. The term is not restricted to specific particle size or material type (e.g., bone ash or fuel ash).

Materials cremated and/or buried with the dead allude to beliefs in the nature of and entry point to the afterworld. Material types generally fall into two main categories: personal items "worn" by the deceased ("intrinsic"), linked to dress and display (e.g., jewelry, clothes fastenings, items contained in pouches/bags suspended from the neck or waist); and separate items ("extrinsic"), for example, food offerings and other practical or "personal" items (including "pet" or status animals) the deceased might require for their journey to and/or in the afterworld. Other goods might have represented gifts or mementos from friends or relatives, or ritual offerings not pertaining directly to the deceased.

Pyre and grave goods relate to different parts of the mortuary rite. The former were cremated with the deceased, and parts/all of these items may have been included in the burial but some are often recovered from other forms of deposit, such as redeposited pyre debris, their differentiated distribution sometimes appearing deliberate. Grave goods are unburnt materials (e.g., ceramic table wear in graves of Roman date, Fig. 1) added only during placement within the burial container or grave; some may even have been added as later

Cremation in Archaeological Contexts, Fig. 1 Late Iron Age (0–50 CE) cremation grave Kent, England, containing the remains of an unurned burial (*center-left*) with ceramic grave goods. (© Oxford Wessex Archaeology)

offerings to the revisited grave. Organic materials would also have featured at both stages but confirmation of these items rarely survives. The archaeologist sees only the minimum, but further evidence is accessible via contemporaneous written and visual sources.

Pyre debris represents all the burnt material remaining after cremation following the removal of the bone and pyre goods intended for burial. The major component usually comprises charred wood (remains of fuel) covering a range of particle size (dust-sized particles to lumps of charred log), with variable quantities of cremated bone (not collected for burial) and sometimes pyre goods, and occasionally (dependent on the underlying soil type) burnt flint/clay and fuel ash slag (general hearth slag formed on highly siliceous soils). Other forms of fuel ash may be represented in some geographic areas, for example, peat or (rarely) coal.

Contexts

The deposit types outlined are not comprehensive, but serve to illustrate the range that may be encountered archaeologically. The remains from a pyre might be distributed between a variety of features/deposits within the funerary landscape, having been included in a formal burial, left within the pyre debris (in situ or redeposited), scattered, and/or packaged for curation or distribution to mourners. Some forms of feature/deposit are more frequently encountered than others (graves), more easily recognized (urned burials, burials with grave goods), have better survival rates (e.g., graves under mounds, grüben*busta* – pits over which pyres were constructed, into which the remains fell and which eventually formed the place of burial), or are easier to define. Scatters of cremated bone, for example, may be observed but it can be difficult to deduce if they are accidental (disturbance), incidental, or deliberate deposits. Some disposal mechanisms, such as deposition of some/all the cremated remains in water (as still occurs in modern India), would leave little/no trace in the archaeological record.

The majority of pyre sites formed discrete features, but in some urban environments, where many cremations were undertaken within a designated area (e.g., the Roman *ustrina*), individual pyre sites might not be discernable among a mass of pyre debris. Most pyre sites were probably constructed directly on the ground surface, the necessary up-draught being provided by the structure of the pyre itself. In many soils (clays, silty clays, chalk), clear evidence of in situ burning will

Cremation in Archaeological Contexts, Fig. 2 Reconstruction of a grüben*bustum* (combined pyre site and grave) showing discolouration of the soil, the fall of the fuel ash into the pit and the cremated bone lying on top of the debris

be apparent via soil discoloration (Fig. 2), but elsewhere, such as in calcareous sands or humic/garden soils, there may be no surviving evidence. The visual effects of in situ burning do not penetrate far into the soil (c. 50–100 mm) and all traces could be easily removed by later disturbance, such as ploughing. Associated features, for example, stone surrounds or platforms, may offer greater protection and accessibility. Cut features include under-pyre draught pits or scoops, and deeper pits which may also form the grave (grüben*busta* – see Fig. 2). Pyre sites might have been cleared of debris after use or left with some in situ which could include cremated bone.

The most frequently recorded archaeological cremation-related deposit is the remains of the cremation burial: the cremated bone recovered from the pyre site for formal deposition in a grave. The burial may have been made in an urn (ceramic, glass, or metal). Most vessels were probably sealed, though organic lids are lost during decomposition and even ceramic or stone lids are often destroyed through disturbance (Fig. 3). Unurned burials generally seem to have been made in some form of organic container, evident from concentrated deposits of cremated bone toward or at the base of the grave (see Fig. 1). Even where grüben*busta* were employed as the place of burial, a proportion of the bone was often collected and placed in an urn or some other form

Cremation in Archaeological Contexts, Fig. 3 Late Romano-British (late third-fourth century CE) burial urn from Dorset, England, showing rare survival of the clay plug used to seal the vessel. (Copyright Wessex Archaeology)

of container before being replaced among the pyre debris: NB not all grüben*busta*-style pyre sites also functioned as the grave. Examples of wholly uncontained deposits have also been recovered with the bone spread across the base of the grave (generally stone-lined cists in UK examples). Most burials probably occurred shortly after cremation, however, the portability of cremated remains means this would not always have been the case, particularly where an individual died away from their home (e.g., some Roman military and Norse warriors).

This secondary part of the rite commonly did not require collection and deposition of all the cremated bone. Although a variety of taphonomic factors may affect the quantity of bone surviving in cremation burials (form of burial, disturbance, soil/geology), and some minor temporal and geographic variations have been observed, the average weight of bone included in adult burials from the British Isles, for example, falls within the 600–900 g range (c. 38–50% of the average expected from an adult cremation (fragments >2 mm).

Most cremation burials would have been made in an earth-cut grave but some cultures utilized communal mausolea/monumental structures in which, for example, urns were deposited in niches in the floor and/or walls. The size and form of earth-cut graves varies from small pits just big enough to accommodate an urn (Fig. 4) to relatively large (occasionally substantial) circular or rectilinear features which would hold an array of grave goods in addition to the cremated material (see Fig. 1).

Most graves contained the remains of a single individual but there are variations, some more common than others and some which seem to have been specific to certain periods. A grave might contain:

- A dual/multiple cremation and burial i.e., the remains of two or occasionally more individuals cremated and buried together in a single deposit (adult plus child most common combination)
- A dual/multiple burial i.e., the remains of two or occasionally more individuals cremated separately but buried contemporaneously in individual urns/containers (Fig. 5)
- The remains of one cremated individual buried in more than one vessel ("accessory" burial) or split between an urned and an unurned deposit ("combined" burials)
- An "animal accessory" burial; a human and an entire animal cremated and buried together as

Cremation in Archaeological Contexts, Fig. 4 Early Bronze Age (2200–1600 BCE) urned burial, made in an inverted vessel from Anglesey, Wales

Cremation in Archaeological Contexts, Fig. 5 Early Anglo-Saxon (mid fourth-fifth century CE) grave showing pair of vessels (adult male and adult female) buried contemporaneously (Norfolk, England). (© Norfolk Museums and Archaeological Service (McKinley 1994))

Cremation in Archaeological Contexts, Fig. 6 Group of 20 Early Anglo-Saxon urned burials made within two/three adjacent re-used graves (Norfolk, England). (© Norfolk Museums and Archaeological Service (McKinley 1994))

largely separated deposits, either both urned or with the human urned and the animal remains unurned. Currently in the British Isles these deposits appear restricted to the earliest part of the Anglo-Saxon period (CE 410–530) and the species featured are generally "status" animals such as horse or dog.

- The remains of more than one burial (separate cremations and burial events: Fig. 6)

Cenotaphs are features which have the characteristic appearance of graves, often including pyre goods, pyre debris, and even grave goods, but which are either devoid of or contain very little cremated bone (often less than 10 g). Toynbee (1996: 54) noted the Roman's use of cenotaphs "if a person's body was not available for burial" or "for some person whose remains were buried elsewhere." Numerous examples have been

recorded from Romano-British (CE 43–410) sites and elsewhere in Europe (including France and Sweden), and the practice is likely to have been fairly widespread if relatively infrequent.

Pyre debris may be found in situ at pyre sites, where the distribution of skeletal elements and other materials can reveal vital details about the formation process of the deposit. However, pyre debris is most frequently encountered redeposited as a more-or-less homogeneous mix of archaeological components. It is a common component within cremation graves but is also found in: pre-existent features (Fig. 7) specifically excavated features (i.e., formal deposits of pyre debris); and as surface spreads (particularly within Roman *ustrina*). Its presence suggests that the pyre site was in the vicinity of the deposit and, if not from a cremation grave it will often signify the close proximity of the "burial" to which it relates. Depositions of this type clearly formed a deliberate and significant part of the mortuary rite, and study of the materials within such deposits have revealed significant information pertaining to funerary practices.

The word "token," variously defined as "symbolic," "nominal" or a "memento" has been used to describe burials where only small quantities of

Cremation in Archaeological Contexts, Fig. 7 Early-Middle Bronze Age (2200–1100 BCE) ring ditch (Hampshire, England) showing deposits of pyre debris made from within the confines of the ditch. Context 615 contained debris from a minimum of six pyres. (© Wessex Archaeology)

bone (<100 g; see above) are recovered. The use of "token" in respect to cremation is slightly problematic, as some of the deposits referred to as "token burial" might better be interpreted as "cenotaphs." Others may have formed small, symbolic amounts of bone retained by the deceased's friends or relatives as, for example, the mementoes distributed in eighteenth century Aboriginal Australia (Hiatt 1969). Such deposits might eventually have been buried, perhaps at a much later date, together with the remains of another individual, and there are possible examples of such deposits from Anglo-Saxon (sixth-seventh century CE) inhumation graves. Another potential form of *memento mori* deposit could be represented by the deliberate incorporation of one or two bone fragments from a second individual amongst the cremated burial remains of another.

Osteological Analysis

Osteological analysis illustrates many aspects of the mortuary rite (e.g., McKinley 1994, 2000) Pyre temperature and efficiency of oxidation (demonstrated via thermally induced color variations, shrinkage and warping, and microscopically from the crystal structure); the quantity of bone included in the burial; degree of fragmentation; skeletal elements represented and their distribution; and the form and location of pyre goods can all give insights into the pre-cremation treatment of the corpse and post-cremation manipulation of the remains as well as the pyre technology employed. Outside the various taphonomic factors which may effect many of these attributes, variations have been observed demonstrating the diversity operating within the rite on both a temporal and geographical basis.

Historical Background

Many early Antiquarians dismissed cremated remains as valueless. Improvements in the nineteenth and early twentieth century saw some archaeologists presenting good descriptions of graves and potential pyre sites, but recording was erratic and details of the formation processes, and particularly the relevance of the cremated bone itself, were often overlooked or misunderstood.

As late as the early 1960s in Britain cremated remains were being discarded on some sites and neither they nor the context were being considered in detail, with a tendency to describe all deposits as "cremations." Elsewhere in Europe, particularly in Germany, Poland, and Sweden, cremated remains from sites were being routinely examined from an earlier date, analytical techniques were being developed and the nature of cremated bone was being explored both in Europe and the USA (associated with the development of forensic anthropology).

Over the last two decades of the twentieth century there was a growing interest in the mortuary rite and recognition of its complexity. Observations in modern crematoria, experimental work in laboratories, and numerous experimental pyre cremations have enhanced the understanding of how cremation works and what may be expected to survive at the end of the process. This information has fed-back into the contextual data and enabled a wider appreciation of the various parts of the rite which continues to be explored, together with the potential symbolic relevance of what was being undertaken at different stages. The development at Groningen University (Netherlands) of a dating method for use on cremated bone provided, for the first time, the ability to place unaccompanied burial remains in their correct temporal context.

Key Issues and Future Directions

Archaeologists undertaking the excavation of cremation-related features/deposits have to appreciate that they are dealing with the physical remains of a multifaceted rite from which much can be deduced. Thorough excavation and recovery of the primary archaeological data enables details of the formation processes to be deduced and is essential for future exploration of the rite. Adoption, by both excavators and osteologist, of a common (or at least commensurate) form of reference, excavation methodology, and analytical methods, will allow comparison of cremation data across broader geographic and temporal areas.

State of Knowledge and Current Debates

The Production of Archaeological Knowledge on Crete

The archaeological remains of Crete first reached a wide audience through the accounts and drawings of Renaissance-era travelers, such as the Italian Cristoforo Buondelmonti. Later explorations built upon these works with, for example, Robert Pashley, Capt. Thomas Spratt, and Victor Raulin writing about the island's botany, geology, peoples, and ancient ruins in the eighteenth and nineteenth centuries (early travelers are summarized in Pendlebury 1939). The large-scale excavations of the English archaeologist Sir Arthur Evans at the site of Knossos early in the twentieth century (following on from the oft-overlooked preliminary work by Minos Kalokairinos in the late 1870s) propelled Cretan archaeology into European, if not global, consciousness. Since then, over a century of continuous fieldwork has resulted in Crete becoming one of the best-explored islands in the Aegean region. Although it is most famous for the Bronze Age "Minoan" civilization, named for the mythical king Minos who ruled from Knossos, the island has a long history of settlement, conquest, occupation, and resistance, leading to numerous chronological and material specializations within Cretan archaeology.

The archaeological fieldwork carried out on Crete traditionally has focused on specific areas, in particular Knossos and its environs, the Mesara, and the Gulf of Mirabello. This has been dictated primarily by the investigation of Minoan "palaces," towns, and their hinterlands. In more recent times, the under-explored landscapes of western, southeastern, and upland regions have yielded equally important discoveries, populating the diverse Cretan landscape widely since early prehistory. Surface survey has played an important part in increasing our knowledge of the island's past since the 1980s, both by encompassing large swathes of land and by considering occupation and activity at a diachronic level (e.g., surveys of Vrokastro, Kavousi, Gournia, Knossos, western Mesara, Ayios Vasilios, Lasithi, Sphakia, and Chania, to name a few). These projects tend to combine artifactual and site typologies with studies of geology, geomorphology, environment, ancient literary references, and ethnoarchaeological inquiries, all painting a valuable picture of the island over time. They also serve to counter the early predominance of Bronze Age archaeology above that of all other periods (Table 1). Internationally, archaeology on Crete punches above its weight, thanks to the heavy burden that the Minoan culture bears as the first "European" society. Features like flushing toilets and Art Deco-style frescoes contribute to making this strange past into something familiar, and myths of the labyrinth and Minotaur are deeply embedded in western society. It is no coincidence that the emergence of archaeology proper on Crete correlated with the aim of union with Greece in the late nineteenth century – the antiquities demonstrating that Crete too could play a role in the imagination as home of western civilization. Political exploitation of the past is not restricted to Crete, of course, but for an island with multiple, complex narratives of occupation, archaeologists, Cretans, and the general public alike have been highly selective in the past they choose to prioritize.

Crete, Archaeology of, Table 1 Chronology of main archaeological periods on Crete (all prehistoric dates are approximate)

Neolithic	7000–3200
Bronze Age	3200–1200
Postpalatial	1200–1050
Iron Age	1050–700
Archaic	700–480
Classical	480–323
Hellenistic	323–67
Roman	67 BCE–400 CE
First Byzantine	400–828
Arab	828–961
Second Byzantine	961–1210
Venetian	1210–1669
Ottoman	1669–1898

Since Evans, archaeologists from many countries have played an important role in uncovering Crete's past, working under permits issued to the foreign archaeological institutes based in Greece. Close cooperation with their counterparts in the relevant branches of the General Directorate of Antiquities and Cultural Heritage (itself a branch of the Greek Ministry of Culture and Sports) is essential. Oversight of archaeology on Crete is divided among four main, regional ephorates (Chania, Rethymnon, Heraklion, and Lasithi) alongside those responsible for certain subcategories of material such as caves and underwater sites. These units also undertake year-round rescue excavations as necessary. The somewhat colonial division of Cretan fieldwork by region and nationality (e.g., American projects in the east of the island, Italians in the Mesara, British at Knossos) so prominent during the earlier twentieth century is shifting in the new millennium. International collaboration between scholars is now standard, although the permit system means that officially projects will continue to run under the auspices of specific foreign institutes. Smaller foreign institutes are now following in the steps of the more established ones and also organizing Cretan projects: Sissi is a Belgian expedition, while Priniatikos Pyrgos is Irish-led. The majority of these archaeological projects occur during June–August, when academics and the student volunteers have time off from university. The process of excavation is changing too, moving from the once predominant Wheeler box-grid system to the single context, open area excavation methods developed in contract archaeology and espoused on recent projects like Priniatikos Pyrgos and Azoria. Digital recording technologies are embedded in many projects from their

inception, and the digital and/or online presentation of data facilitates speedy sharing of results. Indeed, the provision of Open Access publications and data online is often a requirement of grant awards, although the extent to which these replace traditional monographs remains to be seen.

The economic crisis of recent years has impacted seriously on archaeology in Greece in general. Funding cuts have slashed the number of people employed by the Ministry of Culture and Sports at all levels, leading to reductions in museum and site openings, delays in processing of permits and applications, and deferral in research and publication of results (Howery 2013). Increased looting at archaeological sites and museums is directly related to this reduction in personnel, although both looting and forging Cretan antiquities for international markets are not a new phenomenon (e.g., Butcher and Gill 1993).

Geography and Economy

The island of Crete is the southernmost and largest of the Greek islands, 245 km long but only 50 km across at its widest, with a total area ca. 8300 km^2 (Fig. 1). Situated at the collision point of the Eurasian and African tectonic plates, the landscape is dominated by mountain ranges (some, such as the western White Mountains, over 2000 m.a.s.l.) and dramatic deep gorges (Fig. 2). Unsurprisingly, seismic activity has affected the island and its inhabitants: earthquakes have caused occasional serious disruption, and coastline levels have changed. Geologically, limestones and the phyllite-quartzite family predominate (Rackham and Moody 1996: 15). Settlement has usually focused along the coastal zones or cross-island communication routes, as well as near fertile land. Upland plateaus like the Lasithi and coastal plains such as the southern Mesara provide good soils for agriculture, while the mountainsides have been terraced since antiquity to extend the cultivable land. The varied Cretan landscape gives rise to a range of ecological niches, encouraging a diversity of botanical and animal life, and the island is home to over 100 endemic plants (Rackham and Moody 1996: 53–73). The current Mediterranean climate of hot, dry summers and mild, wet winters has not always persisted, and data from deep sea, ice, and pollen cores as well as flood deposits sheds light on Crete's climate throughout the Holocene (Rackham and Moody 1996: 33–40; Moody 2005). Agriculture has long been the dominant industry, with olives, viticulture, and sheep rearing especially important, and the related food products remain primary exports. Its strategic location on cross-Mediterranean shipping routes has led to a recurrent role in trade networks and military strategy. Tourism is now of great economic importance too. Knossos is the second most visited site in Greece after the Athenian Acropolis, and archaeology must strike a balance between supporting this industry, monitoring development, and ensuring best-practice site preservation, all the while on increasingly smaller budgets.

Historical Summary

Archaeological survey results from the Plakias region in the south of the island suggest Lower Paleolithic (ca. 130,000 B.P.) and Mesolithic (ca. 11,000–8000 B.P.) occupation on Crete (Strasser et al. 2010), contradicting the long-held belief that human activity only began there early in the Neolithic period. Acheulean lithic artifacts suggest Middle Pleistocene activity in this part of the island at least (Runnels et al. 2014), while stratified microliths from excavation at Damnoni cave in the same area attest to a Mesolithic presence (Strasser et al. 2015). For evidence of more permanent occupation, the earliest Neolithic (ca. 7000 BCE) must still be the starting point. These early farmers brought with them animals and crops typical of the contemporary Neolithic lifestyle of the Near East and Anatolia. An initial aceramic phase at Knossos was the beginning of 4000 years of Neolithic activity there, creating a tell site. No other sites on the island exhibit such a long sequence of early human activity, but Knossos was by no means the only inhabited place. Late Neolithic sites included caves and open-air settlements like Gerani and Sphoungaras, while in the Final Neolithic, site numbers and types increased and included upland defensible locations also such as Monastiraki Katalimata (Fig. 2) (Tomkins 2008).

The transition to the Bronze Age is placed around 3200 BCE (Table 2), and during the

Crete, Archaeology of, Fig. 1 Map of Crete with sites mentioned in text. Map made by J. Day

Crete, Archaeology of, Fig. 2 The Cha gorge in eastern Crete, with two nearby archaeological sites. Photo J. Day

Crete, Archaeology of, Table 2 Bronze Age chronology. Minoan chronology is still much debated, and the dates used here follow Dickinson 1994. All dates are approximate and are BCE

3200–1900	Early Minoan I–Middle Minoan IA	Prepalatial
1900–1700	Middle Minoan IB–Middle Minoan IIIA	Protopalatial
1700–1450	Middle Minoan IIIB–Late Minoan IB	Neopalatial
1450–1200	Late Minoan II–Late Minoan IIIB	Final Palatial (also known as Third Palace period)
1200–1050	Late Minoan IIIC	Postpalatial

following millennium, settlement numbers continued to rise, accompanied by changes in material culture. It is possible that at least some of these social transformations were driven partly by newcomers from overseas, with the Cyclades, the Dodecanese, and Anatolia potential points of origin (Betancourt 2008: 93–94). By the mid-third millennium BCE, sizeable villages had developed in association with fertile land and natural communication routes (e.g., Vasiliki, Myrtos Fournou Korifi). Distinctive Early Bronze Age ceramics, such as Vasiliki Ware and Fine Gray Ware, and divergent burial practices suggest strong local identities, despite the evidence for interregional movement of goods.

The Middle and Late Bronze Age (or Middle and Late Minoan periods) was the time of the so-called palaces, most famously Knossos, Malia, Phaistos, and Zakros. These complex structures were initially considered to be royal residences, but archaeologists now believe that they were multifunctional. Extending around a central court, they provided a place for ritual and commensal events. Areas were also dedicated to storage and craft manufacture (Fig. 3). Two main phases of development, divided by an earthquake

Crete, Archaeology of, Fig. 3 Storage magazine at Knossos. Photo J. Day

ca. 1700 BCE, have been accepted by scholars, leading to the terms Protopalatial and Neopalatial for the First (ca. 1900–1700 BCE) and Second (ca. 1700–1450 BCE) Palace periods. Thriving towns emerged, some adjacent to "palaces" (e.g., Knossos, Malia, perhaps Gournia) (Fig. 4), others as separate settlements (e.g., Kommos, Palaikastro). Neopalatial "villa" sites like Vathypetro, Nirou Chani, and Ayia Triadha shared certain palatial architectural features (e.g., pier-and-door partitions that allow control over the light and air entering rooms; well-carved blocks of ashlar masonry) and were probably also associated with the elite. An administrative system is evidenced by two undeciphered scripts, Cretan Hieroglyphic and Linear A, which occur mainly on clay tablets and sealings. High-quality ceramics, frescoes, faience, metalwork, and ivory and stone carving proliferated, aided by technological developments like the potter's wheel and a wide-ranging network of overseas contacts (see Shelmerdine 2008 for numerous papers on Minoan Crete).

Toward the end of the Late Bronze Age, the island likely experienced a period of domination by the Mycenaeans of mainland Greece. Certainly Linear B tablets from Knossos and Chania were written in the same language (an early form of Greek) and suggest a similar administrative system to that which occurred contemporaneously on the mainland at places like Pylos and Mycenae. Other mainland-style artifacts and symbols replaced or merged with Minoan ones (Preston 2008 on the "Mycenaeanization" of Crete), but this adoption of new practices and things was not necessarily the result of military conquest and could also indicate the movement of people and ideas.

Like other complex societies of the Eastern Mediterranean, Crete experienced major upheavals around 1200 BCE, the causes of which are uncertain but may have included natural

Crete, Archaeology of, Fig. 4 Minoan town of Gournia. Photo J. Day

Crete, Archaeology of, Fig. 5 View across saddle of Karphi. Photo J. Day

catastrophes, overseas raiders, systems collapse, or internal strife. The society that emerged in the Early Iron Age (ca. 1050–700 BCE) was very different from its predecessor. Many sites were abandoned or destroyed, and settlement generally withdrew from coastal zones to upland, relatively inaccessible locations in the twelfth and eleventh centuries BCE. Excavations at Vrokastro, Karphi, Kavousi Kastro, and Kavousi Vronda, for example, show the typical stone-built agglomerative housing of this period; social differentiation is perhaps recognizable in certain features (monumental thresholds) or house size (e.g., Great House at Karphi) (Fig. 5). Other characteristics such as the disappearance of writing, the development of Geometric-style pottery,

Crete, Archaeology of, Fig. 6 Civic center of Lato. Photo J. Day

and the rise in cremation are shared across the wider Aegean world during these "Dark Ages" (Wallace 2010: 23). Growing complexity is evident once again from the tenth century as trade with the east increased, later leading to the "Orientalizing" style in the arts (Wallace 2010: 213).

Nucleation and expansion of some settlements and corresponding abandonment of others characterized the Archaic period (700–480 BCE), during which the foundations for the emergence of the city-state (the *polis*) were laid, often with an associated harbor town (e.g., Lato and its port at Lato Pros Kamara, modern Ayios Nikolaos) (Fig. 6). Some communities seem to have had close links with Egypt, attested by Egyptianizing dedications in sanctuaries and tombs, as well as with the Phoenicians for whom Crete probably served as a stopping point on voyages to their western colonies (Erickson 2005: 625; Wallace 2010: 219). Contact with mainland Greece in this period is attested predominantly by ceramics, such as Laconian kraters, Corinthian aryballoi, and Attic black figure vessels. A proposed period of decline (the "sixth-century gap") based on the lack of textual and archaeological information has been contradicted by recent work at thriving sixth-century settlements such as Azoria and Eleutherna. Even at the site of Knossos, long thought to be devoid of sixth-century BCE activity, the results of the Knossos Urban Landscape Project show that this period witnessed continuous occupation (Trainor forthcoming). Archaic Cretan society probably favored oligarchies, and public display of law codes on civic buildings, most famously at Gortyn, is a tangible reflection of social organization at the time.

Crete did not play an important role in the major conflicts of the fifth-century BCE Greek world, the Persian and Peloponnesian wars, and has often been considered somewhat isolated from the commercial, intellectual, political, and military developments of mainland Greece (Erickson 2005: 622). The island was, however, an important node in pan-Mediterranean trade networks at this time. Coinage using a common standard was first issued by prominent city-states in 470 BCE (Wallace 2010: 361), and ceramic imports from the Peloponnese and Attica, in particular, confound the impression of inactivity. Classical and later Hellenistic times saw increasing conflict on the island, as city-states tried to expand their territory. Larger states like Knossos, Gortyn, and Hierapytna swallowed up smaller *poleis*, occasionally leading to total destruction, such as that which befell Lyttos when it resisted Knossian conquest ca. 220 BCE. Transport amphorae indicate Hellenistic trade with the Dodecanese, Egypt, and the Black Sea (Vogeikoff-Brogan 2004), and ancient texts refer to Cretan mercenaries serving overseas at this time (Chaniotis 1999: 183).

Crete had been sporadically involved in Roman affairs since the early second century BCE, but it was fully incorporated into the Roman world after 67 BCE, when it was conquered by Metellus. United with Cyrene as a province, its capital at Gortyn acquired the trappings of a Roman city; theaters, temples, baths, a circus, and an amphitheater can still be seen across the 200 ha. site today (Fig. 7). In the early Roman era, settlement expanded into the countryside through small farms and villages, while the cities of Asia Minor influenced its art and architecture (Sanders 1982: 30, 135). The rise of Christianity led to the construction of basilica churches across the island, and large country villas appeared later in the fifth and sixth centuries CE, a time of prosperity and peace.

Arab expansion around the Mediterranean in the seventh century CE caused increased military activity, and eventually Crete was conquered in the ninth century, bringing an end to the first Byzantine period (ca. 400–828 CE). Little is known about the ensuing Arab rule, and apart from pottery and coins, only one building has thus far been attributed to this phase (Warren and Miles 1972). The island soon returned to the Byzantine empire following the capture of the stronghold at Khandax (now Heraklion) by general Nikephoros Phokas, commencing the second Byzantine period (961–1210 CE). Close ties with Constantinople characterize this prosperous era when Crete became a "theme" (province) with its own governor, although urban settlements were outnumbered by small rural villages (Tsougarakis 1988: 136).

Following the sack of Constantinople by crusaders in 1204, Crete became the property of Genoa, briefly, and then Venice in 1210. The Venetians faced a strong local resistance to their harsh taxation regime which funded military exploits, although the settlers from Venice received many privileges. Another unpopular move was the restriction on Orthodox Christianity, which was seen as a uniting force for the native Cretans. Venetian remains are some of the most impressive to be seen on Crete today and include fortresses (e.g., Rethymnon, Ierapetra, Frangokastello) (Fig. 8), ship sheds or *arsenali* (Heraklion), Latin churches (e.g., St. Francis in Chania, which has housed the city's archaeological museum), and deserted villages (e.g., Voila). A gradual blending of Cretan and Venetian cultures fostered a distinct artistic environment by the sixteenth and seventeenth centuries, which included skilled fresco and icon painting (El Greco was a Cretan) and literature, most famously the verse romance *Erotokritos*.

The island remained under the control of La Serenissima (Most Serene Republic of Venice) until 1669 when, with the exception of a few

Crete, Archaeology of, Fig. 7 Aqueduct at Gortyn. Photo J. Day

Crete, Archaeology of, Fig. 8 Venetian fortress in Heraklion harbor. Photo J. Day

strongholds like Spinalonga, it was finally conquered by the Ottoman Empire following a lengthy siege at Candia (Heraklion). The subsequent *Tourkokratia* (period of Ottoman rule) lasted over 200 years, but the only remains visible of this era today are occasional fountains and mosques. Numerous rebellions during this period sought to gain Cretan freedom, most famously those of 1770 led by Daskalogiannis, of 1821–1830 triggered by the Greek War of Independence, and the Cretan Revolt of 1866–1869 (Detorakis 1994: 278–346).

It was not until 1898 that Crete finally became autonomous, aided by the Great Powers of Europe. The next goal was *enosis*, or union with Greece, which was achieved in 1913. Crete's history from this point onward is closely intertwined with that of the rest of Greece. The forced removal of Cretan Muslims in a population exchange with Turkey in the early 1920s was a traumatic event for the island (Koufopoulou 2003). During World War II, Allied-controlled Crete was subject to an airborne invasion by Nazi Germany in May 1941, the "Battle of Crete." Despite the bravery of the Cretans and Allies alike (including archaeologists like J.D.S. Pendlebury whose detailed knowledge of the island was put to strategic use), the defending troops were evacuated, leaving the island occupied by German and Italian forces. The resistance movement fought on until the end of the war, and exploits such as the kidnapping of General Kreipe meant that the Germans enacted brutal reprisals on the civilian population. The rapidly disappearing material traces of the invasion and resistance belong to a recent past that deserves more systematic archaeological investigation than has thus far been attempted.

Current Debates

The results of over a century of intensive archaeological fieldwork on Crete and paradigmatic shifts within the discipline are impressive: detailed information is available on artifact typologies, settlement patterns, site types, chronology, and diachronic changes in society. Bronze Age archaeology has emerged from the shadow of Classical archaeology, to be recognized and practiced as the study of a distinctive prehistoric society. This is tied to a change in emphasis more generally within the archaeology of the ancient Mediterranean, now a field less focused on iconography (as exemplified by studies of Classical figural pottery) and more on social and ideological processes. The international makeup of archaeologists working on Crete means that research is subject to the influences of different academic

traditions. In the 1980s, inspired by New Archaeology and its processual methodologies, many archaeologists on Crete embraced advances in archaeobotany, faunal studies, survey methodology, and sampling strategies. The influence of post-processual thinking is also evident, albeit mainly within Bronze Age archaeology, as issues like gender, commensality, and ritual practice are considered. On the other hand, a claim that Greek archaeologists adhere firmly to Classical training and reject modern methodological and theoretical changes (Kardulias 1994: 375) may still be applicable to some in an older generation of scholars. Yet as archaeology becomes more reflexive, past and present research agendas are being re-evaluated. For example, the term "Minoan" has been problematized as a modern construct, laden with the baggage of Evans's Edwardian worldview (see various papers in Hamilakis 2002). Similarly, periods outside the Bronze Age that for so long were eclipsed by Minoan-centric studies are now receiving attention. Crete's rich Byzantine heritage, its Venetian cultural mix, and the Archaic-Classical periods are becoming clearer. Five current debates that cross temporal boundaries within the discipline are outlined below.

Origins

The discovery of Paleolithic and Mesolithic artifacts on the island has renewed interest in the question of when Crete was first settled, as well as in the wider implications of such occupation. Potential Miocene tetrapod footprints with hominin-like characteristics recently have been identified at Trachilos, in the west of the island (Gierlinskì et al. 2017). Should this surprising find be accepted by the academic community (and this is by no means guaranteed at the time of writing), it would indicate either a very early presence (just over 5.6 Ma) of hominins in the area now known as Crete or a previously unrecognized primate (Gierlinskì et al. 2017). While Miocene visitors would have had access via the Greek mainland which was connected to Crete until ca. 5 million years B.P., the Paleolithic arrivals must have come across the sea. If they arrived on the island by boat from the north, the east, or Africa, this is of great significance in understanding the capabilities of early humans for seaborne travel and for hominin arrival and dispersal in Europe (Strasser et al. 2010). Crete's distinctive Pleistocene fauna, including dwarf hippos and elephants, did not survive into the Holocene epoch (Rackham and Moody 1996: 47–48); can their extinction be linked to these first peoples?

Neolithic and Early Bronze Age studies have also been revitalized within the last 10 or 15 years. Cretan Neolithic chronology has been revised to bring terminology into line with that used for the Greek mainland (Tomkins 2008) and the continual discovery and publication of Neolithic era sites means there is now a significant body of material to draw upon. The Knossos-centric approach to the island's first farming communities is diminishing in the face of this emerging evidence for widespread Neolithic occupation. These were not isolated communities; the distribution of nonlocal materials such as ceramics and stone tells of intraisland interaction from earliest times (Tomkins 2008: 28). By the Final Neolithic period, in the late fourth millennium BCE, some communities such as Kephala Petras demonstrate considerable overseas links too, attested by obsidian from Melos, non-Cretan ceramics, copper, and *Spondylus* shell (Papadatos and Tomkins 2014). These goods and technologies were not just valued in themselves as new materials but for the symbolic and political capital they brought to communities and to individuals within them.

The ensuing Early Minoan period is no longer viewed simply as an uneventful predecessor of the palatial periods but as a millennium worthy of study for the complexity demonstrated by technological, social, and economic changes (Betancourt 2008). The tensions between "households" and "communities" in relation to social development have been fruitfully explored for this period, recognizing the variety of dwelling and experience covered by each of these broad terms (Schoep and Tomkins 2012: 13–14). Unsurprisingly, the Early Minoan period has been scrutinized for the origins of the famous Minoan "palaces" of the Middle and Late Bronze Age. Traditional opinion purports that these complexes first appeared on Crete ca. 1900 BCE, perhaps inspired by overseas

models in the Near East, but it now seems that they may have roots in the indigenous, large structures of the Early Bronze Age (e.g., at Malia) or even at Neolithic Knossos.

Throughout its history, Crete has hosted continual waves of newcomers, each leaving distinctive marks not only in the archaeological record but also in the islanders' identities. Whether the use of Linear B to write Greek indicates a mainland Greek identity or origin for at least some of the islanders during Late Minoan IIIA–IIIB remains debated (Preston 2008). Conversely, Archaic inscriptions from east Cretan *poleis* are written in Greek script but the language is not Greek. This language has been linked to the Eteocretans ("true Cretans" – perhaps descendants of the Bronze Age populations), who were associated with the Praisos region in Classical literature. The mingling of Latin and Greek peoples and cultures that occurred during Venetian rule (McKee 2000) and the deserted Muslim villages serve as reminders of just how mutable island society has been.

Palaces, Poleis, Pashas

The varying nature of regional and island control throughout Crete's settlement history is another key research theme. It has long been thought that the Minoan "palaces" functioned as regional administrative centers, although the extent of their ritual, economic, political, or ideological dominance is unclear. This interpretation is based on the Mycenaean system and hence may have limited applicability to earlier times. Other ways of understanding the complexity of palatial era society without using an anachronistic or top-down approach have been sought (e.g., peer-polity interaction). The "palaces" as entities still demand explanation, however, and it is not only their function(s) that remains uncertain, but so too the very definition of what exactly is, or was, a "palace." Recently discovered court-centered complexes at Galatas and Petras, for example, add to the growing number of sites given this appellation, and debate continues about the Gournia "palace" also. It is becoming clearer that "palaces" had varying construction and occupation histories and that exact parallels in function between Protopalatial and Neopalatial complexes are unlikely. Moreover, Crete in the Bronze Age was a land of regional diversity (as it still is), and seeking overarching explanations for any kind of social transformation is redundant.

Moving into later periods, Crete was referred to by ancient sources as being a land of 100 *poleis*. Archaeological exploration of these early city-states permits consideration of the development of urban centers, the links between these centers and their hinterland, and the political economy of the island during Archaic times (Haggis et al. 2004: 345). Unlike the tyrannies that emerged elsewhere in Greece, in Cretan *poleis* power rested in the hands of councils (*kosmoi* and *gerontes*) made up from elite clans (Wallace 2010: 358). Planned urban development at Archaic sites such as Azoria and Dreros included city walls and public buildings with ritual and political functions, revealing cities as materializations of their civic identity (Haggis et al. 2004: 393).

Knowledge of administration of the island in Byzantine, Venetian, and Ottoman times is based primarily on textual sources and suffers from being understudied in comparison to the earlier periods. Much of this work is published in Greek or Turkish, which has also impacted on the international impact of such research. In particular, economy, taxation and land usage are popular fields of study for these periods, and archaeological surveys often include these later eras in their studies of diachronic landscapes (Brumfield 2002 combines both approaches). Catalogues of archaeological remains like Ottoman tombstones (Fig. 9) and other monuments (*The Ottoman Centuries* by FORTH) or studies of Byzantine ceramics (e.g., Klontza-Jaklova 2015) are all contributing to slowly broadening our understanding of the later periods of Cretan administrative history.

Trade, Economy, and Overseas Interaction

Thanks to its location between North Africa, Europe, and the Near East, the island has long been an important transshipment point on sea voyages, as well as a destination in its own right. Crete and the Cycladic islands to its north have had a close relationship since the Mesolithic –

Crete, Archaeology of, Fig. 9 Ottoman-era tombstones outside the Stratigraphic Museum, Knossos. Photo C. Trainor

finds of obsidian microliths at Damnoni attest to ninth millennium BCE links with Melos. This contact increases during the Final Neolithic and Early Bronze Age, with so-called gateway communities along the north coast of the island such as Kephala Petras, Mochlos, and Priniatikos Pyrgos receiving not just obsidian but ceramics and copper, some of which was then traded or exchanged to the southern Cretan coast (Papadatos and Tomkins 2014). Indeed, during the Early Minoan period, some sites appear to have had very close ties with the islands to the north of Crete (leading to suggestions of Cycladic settlers in early publications), such as the cemetery of Hagia Photia with its Cycladic-style burial customs and material culture and actual Cycladic imports mixed in with indigenous products and technologies.

During the Late Bronze Age, Cretan elites participated in an Eastern Mediterranean exchange network of prestige goods such as ostrich eggs, copper ingots, faience, perfumed oils, and spices. The nature of this interaction is unclear: to what extent was the movement of goods due to gift exchange or trade, and what was the role of traveling craftworkers or iconographic and ideological transfer in the spread of material culture? Certainly, the theory that a Minoan thalassocracy, or sea empire, was responsible for the Minoan-style material culture at places like Akrotiri on Santorini, Ayia Irini on Keos, and as far afield as Tell el-Dab'a in the Egyptian Delta has been replaced by more nuanced levels of interaction.

The location of Crete's main overseas partners changed after the Bronze Age. Some communities developed close ties to Cyprus and Phoenicia, and eastern imports like bronzes and ivories increased during the Iron Age. Unlike many mainland Greek states, Cretan *poleis* had no colonies to form natural trading partners, and the sixth century saw a decline in Orientalizing motifs and a swing toward relations with the west. It is thought that the eastern and western ends of the island now favored trade with different parts of Greece; the west formed links with the Peloponnese, as attested by finds of Laconian and Argive pottery at Eleutherna, Lappa, and Kydonia, while the east looked to the Cyclades, as indicated by finds at Olous, Azoria, and Itanos (Erickson 2005: 630–631). The lack of imported ceramics dating from 460 to 400 BCE is puzzling and may reflect a cessation of overseas trade, perhaps caused by Athenian pressure during the Peloponnesian War (Erickson 2005: 656). From Classical through Roman times, the island exported agricultural produce including wine, oil, wood, fish (evidenced by rock-cut coastal fish tanks, e.g., at Siteia), and murex. The southern ports became important stopping points on the grain route from Egypt to Rome. In return, imports from around the Roman Empire flowed into the island, such as granites from Egypt and ceramics like Phocaean Red Slip Ware. Cretan sweet wine was

exported in great quantities during the Venetian era, apparently at the expense of grain production; under the Ottomans, the opposite occurred, but olive oil became the dominant export crop (Brumfield 2002: 42–43).

The identification of harbors and shipwrecks is an important aspect of the study of Cretan trade. Archaeology and textual sources combine to identify harbors around the coast, such as the Bronze Age sites of Kommos, Poros-Katsambas and Gournia (where Minoan ship sheds have been recently discovered), or Hellenistic Lato Pros Kamara. Roman prosperity in particular encouraged the growth of coastal towns at the expense of those inland – e.g., Polyrrinia dwindled while its port at Kissamos flourished (Sanders 1982: 31). Undersea exploration augments our knowledge of Cretan trade throughout the ages, and shipwrecks provide unique snapshots of interconnections at discrete moments in time. Middle Minoan II ceramics in the sea near Pseira may indicate a wreck once lay here, but the wooden hull has not survived its long immersion; this is a persistent problem when seeking prehistoric shipwrecks, which, combined with sedimentation from the dynamic seabed and bottom trawling, makes the likelihood of any intact Cretan finds slim. A second potential Minoan shipwreck has been reported at Koulenti, off the coast of Laconia, but publication is pending at the time of writing. Later wrecks around the island are attested by their cargo too; for example, several Roman and post-Roman wreck sites have been identified around the island of Dia, just north of Heraklion.

Ritual Practices and Places

Today the Cretan countryside is dotted with small chapels, but the close link between ritual practice and landscape goes back millennia. The use of caves for rituals probably dates to Neolithic times and is a more plausible explanation of the earliest skeletal and ceramic finds than their use as dwellings, stores, or refuges. In the Bronze Age, subterranean deposition of bronze figurines and fine ceramics occurred (e.g., the Kamares and Psychro caves) (Fig. 10). Some caves continued to be visited for ritual purposes into historic times; the Idaean cave, high in the Psiloritis range, has produced offerings including seventh-century BCE bronze shields. The dedication of such goods in sanctuaries enhanced the prestige of the giver and was a common practice across Greece at this time. Cave chapels can still be found; some of these, such as Melidoni (the site of a siege between Ottomans and Cretans in 1823), should be linked to their prior use as places of refuge.

Minoan-era communities worshipped at mountain shrines also, leaving votives of human and animal figurines and making offerings of food or feasting there. These peak sanctuaries have been

Crete, Archaeology of, Fig. 10 The entrance to the Kamares cave. Photo J. Day

poorly served by academia, however, with few being both fully excavated and fully published (Haysom 2015: 94). Nevertheless, at Kophinas and Vrysinas, for example, careful analysis of ceramics is allowing a clearer understanding of the chronologies of and activities at these sacred places. Architectural features of the "palaces" like lustral basins and pillar crypts suggest that rituals were carried out there too, some perhaps deriving from those that occurred in the natural environment, e.g., pillar crypts standing in for caves in an urban environment. Despite a wealth of iconographic and material remains, the actual deities worshipped and beliefs held by the Bronze Age Cretans are unknown. Linear B includes the names of Mycenaean divinities (e.g., Poseidon, Zeus), but whether there was any similarity with the later Classical gods beyond a shared name is unclear.

Extra-urban sanctuaries were used in later periods too, such as that of Hermes and Aphrodite at Kato Symi. By Archaic times, however, worship in Crete mainly occurred in the temples familiar from the wider Greek world. The small eighth-century BCE temple at Dreros is one of the earliest free-standing temples in the Greek world, while seventh-century Temple A at Prinias is the earliest such building with sculptural decoration. A contemporary potential Phoenician tripillar shrine at Kommos suggests that foreigners (settlers or passing traders?) may have worshipped at this port town. Epigraphic, numismatic, and literary sources show that Roman Imperial cult came to Crete, but of greater significance for archaeology of religion was the emergence of Christianity. Following the appointment of Titus as the first bishop of Crete by St. Paul during the first century CE, Early Christian basilicas replaced temples to the Olympian deities. Excavations of these buildings are rare, but surviving examples dating mainly from the fifth and sixth centuries suggest that simple three-aisled structures with a nave and narthex were customary (Sanders 1982: 89).

Funerary rituals also provide food for thought. The Early Minoan stone tholoi of the Mesara are among the most impressive tombs on the island. These monuments for communal burial would perhaps have served as markers of territory and identity, while the periodic cleaning events brought kin groups or communities together. Fewer burials of Palatial-era Minoan society have been discovered, although chamber tombs, some with weapons among the grave goods, were in use by Late Minoan IIIA, indicating a change in beliefs (e.g., Sellopoulo). The iconography of Late Minoan clay larnakes is intriguing and may provide glimpses of belief in an afterlife. The North Cemetery at Knossos has yielded over 100 Early Iron Age graves, many with rich grave goods. Archaic and Classical burial practices varied, with interments in pithoi, pits, cists, and rock-cut tombs. Christian inhumation practices were diverse, too, and include rock-cut *loculi* tombs at Lappa and Matala that were inhabited by hippies in the 1960s.

Consuming, Remembering, and Sensing

Recent archaeological engagement with food consumption is reflected in the studies of the diachronic social roles of feasting. Faunal assemblages and sets of elaborate drinking and serving vessels from throughout the Bronze Age indicate the importance of eating and drinking events, arguably as venues for negotiating social position. In the Early Iron Age, communal dining is again suggested by archaeology, ranging from large tripod cooking pots at Chalasmenos (Fig. 2) to sizeable buildings such as Kavousi Vronda's "Big House," which perhaps hosted communal events. Ancient texts describe the Archaic and Classical *syssition*, a combination of a shared meal and political institution, as a distinctive feature of Cretan *poleis* (Erickson 2011). These daily meals for the urban elite, financed by taxes and personal contributions, occurred in large, purpose-built structures or *andreion* such as that excavated at Azoria (Haggis et al. 2004: 387–390). Distinguishing between *andreion* and early temples can be problematic, and undoubtedly overlap existed between the social, religious, and political functions of these buildings. More easily identifiable is the later *Prytaneion* at Lato, where city officials dined (Fig. 6, *Prytaneion* at the top left of the central staircase).

The continued occupation and rebuilding at certain Cretan sites such as Knossos has been interpreted as fostering a deliberate link between past and present, perhaps at key cosmological centers or seats of power. Ruins of older structures would have been visible at such palimpsestic sites and in some cases received special attention. For example, Early Iron Age cult was practiced at older Bronze Age remains at numerous sites (e.g., Knossos, Phaistos, Amnisos, Palaikastro), while ninth-century BCE Knossians imitated and reused large Bronze Age chamber tombs (Prent 2003). These conscious attempts to associate themselves with the past were perhaps integral to legitimizing the authority of a rising aristocracy (Prent 2003: 91). The curation of heirloom objects may be another manifestation of this interest in memory across different periods, and Classical era coins from Knossos bore a labyrinth, stressing the long, mythical past of the site.

Feasts, rituals, and funerary ceremonies in ancient Crete have all been reconsidered in terms of the creation and manipulation of sensory, bodily experiences to create embodied memories with political and social significance. Indeed, the sensory turn in arts, humanities, and social sciences of the last 20 years has filtered through to Cretan archaeology more broadly, and artifacts and monuments have been approached through this new lens with stimulating results, at least for the Bronze Age. Hamilakis' (2014) exploration of Minoan Early Bronze Age tholoi and later "palaces" using concepts such as "sensorial assemblages" and "sensorial flows" highlights how the human body and the world around it are an unpredictable blend of materials, movements, and memories. It remains to be seen whether his call for a paradigm shift in how we do archaeology materializes any time soon.

Criado-Boado, Felipe

Alfredo González-Ruibal
Institute of Heritage Sciences (Incipit), Spanish National Research Council (CSIC), Santiago de Compostela, Spain

Basic Biographical Information

Felipe Criado-Boado is an archaeologist specializing in landscape archaeology, archaeological theory, and heritage studies. He was born in 1960 in Santiago de Compostela (Spain), in whose university he graduated (1982), obtained a PhD (1989) and taught until 2000, when he became research professor at the Spanish National Research Council (CSIC). He spent an academic year in Cambridge (1986–1987), at the time of the emergence of post-processual theory. At present, he is the director of the Institute of Heritage Sciences (Incipit) of the CSIC and since 2015 president of the European Association of Archaeologists (Fig. 1).

Major Accomplishments

Felipe Criado-Boado is one of the most influential theoretical archaeologists in the Spanish-speaking world and the author of an original and ambitious theoretical model for the discipline. During the heyday of post-processualism, he turned his attention to structuralism. Inspired by Lévi-Strauss, he developed the first systematic structuralist paradigm in archaeology (Criado-Boado 2000), together with colleague Almudena Hernando. He also drew upon the work of anarchist anthropologist Pierre Clastres. From Lévi-Strauss, Criado-Boado took the idea of "thought" (*pensée*), which

Criado-Boado, Felipe, Fig. 1 Felipe Criado-Boado

in the last instance boils down to the savage-domesticated dichotomy and from Clastres he adopted the concept of society, where the main difference is between divided and undivided societies. From the latter, he also borrowed the notion of social resistance, which he applied to the Neolithic and other contexts.

Structuralism deeply influenced Criado-Boado's views on landscape and on the production of archaeological reasoning. In the late 1980s and early 1990s, he wrote a series of highly influential papers, particularly in Iberia and Latin America, on the archaeology of landscape, where he outlined the main principles of his paradigm. The empirical basis for his theoretical proposals was his own work on Neolithic megaliths in NW Iberia. He moved away from the functionalist perspective of the megalith as a territorial marker to the megalith as part of a system of thought, which he labelled "post-savage." Post-savage thought evinces a transformation of the rationality characteristic of hunter-gatherers and early cultivators, particularly in terms of the nature-culture relationship (Criado-Boado 1989). From this perspective, monuments would not be just an index of the domestication of nature but of the domestication of savage thought (Criado-Boado 2000: 278). The nature-culture relationship was further explored in subsequent papers.

Thus, Criado-Boado (1993) argued that there exist four attitudes in human societies in relation to nature: passive, participative, active, and destructive. The passive attitude would be characteristic of hunter-gatherers; the second would encompass all the communities with a non-permanent agriculture both in the past and in the present. According to Criado-Boado, in these societies, there is a close relationship between nature and culture, in that social reproduction depends on the natural reproduction of the environment. Therefore, the Neolithic would have implied a *naturalization of culture* and not a *domestication of nature*, as has been traditionally maintained. The domestication of nature proper would characterize those communities that have an active stance toward the environment. Farmers practicing intensive agriculture would be the best representatives of this attitude and of domesticated thought more generally, which implies a heavy modification of landscape. Finally, a destructive stance would be associated with modern societies. These different attitudes are not to be regarded as evolutionary stages but as forms of rationality (Criado-Boado 2000).

Criado-Boado also explored the conditions of visibility of the archaeological record (Criado-Boado 1995). He defends that the greater or lesser visibility of the archaeological record is not arbitrary but structurally related to "cultural rationalities, attitudes towards space, and modes of conceptualisation of the nature/culture relationship" (Criado-Boado 1995: 195). He argues that we can isolate a specific "will" to render the result of social action visible or invisible. He distinguishes four main "strategies of visibility": (1) *inhibition* or the absence of any attempt at rendering social actions visible; (2) *hiding*, which is the result of a conscious will not to visibilize social action; (3) *exhibition* or the intentional materialization of the processes of social action, and, finally, (4) the *monumental* strategy, which differs from the latter in that social processes are not only materialized spatially but also projected temporally into the future. The absence of monuments and material traces can be considered in Clastrian terms as a rejection of inequalities (Parcero and Criado-Boado 2013).

From the mid-1990s, Criado-Boado developed an interest in cultural heritage, in part stemming from his work as head of a team engaged in culture resource management. Indeed, he saw landscape archaeology as a way of managing cultural landscapes. Criado-Boado introduced the notion of "cultural heritage value chain" (*cadena de valor del patrimonio*), which understands that primary entities are transformed into heritage through acts of identification, documentation, signification, value-making, dissemination, circulation, and reception. He would later incorporate the criticisms raised against dominant views by public archaeology and diverse critical paradigms (indigenous, postcolonial, and community archaeologies) (Criado-Boado et al. 2015).

Underpinning these theoretical proposals stands a larger epistemological theory on the nature of archaeological knowledge (Criado-

Boado 2001). Criado-Boado sought a third-way between what he criticizes as the hyper-subjectivism of post-processual hermeneutics and the neoempiricism of processualists. He proposes a structuralist-inspired methodology that controls subjectivist excesses in interpretation. In the case of Neolithic megaliths, this methodology is based on detailed analyses of locational patterns of monuments, their visibility and intervisibility, which allows him to recognize part of a prehistoric rationality and phenomenology (Criado-Boado 2000). More recently, he has resorted to experiments in visual perception, using eye-tracking, to identify patterns of visual exploration. These vary depending on sociocultural context; thus, horizontal eye movements are dominant in periods with lesser social division, whereas vertical movements are more frequent in periods marked by greater social complexity (Criado-Boado et al. 2019).

Crimean Late Middle Paleolithic to Early Upper Paleolithic Transition

Yuri E. Demidenko
Crimean Branch, Institute of Archaeology, National Ukrainian Academy of Sciences, Simferopol, Crimea, Ukraine

Introduction

For a long time, data regarding the Late Middle Paleolithic-Early Upper Paleolithic (hereafter LMP and EUP) transition was too poor to obtain a real understanding of cultural processes during this period. On one hand, the absence of reliable absolute dates for Middle Paleolithic sites prevented identification of true LMP industries in Crimea. On the other hand, EUP data is limited to only the 1920s excavations of the lower and middle layers at Siuren I rockshelter, generally

interpreted by Soviet colleagues as unclear Aurignacoid assemblages situated during the Last Glacial Maximum. Although the presence of some Middle Paleolithic artifacts among the Upper Paleolithic artifacts in the lower layer led to speculation regarding either local or intrusive origin of EUP humans with "Aurignacoid"/ "Aurignacian-like" assemblages in Crimea, it was not possible to propose a well-grounded hypothesis on the subject. As a result, Crimea remained on the "side of the road" for Middle to Upper Paleolithic research in Europe from the 1950s to the early 1990s.

Key Issues/Current Debates

The 2000s Concept of the LMP-EUP Transition

The situation changed dramatically in the 1990s and the early 2000s after new excavations of both known and newly discovered Middle Paleolithic and Upper Paleolithic sites in Crimea, a significant number of absolute dating results and data obtained from the natural sciences related to LMP-EUP transition. For the EUP, excavations took place at Siuren I rockshelter in 1994–1997 and at a new site, Buran-Kaya III grotto, between 1990 and 2001, although both sites also contain LMP components. For the LMP, new excavations at Kabazi II and V, and new dates for Zaskalnaya V and VI, Prolom I and II, and Kiik-Koba, allowed Victor Chabai to identify a set of Late Levallois-Mousterian/Western Crimean Mousterian and Late Micoquian assemblages in Crimea. It was then possible to propose a hypothesis for the LMP-EUP transition that also corresponded to most LMP and EUP data for the East European record (Chabai 2004). Additional data were later added to the 2004 concept (Chabai 2008; Demidenko 2008).

The LMP-EUP transition is proposed to be viewed as a rather lengthy period (7–8000 years) of coexistence of LMP and EUP complexes and is subdivided into two stages.

The *first transitional stage (Les Cottes/ Huneborg Interstadial and Huneborg Stadial: c. 36–32 ky uncal BP)* precedes the Arcy Interstadial, and apart from the coexistence of LMP and EUP industries, is also characterized by the absence of Aurignacian industries in Crimea. The LMP is represented by the Levallois-Mousterian/Western Crimean Mousterian and Crimean Micoquian Tradition. The Late Levallois-Mousterian is known from Kabazi II, levels II/7 to II/1 and Kabazi V, levels III/3-3A to III/3–1 in western Crimea. The Late Micoquian is known from more sites, in both western and eastern Crimea, and at least two types of the industry relate to the stage: Kiik-Koba type (Kiik-Koba, upper layer; Prolom I) and Ak-Kaya type (Zaskalnaya V, layer II; Zaskalnaya VI, layers IIIa–II; Kabazi V, levels III/2A and III/2). On the other hand, the first EUP industry, the "Eastern Szeletian," appeared in Crimea at Buran-Kaya III, level C, during the stage's second stadial phase – Huneborg. The "Eastern Szeletian" is characterized by bifacial "biconvex" leaf points, bifacial trapezes, end-scrapers, and a series of worked bone tubes (see in Chabai et al. 2004). Thus, two LMP industries and one EUP industry have been connected to the first transitional stage.

The *second transitional stage (Arcy Interstadial: c. 32–28 ky uncal BP)* features not only further coexistence of the two LMP industries and the absence (!) of the "Eastern Szeletian" but also the appearance of Aurignacian industries in Crimea. The Levallois-Mousterian persists at Kabazi II, levels II/1A to A4 in western Crimea. Again, Crimean Micoquian Tradition sites are known in both western and eastern Crimea and all three variants are present: Ak-Kaya, Kiik-Koba, and Starosele. The latest Micoquian of Ak-Kaya type has been identified at Kabazi V, levels II/7 and II/4A in western Crimea. The latest Micoquian of Kiik-Koba type has been proposed for Buran-Kaya III, layer B and Micoquian finds at Siuren I 1920s lower layer/1990s Units H and G in both eastern and western Crimea. The latest Micoquian of Starosele type is proposed at Zaskalnaya V, layer I and Prolom II, layer II in eastern Crimea, and Kabazi V, levels III/1A and III/1 in western Crimea. Finally, Aurignacian industries emerged in Crimea – the Proto-Aurignacian with Dufour bladelets at Siuren I, 1920s lower layer/1990s Units H and G, and the

Evolved Aurignacian with Roc de Combe microblades at Siuren I, 1920s middle layer/1990s Unit F.

By region, only the Latest Micoquian occurs in both western and eastern Crimea. The Late Levallois-Mousterian is known with late dates only in western Crimea, although some levels at eastern Crimean sites could also belong to the LMP-EUP transition. "Eastern Szeletian" and Aurignacian complexes are found at single sites (Buran-Kaya III and Siuren I), the former in eastern Crimea and the latter in western Crimea. At the same time, it is worth noting the occurrence of all four Crimean LMP and EUP industries at some sites in the Lower Don river region and/or Northwestern Caucasus (Chabai 2004; Demidenko 2008). These two regions, along with Crimea and the territories between the Lower Dniester and Lower Dnieper rivers, form the Great North Black Sea region in the south of Eastern Europe. Accordingly, the 2000s concept of the LMP-EUP transition with two stages appears to correspond well to the whole south of Eastern Europe region.

The following archaeological data are characteristic of the LMP-EUP transition. First, the Aurignacian was not the chronologically first EUP industry. The often assumed role of the Aurignacian in acculturation processes leading to local origins of the EUP following interaction between Middle Paleolithic Neanderthals and Aurignacian *Homo sapiens* is therefore more than doubtful for this region. Rather, the coexistence of several LMP and EUP industries in the Great North Black Sea region must be postulated. This very probably did not take the form of a literally synchronous co-occurrence of LMP and EUP humans in the same area but would have occurred in the form of alternating and discrete occupations. Such a situation is demonstrated by a series of intermittent visits to Siuren I by Aurignacian *Homo sapiens* and Micoquian Neanderthals during rapid deposition forming the 1920s lower layer/1990s Units H and G (Demidenko 2000). Furthermore, the Micoquian layer B and the "Eastern Szeletian" level C at Buran-Kaya III are even more suggestive in this sense since here the EUP level is stratigraphically situated *below* the Middle Paleolithic level. This model is also supported by the absence of any features in the lithic industries suggesting mutual influence between contemporary LMP and EUP industries. Indeed, there is no evidence of borrowing of any traits or elements between industries. That is, no EUP (either Szeletian or Aurignacian) trait/element can be observed within the Micoquian and Levallois-Mousterian industries and vice versa. Therefore, the term "geochronological coexistence" of LMP and EUP industries at best reflects the situation for the transition, where Buran-Kaya III and Siuren I show movement of human groups that made it highly unlikely that different hominins encountered one another, especially given the absence of archaeological evidence for such contact.

Thus, Crimea is seen as a "melting pot" of various LMP and EUP hominins between c. 36 and 28 ky BP. Moreover, the south of Eastern Europe acted as a crossroads for migration routes of LMP and EUP hominins and provided the setting for their geochronologically independent and mutually exclusive existence. As a result, the transitional period represents a mosaic, in which local LMP hominins with Micoquian (made by Neanderthals) and Levallois-Mousterian industries continued to survive, while contemporaneous EUP technologies (made by *Homo sapiens* for the Aurignacian) were imported by "immigrants" from other regions, Eastern Europe for the "Eastern Szeletian," and Central Europe and possibly Levant and Middle East for the Aurignacian (Demidenko 2008, 2011a, b). Accordingly, the Late Crimean Neanderthals do not represent one of their last pure refuge "islands" but are rather found in a context of complex Paleolithic human history.

The Early 2010s Challenges to the 2000s Concept

New data has, however, been obtained in the last few years that challenges in part this seemingly perfectly substantiated industrial-chronological structure of the LMP-EUP transition in the Great North Black Sea region.

Two key sites for Crimea (Siuren I and Buran-Kaya III) and Mezmaiskaya Cave in Northwestern Caucasus have provided new information that necessitates revisions to the geochronology

and/or industrial status of the LMP and EUP levels at these sites.

Siuren I

Systematic AMS dating of 25 ungulate bone samples from Units H, G, and F was carried out at Oxford (partially with pretreatment at the Max Planck Institute for Evolutionary Anthropology in Leipzig), Groningen and BETA (Florida) labs in 2009–2011. These results were combined with eight additional bone samples from the 1990s excavations selected for AMS dating at Oxford. In total then, 33 bone samples were selected to attempt to obtain AMS dates for the site's middle (Unit F with Late/Evolved Aurignacian finds) and lower (Units H and G with both Proto-Aurignacian and Micoquian finds) levels (Demidenko et al. 2012; Demidenko et al. in press).

Of these, only 11 AMS dates fall within the Aurignacian sensu stricto time span. These are as follows (uncalibrated): Unit H (two dates), c. 30.5 and 28.4 ky BP; Unit G (two dates), c. 28.2 and 28.0 ky BP; and Unit F (two dates), c. 30.9 and 26.6 ky BP. These dates, like the three AMS dates obtained in the 1990s for Unit H and level Ga, both c. 28 ky BP, and level Fb1-Fb2 c. 29 ky BP, indicate rapid deposition for the three units as the dates are nearly statistically identical. Since all dates for Units H and G were obtained only on ungulate bone (with collagen problems for bone artifacts), it is reasonable to exclude the younger dates on three bone artifacts from Unit F dating to c. 28.2–26.6 ky BP. In this case, Unit F dates are within the narrower interval of c. 30.9–29.4 ky BP, and the dates for the three units become indeed identical.

Yet the "collagen presence/absence" issue for bone samples used for the Siuren dating should be discussed. Grouping data by unit from the 33 submitted samples provides a "dating success" rate for each unit. Only 2 out of 9 samples from Unit F had collagen problems (22.2%). Unit G had 16 out of 18 samples with either collagen problems or dates considered too young (88.9%). Unit H had four out of six samples with either collagen problems or too young dates (66.7%). Combined data for Units G and H are 20 out of 24 (83.3%).

Thus, while a few samples had collagen problems in Unit F, only a few samples were suitable for dating in Units G and H. It is thus clear that bone content was affected within Units G and H causing most of them to have problems with chemical content. Moreover, having a few Aurignacian-like dates between c. 30.5 and 28.0 ky BP for Units H and G that are the same as dates from stratigraphically higher Unit F (c. 30.9–29.4 ky BP for ungulate bone samples), it is proposed that the four Aurignacian-like dates c. 30.5–28.0 ky BP do not represent any true age either, being also too young as no Aurignacian-like dates exist between 22 and 13 ky BP.

Following this line of reasoning, we come to uncalibrated AMS dates in Europe for the Proto-Aurignacian with Dufour bladelets and the Late/Evolved Aurignacian with Roc de Combe bladelets (c. 37–36 to 34–33 ky BP and c. 32–28 ky BP, respectively), recalling that the Siuren I Aurignacian complexes entirely correspond to these two European Aurignacian industries (see artifact illustrations in Figs. 5 and 6 of the present author's "Siuren I rockshelter: From the Late Middle Paleolithic and Early Upper Paleolithic in Crimea" this volume). It is certain that the AMS dates from Siuren I Unit F absolutely correspond to the analogous European industry. However, the AMS dates from Units H and G do not fit into the European Proto-Aurignacian chronology. Given that they should correspond, the probability of problems with chemical content increases.

In sum, it is now seen that the existing AMS dates for Siuren I Units H and G are too young for their real uncalibrated C14 age, which should be older than 31 ky BP. Taking into consideration not only the AMS dates but also fauna and microfauna results (see in Demidenko et al. 2012), the following geochronology for the Siuren I Aurignacian complexes is proposed:

- Proto-Aurignacian and Micoquian: Stadial between Hengelo and Les Cottes/Huneborg Interstadials (Siuren I, Unit H) and Les Cottes/Huneborg Interstadial (Siuren I, Unit G);
- Late/Evolved Aurignacian: Arcy Interstadial (Siuren I, levels Fc and Fb1-Fb2 of Unit F) and Maisières Interstadial (levels Fa3 and Fa1-Fa2).

Siuren I Proto-Aurignacian can thus be connected with the European Proto-Aurignacian thorough chronological parameters.

Buran-Kaya III

The partially collapsed grotto was discovered by A.A. Yanevich in 1990 and has been investigated by him since then with colleagues from Ukraine, Japan, Belgium, the USA, and France.

The following sequence of Middle and Upper Paleolithic levels was established for the site in the 2000s (Chabai 2004; Chabai et al. 2004; Yanevich et al. 2009) with AMS dates obtained in the late 1990s at Oxford on ungulate bone samples and interstadial/stadial determinations based on pollen data (from bottom to top) (Fig. 1):

- Level E (archaeologically unclear, either Middle or Upper Paleolithic due to rarity of diagnostic artifacts) – Hengelo Interstadial, no absolute dates
- Level D (archaeologically unclear, Middle Paleolithic due to a few diagnostic artifacts) – Stadial after Hengelo, no absolute dates
- Level C ("Eastern Szeletian," EUP) – also Stadial after Hengelo, one date c. 36.7 ky BP and two dates c. 32.3 and 32.2 ky BP
- Layer B with lower level B1 and upper level B (Micoquian of Kiik-Koba type, LMP) – Arcy Interstadial, 2 dates c. 28.8 and 28.5 ky BP for level B1
- Levels 6–5, 6–4, and 6–3 (Late Aurignacian, according to Yanevich, or Gravettian, according to Otte and Noiret) – Stadial of Late Pleniglacial c. 27–18 ky BP but with inconsistent order of dates: level 6–5 – c. 34.4 and 28.7 ky BP; level 6–4 – c. 11.9 ky BP; and level 6–3 – c. 11.9 ky BP
- Levels 6–2, 6–1 and 5–2 (Epigravettian) – Stadials of Late Pleniglacial for levels 6–2 and 5–2 and upper part of level 6–1, and Lascaux Interstadial of Late Pleniglacial for lower part of level 6–1 c. 18–13 ky BP, but with a single date c. 30.7 ky BP for level 6–2 only

This archaeological sequence at Buran-Kaya III has been interpreted as follows by Chabai. The lower part of the sequence (levels E through B), with a total thickness of c. 1 m in the inner part of the grotto close to the drip-line, is considered to be correctly archaeologically and geochronologically attributed. The upper part of the sequence (levels 6–5 through 5–2), c. 0.7 m thick, with Epigravettian levels at the top, is considered as having been deposited very slowly, especially adding levels C and B. The "mess" with the AMS dates for levels 6–5 to 6–2 has been explained both by slope sediments near the grotto's drip-line and horizontal "artificial level" excavations of levels 6–5 to 5–2 by Yanevich in the 1990s, such that incorrect bone samples were selected for AMS dating due to possible mixing of layers. There is now general agreement among colleagues on Chabai's interpretation for the Buran-Kaya III Middle and Upper Paleolithic industrial-chronological sequence.

Yanevich also grouped materials from levels 6–2 and 6–1 (level 5–2 was not always mentioned by him as Epigravettian– see Yanevich 2000, but see Yanevich et al. 2009) (Fig. 2), Siuren I 1920s upper layer and Adzhi-Koba, 1920s upper layer materials into the "Buran-Kaya culture of Crimean Gravettian," or Epigravettian (Yanevich 2000). Moreover, the Epigravettian culture had its origin within Buran-Kaya III, levels 6–5 to 6–3, which contain Aurignacian materials with micro-Gravette points already present. The materials from Buran-Kaya III, levels 6–5 to 6–1/5–2 were of crucial importance for the Crimean Paleolithic for Yanevich. Yanevich's Epigravettian attribution was accepted by the author, as well as Ukrainian and American colleagues, for levels 6–2 and 6–1, although the absence of microliths with thick backed lateral edge was notable, considering, at the same time, levels 6–5 to 6–3 as belonging to the same Epigravettian industry. The differences between the two sets of levels were explained by a rather sparse number of artifacts in the lower sublevels of level 6 as due to ephemeral human occupations, while upper sublevels of level 6 were certainly remains of intensive short-term human occupations with numerous finds (Demidenko 2003).

The Buran-Kaya III Epigravettian became more important and enigmatic when a new series

Crimean Late Middle Paleolithic to Early Upper Paleolithic Transition, Fig. 1 Buran-Kaya III. Combined stratigraphy for Middle and Upper Paleolithic levels. ((**a**) After Chabai 2004; Yanevich et al. 2009; (**b**) After Prat et al. 2011)

Crimean Late Middle Paleolithic to Early Upper Paleolithic Transition, Fig. 2 Buran-Kaya III, level 6–1. Flint artifacts. (After Prat et al. 2011)

of four AMS uncalibrated dates on three ungulate bones and a human parietal fragment after well-controlled excavations in 2001 were obtained at the Groningen and Gif-sur-Yvette labs for levels 6–2 (c. 34 and 34.9 ky BP) and 6–1 (c. 31.3 and 31.9 ky BP), although the levels were still considered as belonging to the "Gravettian tradition" (Prat et al. 2011) (Fig. 1b). The new dates, however, certainly call for revision of the previous interpretation for the site's sequence from level C to level 6–1/5–2 since they are either identical or even older than the dates obtained in the 1990s for underlying levels C and B.

The present author proposes a new interpretation of the level C to level 6–1/5–2 sequence based on additional and/or reconsidered data.

1. *Archaeological data*. The archaeological attribution of levels 6–5 through 6–1/5–2 needs to be discussed. Given the near absence or minor role of true backed bladelets and the dominance of finely retouched microblades with not only lateral, but often bilateral, dorsal retouch (Yanevich et al. 2009; Prat et al. 2011), it appears clear that assemblages from these levels do not belong to either Gravettian or Epigravettian. New AMS dates of c. 31 and 35 ky BP cannot represent any Gravettian tradition *sensu lato*. The levels are also not Aurignacian. This industry is thus not comparable to any Upper Paleolithic industry in either Crimea or Eastern Europe. The present author's search for comparable EUP assemblages, however, identified a very similar industry in Northwestern Caucasus (Mezmaiskaya Cave, levels 1C, 1B, and 1A, AMS dates between 33 and 28 ky uncal BP) (Fig. 3) and Southern Caucasus (Dzudzuana cave, layer D, AMS dates between 32 and 27 ky uncal BP; Ortvala Klde rockshelter, layers 4d and 4c, AMS dates between c. 38–34 and 30 ky uncal BP) (Meshveliani et al. 2004; Golovanova et al. 2006, 2010a, b; Adler et al. 2008). In addition to similarities between the lithic assemblages, the EUP materials of the four sites (especially from Buran-Kaya III and Mezmaiskaya) also include numerous bone tools (points and awls) (Figs. 4 and 5) and personal ornaments (perforated shells, mammal teeth, and even mammoth ivory beads) (Figs. 6 and 7). Thus, the proposed origin of the Buran-Kaya III EUP industry is in Southern Caucasus via Northwestern Caucasus.

In addition, based on the pollen data for Buran-Kaya III, it is now possible to suggest the Arcy Interstadial for level 6–1 and the Huneborg Stadial for levels 6–2 to 6–5 at Buran-Kaya III.

2. *The 1990s uncalibrated AMS dates*. With new AMS dates for levels 6–1 and 6–2, the 1990s AMS dates can now be reevalauted. The 1990s dates for level 6–5 (c. 34.4 and 28.7 ky uncal BP) are analogous to both the 1990s dates for levels C and B1 and the new dates for levels 6–1 and 6–2. The two 1990s dates for levels 6–4 and 6–3 (c. 11.9 ky BP) relate to level 5–1 of the Final Paleolithic Shan-Koba occupation at the site and certainly indicate slope deposition processes near the grotto's drip-line where the Final Paleolithic bone samples were recovered during horizontal excavations, being at levels 6–4 and 6–3 "pseudo-elevation" there. Finally, the single 1990s date for levels 6–2 to 5–2, c. 30.7 ky BP for level 6–2, is not different from new dates between c. 31 and 35 ky BP for levels 6–1 and 6–2. As a result, the new look at the 1990s dates, instead of rejecting all of them, indicates a series of not ordered dates between c. 36 and 28 ky BP for all Middle and Upper Paleolithic levels C through 6–1 at Buran-Kaya III.
3. *Interfacing of the 1990s and 2011 uncalibrated AMS dates and new interpretation for the Buran-Kaya III LMP and EUP sequence*. Some younger C14 ages for the 1990s levels B1 and C dates in comparison to the 2011 dates for level 6–2 and/or 6–1 can be due to the following reasons. First, the 1990s dates in Oxford were obtained without the ultrafiltration protocol for bone samples from Buran-Kaya III, making them younger in comparison to the new dates. Second, the younger age of 28 ky BP for level B1 may be similar to the situation for Siuren I, Units H and G where collagen problems played a crucial role. The

Crimean Late Middle Paleolithic to Early Upper Paleolithic Transition, Fig. 3 Mezmaiskaya cave, level 1C. Flint artifacts. (After Golovanova et al. 2010b)

Crimean Late Middle Paleolithic to Early Upper Paleolithic Transition, Fig. 4 Buran-Kaya III, levels 5–2, 6–1, and 6–2. Bone tools. (After Yanevich et al. 2009)

Micoquian layer B may actually be older than 30 ky BP and would fit well between the extreme dates for level C (c. 36.7 ky BP) and levels 6–2 and 6–1 (c. 31 ky BP). The same also relates to the date of c. 28.7 ky BP for level 6–5, while the date of c. 34.4 ky BP for the same level could be close to its real age. Thus, the entire LMP and EUP sequence from level C to level 6–1/5–2 (an overall thickness c. 1 m), dated to around c. 36–31 ky BP, can be characterized by a high deposition rate, contrary to the previously proposed low sedimentation rate.

Using the 2004 pollen data, the following order for the Buran-Kaya III sequence can be proposed: level C, Stadial after Hengelo Interstadial; layer B, Les Cottes/Huneborg Interstadial; and levels 6–5 to 6–2, Huneborg Stadial and Arcy Interstadial for level 6–1.

The EUP sequence rapidly ends with a hiatus between levels 5–2 and 5–1 as the latter level is attributed to the Final Paleolithic Shan-Koba with two uncalibrated C14 dates from the Kiev lab, c. 11.4 and 10.9 ky BP (Allerød Interstadial), followed then by another Final Paleolithic, but this time Swiderian occupation in level 4 with

Crimean Late Middle Paleolithic to Early Upper Paleolithic Transition,
Fig. 5 Mezmaiskaya cave, levels 1C, 1B, and 1A. Bone tools. (After Golovanova et al. 2010a)

two uncalibrated C14 dates from the Kiev lab, c. 10.7 and 10.5 ky BP (Younger Dryas).

Mezmaiskaya Cave

Recently published new AMS dates from different labs for the LMP (Micoquian) layers and Upper Paleolithic layers at Mezmaiskaya Cave, complemented by pollen data (Golovanova et al. 2006, 2010a, b; Pinhasi et al. 2011), also allow the present author to reconsider the previous position of our Crimean team (Chabai 2004; Demidenko 2008) on this cave's sequence, in which the Huneborg Stadial (c. 36–32 ky BP) was proposed for the LMP layers and rejection of EUP status for levels 1C to 1A. Now, as shown above, the assemblages from levels 1C to 1A (c. 33–28 ky BP) are acknowledged as belonging to the South Caucasus EUP industry, along with Buran-Kaya III, levels 6–5 to 6–1/5–2. Below archaeologically sterile level 1D, the youngest LMP level 2 is dated between c. 44–36 ky BP, including an AMS date of c. 39.7 ky BP for a bone from the Mezmaiskaya 2 human infant. Accordingly, the last LMP occupations at Mezmaiskaya Cave occurred c. 36 ky BP or c. 39 ky calibrated BP. From the Crimean geochronological positions, it is also possible to propose relating Mezmaiskaya EUP to Huneborg Stadial (levels

Crimean Late Middle Paleolithic to Early Upper Paleolithic Transition, Fig. 6 Buran-Kaya III, levels 6–1 and 6–2. Personal ornaments. (After Yanevich et al. 2009)

1C-1B) and Arcy Interstadial (1A), while the cave's LMP seems to be no younger than the Les Cottes/Huneborg Interstadial.

New Geochronological Suggestions for the LMP-EUP Transition

In comparison to the 2000s proposal, the two key Crimean sites with both LMP and EUP components (Buran-Kaya III and Siuren I), keeping also in mind similar data for Mezmaiskaya Cave in Northwestern Caucasus, make older the geochronological borders for the Aurignacian and newly defined EUP complexes and the upper geochronological border of LMP in Crimea.

Taking solely data from the two Crimean sites, the EUP geochronology can be viewed as follows:

- "Eastern Szeletian" (Buran-Kaya III, level C): Stadial between Hengelo and Les Cottes/Huneborg Interstadials
- Proto-Aurignacian: Stadial between Hengelo and Les Cottes/Huneborg Interstadials (Siuren I, Unit H) and Les Cottes/Huneborg Interstadial (Siuren I, Unit G)
- EUP industry of Southern Caucasus (Buran-Kaya III, levels 6–5 to 6–1/5–2): Huneborg Stadial (Buran-Kaya III, levels 6–5 to 6–2) and Arcy Interstadial (Buran-Kaya III, levels 6–1 to 5–2)
- Late/Evolved Aurignacian: Arcy Interstadial (Siuren I, levels Fc and Fb1-Fb2 of Unit F) and Maisières Interstadial (levels Fa3 and Fa1-Fa2)

The LMP (Micoquian of Kiik-Koba type) levels and/or separate finds at the two sites can be geochronologically connected to the Stadial between the Hengelo and Les Cottes/Huneborg Interstadials (Siuren I, Unit H) and the Les Cottes/Huneborg Interstadial (Siuren I, Unit G; Buran-Kaya III, layer B).

Following the EUP and LMP geochronology for Buran-Kaya III and Siuren I, it can be seen that the Late Micoquian can be no younger than the Les Cottes/Huneborg Interstadial (c. 36 ky BP), coexisting with both "Eastern Szeletian" and Proto-Aurignacian industries, while the EUP industry of the Southern Caucasus and the Late/Evolved Aurignacian did not coexist with the Micoquian. The latter possible situation corresponds well to the Northwestern Caucasus Mezmaiskaya Cave sequence in which the Micoquian sequence seems end during the Les Cottes/Huneborg Interstadial.

If the new geochronological version for the LMP-EUP interface at two key Crimean sites for the transitional period is correct, then the 2000s concept should be significantly altered. First, both "Eastern Szeletian" and Proto-Aurignacian appeared in Crimea at about the same time and there is even a possibility that Proto-Aurignacian groups of Siuren I, Unit H came to Crimea before the Szeletians. Second, Late Micoquian Neanderthals coexisted with unknown, yet Szeletian, humans, and Proto-Aurignacian *Homo sapiens* and people of the three industries did not survive in western (Siuren I) and eastern (Buran-Kaya III) Crimea until the appearance of the Late/Evolved Aurignacian and the EUP industry of Southern Caucasus.

Crimean Late Middle Paleolithic to Early Upper Paleolithic Transition,
Fig. 7 Mezmaiskaya cave, levels 1C, 1B, and 1A. Bone tools. (After Golovanova et al. 2010a)

At the same time, no archaeological level at the two sites contained Levallois-Mousterian, also absent in Northern Caucasus, which is why their persistence in Crimea during the subsequent Huneborg Stadial and Arcy Interstadial cannot be excluded, according to the 2000s concept. On the other hand, the 2000s concept suggesting the presence of Late Micoquian Neanderthals at other Crimean sites during the Huneborg Stadial and Arcy Interstadial should be verified. The indicative case with Siuren I, Units H and G AMS dating with too young results c. 31–28 ky BP because of collagen problems may also occur at other Crimean sites that have been dated by AMS.

For example, the geochronological position of the Kiik-Koba, Micoquian upper layer was proposed on the basis of lithological and pollen data to be related to either the Stadial between the Moershoofd and Hengelo Interstadials or to the Stadial preceding the Arcy Interstadial (Demidenko 2004). A C14 date of c. 32.3 ky BP obtained on an ungulate bone by the Kiev lab served to support the late variant of the proposed geochronology – Huneborg Stadial (Demidenko 2008). But the new Oxford AMS-dating attempt casts some doubts on this. Within the frame of the 2000s reanalyses of the Kiik-Koba materials, two ungulate bones were selected for AMS dating. One sample failed. The second was of *Bos/Bison* and dated to c. 25.7 ky BP (with $\delta 13C = -20.1$). The determination was <1% wt. collagen, which is below the usual threshold (comment to Th. Uthmeier from D. Baker 27.02.2007). This, and the fact that the first sample failed, strongly suggests that this very young date be treated with caution, as well as the c. 32.3 ky BP date, given

the lack of information on the bone sample characteristics from the Kiev lab.

All in all, new data from the 2010s and new considerations have "opened the door" for a new geochronology and industrial structure for LMP-EUP transition, although further work is needed.

Crimean Middle Paleolithic

Yuri E. Demidenko
Crimean Branch, Institute of Archaeology, National Ukrainian Academy of Sciences, Simferopol, Crimea, Ukraine

Introduction

Geographical Setting

The Crimean peninsula (Fig. 1) is located in the southeastern corner of the European continent, on the northern coast of the Black Sea in southern Ukraine. Moreover, except during the Last Interglacial period (c. 128–116 year BP, MIS 5e) when Crimea was an island, present-day Crimea was not a peninsula but rather the southernmost edge of a continuous land belt from the Eastern Balkans to Northwestern Caucasus in Eastern Europe during most of the Upper Pleistocene. Occupying such a transitional geographical position between different European and Asian regions, Crimea is quite important for Western Eurasian Paleolithic studies.

Crimea, (see Ferring in Marks and Chabai 1998), 300 km wide and 180 km from north to south with a total area of about 26,000 km^2 centered on 45° N, 34° 30′ E, is subdivided into two main regions by its physiography. The steppe is located in the north and the mountainous areas in the south. All of the known in situ Paleolithic sites are situated in the latter. The Crimean Mountains, with three ridges, stretches 160 km west–east and 50 km north–south. The ridges are composed of limestone, sandstone, sedimentary rock, chalk, marl, and conglomerates, often added including karstic terrain. A number of natural sheltered places (caves/grottos/rockshelters) and primary

Crimean Middle Paleolithic, Fig. 1 Map of the Crimea with Middle Paleolithic site locations. (Map prepared by Dr. G. Bataille, Cologne University)

and secondary high-quality flint outcrops are known along various cuestas and cliffs. These two key components for the survival Paleolithic human groups certainly attracted them to this region. In addition, it was possible to hunt different ungulates (*Equus hidruntinus*, *Saiga tatarica*, *Bovinae*) near steppe plateaus located above limestone cuestas and cliffs adjacent to river valleys. Such resources made the Crimean mountainous region indeed an attractive region for occupation over the last 100,000 years, by different hominin groups with different cultures and industries, some of whom stayed for a long time, while others simply passed through the region during long distance migrations.

At the same time, the majority of Crimea, its northern steppe zone, from a geological point of view, usually features many-meter-thick loess deposits with no rocky cuestas or cliffs with caves/grottos/rockshelters. Only a few archaeological surveys have been attempted to find Paleolithic sites in this region, but very few Mesolithic and Neolithic sites have been found in Holocene deposits and not a single Paleolithic site. Systematic survey is needed for to discover open-air Paleolithic sites in the Crimean steppe region. Before such sites are found, present knowledge of the Crimean Paleolithic is based only on in situ sites in the southern mountainous region, which while important, is still but a part of the entire Crimean territory. Future discoveries of sites in both the northern steppe zone and the southernmost sea coastal shore, zones lacking high-quality flint outcrops, in addition to the very few surface flint artifacts found, will make the picture of Crimea and its Middle Paleolithic much more mosaic.

Historical Background

History of Middle Paleolithic Studies in the Crimea

Another Paleolithic feature of the Crimea should be noted. Despite some suggestions for the presence of the Acheulian or Lower Paleolithic in Crimea, there are neither in situ sites nor clearly identifiable artifacts for such industries as yet (Chabai et al. 2000). The oldest Crimean Paleolithic is therefore represented by the Middle Paleolithic, the subject of this entry.

The first Middle Paleolithic site (Volchiy Grotto, eastern Crimea) and surface flints (Kabazi Mountain, western Crimea) were discovered by the pioneer of Crimean Paleolithic archaeology, Konstantin S. Merejkowski (St. Petersburg) in 1879–1880. These Middle Paleolithic finds in the Crimea were also the first for the entire Russian Empire at that time. These important discoveries, however, were not followed up and actually forgotten, despite the fact that G. de Mortillet (France), the most authorized Paleolithic Age archaeologist in the last quarter of the nineteenth century, confirmed the Mousterian Age of the Volchiy Grotto finds in 1900. Only with the real rediscovery of the Crimean Paleolithic by Gleb A. Bonch-Osmolowski (Leningrad) during fieldwork from 1924 to 1932 was Crimea recognized as a region rich in Paleolithic sites in Eastern Europe. Bonch-Osmolowski excavated three Middle Paleolithic sites in Crimea in the 1920s: Kiik-Koba grotto with two Neanderthal burials, Shaitan-Koba grotto and Adzhi-Koba cave. The Kiik-Koba deposits contained two Paleolithic layers, the lower of which was considered to be "*an amorphous stage of the Pre-Chelleen*," also comparable to the "*Old Clactonian*," "*Tayacien*," and the upper "*Late Micoquian*" connected to "*the end of the Acheulian or . . .to the transition from Acheulian to Mousterian*" (Bonch-Osmolowski 1940). The lower layer of Adzhi-Koba was similar to the upper layer of Kiik-Koba "*Late Micoquian*" artifacts, but the lithic assemblage was limited (Bonch-Osmolowski 1940). These two sites, with assemblages characterized by a near absence of core reduction and the presence of bifacial "plano-convex" tool production, a term introduced by Bonch-Osmolowski, were the first Paleolithic sites for both Middle and Upper Paleolithic (the upper layer at Adzhi-Koba contained, in modern Paleolithic terms, an Epigravettian assemblage) in the first ridge areas of Crimean Mountains in eastern Crimea. Shaitain-Koba grotto with

two Middle Paleolithic layers, on the other hand, was characterized by many Levallois and blade cores and very rare bifacial tools. The Shaitan-Koba assemblages were considered to be "*Late Mousterian*," perhaps even transitional to the Upper Paleolithic (Bonch-Osmolowski 1940). Two other "*Late Micoquian*" assemblages were excavated in the 1930s by O.N. Bader (Moscow) at Volchiy Grotto and N.L. Ernst (Simferopol, Crimea) at Chokurcha cave. On the basis of these Crimean Middle Paleolithic sites, Bonch-Osmolowski (1940) laid the foundations of Crimean Middle Paleolithic studies, proposing a unilinear Middle Paleolithic evolutionary sequence in Crimea containing the amorphous "*Pre-Chelleen*," "*Late Micoquian*," and "*Late Mousterian*" stages.

Moreover, looking at this database today, we clearly see that assemblages from all three of the now defined Middle Paleolithic industries in Crimea were already known in the 1930s: Denticulate Mousterian of Kiik-Koba, lower layer; Crimean Micoquian Tradition with bifacial "plano-convex" tools; and Western Crimean Mousterian/Levallois-Mousterian. The latter two industries were supplemented in the late 1930s and the 1950s by new assemblages from sites excavated by D.A. Krainov and A.A. Formozov (Moscow): Bakchisaraiskaya, Kholodnaya Balka grotto, Kabazi I buried grotto, and Starosele. Here it should be noted that the 1950s marks the end of systematic Crimean Paleolithic fieldwork by Russian archaeologists from Leningrad and Moscow because in February 1954 Crimea passed from Russia to Ukraine. Subsequently, Ukrainian archaeologists were actively involved in Crimean Paleolithic studies.

Yuri G. Kolosov (Kiev) was the leader of Crimean Paleolithic archaeology studies from the 1960s to the early 1990s. Regarding the Middle Paleolithic, he discovered and excavated Prolom I and II grottos and, most importantly, several buried rockshelters at Ak-Kaya and Zaskalnaya and the open-air site of Krasnaya Balka in Red Valley behind the Ak-Kaya Cretaceous and Eocene limestone and marl rocky massif, more than 100 m above the surrounding steppe areas in eastern Crimea. Excavations of Zaskalnaya V and VI multilevel buried rock-shelters led to the recovery of abundant flint assemblages, fauna, and even Neanderthal remains. Moreover, several repeated and probably chronologically successive collective child burials with eight individuals in layers III and IIIa at Zaskalnaya VI were found. On the basis of Zaskalnaya, Kolosov identified another Mousterian culture with bifacial tools – Ak-Kaya – in addition to the Kiik-Koba, upper layer and Starosele cultures. In the mid-1980s, Kolosov began new excavations in western Crimea and several new important Middle Paleolithic sites were found (notably among them, Kabazi II and Kabazi V) (Kolosov et al. 1993).

New and ongoing fieldwork for the Crimean Middle Paleolithic was initiated in 1992 after the collapse of the Soviet Union, when it became possible to collaborate with Western colleagues. Such studies in Crimea were realized by Crimean archaeologists headed by Victor P. Chabai (Kiev-Simferopol, one of Kolosov's students) with archaeologists from the USA (A.E. Marks), Belgium (M. Otte) and Germany (J. Richter and Th. Uthmeier) and their associates and students, as well as many natural science specialists from Ukraine, Russia, Moldova, the USA, Canada, France, and England. Between 1993 and 2006, these groups of researchers excavated the following stratified Middle Paleolithic sites and multi-period Paleolithic and/or prehistoric sites with Middle Paleolithic level(s), both already known and newly discovered: Kabazi II, Kabazi V, Starosele, Siuren I, Chokurcha I, Buran-Kaya III, Karabi Tamchin, Karabai I, Sary-Kaya I, and Karabai II. The analysis of new materials from these ten sites and reanalysis of old collections, a great number of articles, and eleven books have been published (Marks and Chabai 1998; Chabai and Monigal 1999; Chabai et al. 2000, 2004, 2005, 2006, 2007, 2008; Chabai 2004; Demidenko 2004; Demidenko et al. 2012), plus two more volumes in press. These present the results from new approaches, multi-complex studies and absolute dates for the Crimean Middle Paleolithic.

Key Issues/Current Debates

Geochronology of the Crimean Middle Paleolithic

Prior to the collapse of Soviet Union, no absolute dates had been obtained for the Crimean Middle Paleolithic, excluding two radiocarbon dates older than 45,000 BP for Zaskalnaya VI, layer II (Kiev lab), and older than 50,000 BP for Zaskalnaya V, layer II (Novosibirsk lab), and attempts to obtain U-series dates for Kabazi I (31–33,000 BP) and Starosele (31,000 BP, 41,000 BP, and 110,000 BP) by the founder of the method, V.V. Cherdyntsev in the late 1950s. Pollen data was analyzed only for sediments at Kiik-Koba in the 1960s and Zaskanaya V in the 1980s. Geological studies were very general and did not allow specialists to propose real internal sediment geochronology for the Crimean sites, or such proposals were completely wrong, such as the Last Glacial Maximum for the Proto-Aurignacian/Micoquian of Kiik-Koba-type industry and the Evolved Aurignacian at Siuren I.

The situation for determining Middle Paleolithic geochronology in Crimea has changed dramatically over the last two decades. Well more than 100 absolute dates using AMS/C14, ESR, U-series and TL-dating methods have been obtained. Geological, pollen, fauna, small mammal, and malacofauna studies have also added significant results for determination of Crimean Middle Paleolithic and Early Upper Paleolithic geochronology. All such geochronological data were analyzed and synthesized by Chabai in the mid-2000s and the most recent version (Chabai et al. 2008) is presented in Table 1. The three Crimean Middle Paleolithic industries are viewed as only geochronologically dated to the Upper Pleistocene: MIS 5–3, c. 120–30,000 BP. The Denticulate Mousterian in the Kiik-Koba, lower layer is dated only to the Lower Pleniglacial/MIS 4 (c. 70–60,000 BP) on the basis of geochronological data from Starosele, particularly level 3. The only Middle Paleolithic industry that covers the whole period between c. 120 and 30,000 BP is the Crimean Micoquian Tradition with three industry types–Ak-Kaya, Starosele, and Kiik-Koba. Moreover, not counting the possibly brief "Denticulate Mousterian episode" during the Lower Pleniglacial in Crimea, the Micoquian, beginning in the Last Interglacial and ending during the Hosselo Stadial before the Hengelo Interstadial, was the only representative of Middle Paleolithic industries in Crimea. It was only around 45,000 BP, during the Hosselo Stadial that, in addition to the Micoquian, the Levallois-Mousterian appeared in Crimea. Both of these industries apparently survived until the Denekamp Interstadial (c. 30–28,000 BP) when Early Upper Paleolithic industries appeared in Crimea.

New dating results and/or industrial attributions for the EUP industries at Siuren I and Buran-Kaya III allow the present author to propose an older time period for the last Middle Paleolithic industries in Crimea (see the entry on "▶ Crimean Late Middle Paleolithic to Early Upper Paleolithic Transition" in this encyclopedia).

Crimean Middle Paleolithic Industrial Variability

The presence of three Middle Paleolithic industries in Crimea – Denticulate Mousterian, Micoquian, and Levallois-Mousterian – has been addressed through the application of two different approaches: cultural and noncultural. In general, the Denticulate Mousterian and Levallois-Mousterian and their very basic interpretations do not vary much between the two approaches. However, interpretations of the Micoquian industry are too different, depending on the approach, and will be discussed below.

The *Crimean Denticulate Mousterian* (Kiik-Koba grotto, lower layer and Starosele site, level 3) can be described as follows (Demidenko 2003–2004; see also artifact illustrations in Fig. 2 of Demidenko's entry on "▶ Kiik-Koba Grotto: Significance for Paleolithic Studies in East Europe and the Former Soviet Union", and in Fig. 3 of Demidenko's entry on "▶ Starosele Middle Paleolithic Site with Hominin Remains" in this encyclopedia. Technologically, primary flaking processes are based on reduction of both unsystematic globular multiplatform and primitive parallel single-platform cores with transverse, shortened metric proportions, with almost no striking platform preparation. Most of the

products are small shortened pieces with massive thick butts usually with a very pronounced cone and bulb indicating hard hammer percussion. Blades are fairly uncommon and are usually, like most of the flakes, very irregular in shape and dorsal scar patterns, indicating their removal from the same cores with no specific blade production. The tool kit is characterized by the absence of bifacial tools, dominance (more than half of all formal tools) of both pieces with

marginal and/or irregular retouch and denticulates and notched pieces, and a very low representation of points. The very minor presence of convergent forms among side-scrapers, a combination of simple side-scrapers with either retouched notched pieces or "Clactonian" ones, and the presence of side-scrapers and denticulates with ventral and/or alternate retouch are also worth noting. Many denticulates and notched pieces are set apart by one feature: a "Clactonian notch" was first created and then a single-blow notch was additionally retouched. Very specific is the occurrence of "combined tools" as side-scrapers + denticulates-notches and end-scrapers or perforators + denticulates-notches. Since the 1970s (Gladilin 1976), similarities between the Kiik-Koba lower layer assemblage and "Tayacian" complexes in Moldova have been noted. Such a relationship is still considered as probable (Demidenko 2003–2004).

The *Crimean Levallois-Mousterian*, often also termed the Western Crimean Mousterian after the location of its most typical assemblages in that part of Crimea, is best represented by finds from Kabazi II, Units II and IIA; Kabazi V, Subunit III/3 and Unit IV; Karabi Tamchin, layers II/2 and III; and Shaitan-Koba grotto (see in Marks and Chabai 1998; Chabai 2004; Chabai et al. 2008). According to Chabai, the Crimean Levallois-Mousterian is subdivided into two stages – early (Hosselo Stadial-Huneborg Interstadial) and late (Huneborg Stadial-Denekamp Interstadial) – based on technological changes through time. The stages are best represented by assemblages from Kabazi II, the key Middle Paleolithic site for Eastern Europe as a whole, where the early stage is represented by levels IIA/2 to II/7 and the late stage by levels II/6 to II/1A. The early stage features technological coexistence of Levallois reduction with finely prepared main and lateral supplementary core striking platforms (Fig. 2: 1–3), and parallel volumetric method (Fig. 2: 4–5), while the late stage is characterized only by the parallel volumetric method. The early stage assemblages thus contain both Levallois and laminar products, and the late stage shows a dominance of blades. Blades commonly form a high percentage in both stages (15–35% within debitage products). Typologically, both early and late stages of the Levallois-Mousterian are rather similar given the absence of bifacial tools and dominance of simple (Fig. 3: 1–3) and double (Fig. 3: 4–6) side-scrapers (together they generally account for more than 50% of formal tools) and about equal percentages of convergent side-scrapers and points (Fig. 3: 7–8) most of which were produced on elongated flakes and blades. The only significant typological difference between the two stages is the presence of obliquely backed blades (Fig. 3: 9–10). At the same time, the technological evolution of Levallois-Mousterian almost toward the Upper Paleolithic reduction method was not accompanied by typological changes, such that Upper Paleolithic tool types did not appear during the late stage of the Levallois-Mousterian in Crimea (Chabai 2004). Thus, the Crimean Levallois-Mousterian did not evolve into a typologically Initial Upper Paleolithic industry but remained in the framework of the Middle Paleolithic.

Yu.G. Kolosov (1972), after studies of Bonch-Osmolowski's 1920s materials from Shaitan-Koba, suggested movement of Levallois-Mousterian groups from the Balkans into Crimea. Today, the commonly accepted hypothesis is to see the appearance of Levallois-Mousterian groups in Crimea as a result of migration from the Dniester River region in Western Ukraine and Moldova (Molodova I & V sites, Buteshty grotto) (Chabai 2004; see in Chabai et al. 2006). Recently, significant technological similarities have been shown between the latest Levantine Mousterian assemblages in the Near East and early stage assemblages of the Crimean Levallois-Mousterian (Demidenko 2011). Moreover, the timing of the disappearance of latest Levantine Mousterian assemblages in the Near East fully coincides with the appearance of the first Levallois-Mousterian assemblages in Crimea around 45,000 BP. Kolosov's (early 1970s) hypothesis of a Balkan origin thus deserves more attention and reexamination, keeping in mind the possibility for Near Eastern Latest Neanderthal migrations to the south of Eastern Europe via the Balkans.

Crimean Middle Paleolithic, Fig. 2 Crimean Levallois-Mousterian/Western Crimean Mousterian industry from Unit II of Kabazi II site. Flint artifacts: *1* Levallois core; *2–3* bidirectional cores with finely prepared striking platforms; *4–5* cores of parallel volumetric method. (Modified after Chabai 2004).

The *Crimean Micoquian* assemblages, or Middle Paleolithic assemblages with bifacial "plano-convex" tools, are the most well-known Crimean Middle Paleolithic industry for both ex-Soviet Union and foreign Paleolithic archaeologists. Their fame is connected to both abundant tools including nicely produced bifacial ones and Neanderthal bone remains found at Kiik-Koba grotto, Zaskalnaya VI buried rockshelter, and below Zaskalnaya V buried rockshelter. The cultural approach was first applied to Crimean Middle Paleolithic assemblages with bifacial tools in the 1970s by V.N. Gladilin (1976). After all the Middle Paleolithic culture identifications in Crimea in the 1970s–1980s, three cultures with bifacial tools were identified: Ak-Kaya (sites of Ak-Kaya III; Zaskalnaya III, V, and VI; Sary-Kaya I; Krasnaya Balka; Prolom II), Kiik-Koba (Kiik-Koba, upper

Crimean Middle Paleolithic, Fig. 3 Crimean Levallois-Mousterian/Western Crimean Mousterian industry from Unit II of Kabazi II site. Flint artifacts: *1–2* simple lateral side-scrapers on Levallois flakes; *3* simple lateral side-scraper on a blade; *4*, *6* double side-scrapers on blades; *5* double side-scrapers, bi-truncated faceted; *7–8* points; *9–10* obliquely backed blades. layer; Prolom I), and Starosele (Starosele, the 1950s excavation finds; Kabazi V, 1980s Units I–III; GABO, Kabazi II, the 1980s excavation Units I and III) (Kolosov et al. 1993). The three cultures are technologically similar with use of a combination of radial, discoidal, multiplatform, and parallel reduction techniques but no Levallois methods, and no careful main and/or lateral supplementary core platform preparation. Faceting indices are thus either low or medium, less than 45% for the IFl index and less than 30% for the IFst index. Blade indices are also not particularly high, varying between 5% and 20%, with the highest rates for the Starosele culture, in which, however, blades are mainly the result of bifacial tool reduction. There are some typological differences between the three cultures. The Ak-Kaya industry type/culture contains a high percentage of bifacial tools (c. 20–30%) with many and various so-called backed knives, a medium range of convergent types among unifacial tools, mainly side-scrapers, relatively rare points among

Crimean Middle Paleolithic,
Fig. 4 Crimean Micoquian Tradition industry of Ak-Kaya type. Flint artifacts: *1* bifacial leaf point; *2* bifacial side-scraper. *1–2* Zaskalnaya V buried rockshelter. (Modified after Chabai 2004).

unifacial tools, and a considerable number of simple side-scraper types (from c. 40%) (Figs. 4, 5, 6 and 7). The Kiik-Koba industry type/culture shows a medium amount of bifacial tools (around 15%) with a rarity of backed knives among them, an abundance of points among unifacial (c. 40%) and bifacial (c. 50%) tools, a rather low frequency of simple side-scraper types (c. 20–30%) among unifacial tools, as well as mostly small (less than 5 cm long) bifacial and unifacial tools; this industry is often related to the Micro-Mousterian (see artifact illustrations in Fig. 3 of Demidenko's entry on ▶ Kiik-Koba Grotto: Significance for Paleolithic Studies in East Europe and the Former Soviet Union). The Starosele industry type/culture was thought to be distinguished by a low presence of bifacial tools (c. 5–10%) with the almost exclusive occurrence of leaf-shaped and crescent points among them, a medium to high frequency of points (c. 20%) and convergent side-scrapers (c. 40%) within unifacial tools, while simple side-scraper types are

Crimean Middle Paleolithic, Fig. 5 Crimean Micoquian Tradition industry of Ak-Kaya type. Flint artifacts: 1–2 bifacial semi- and sub-crescent points; 3 bifacial leaf point; 4 subtriangular point; 5 semi-trapezoidal point. 1, 3–5 Chokurcha I site; 2 Zaskalnaya V buried rockshelter. (Modified after Chabai 2004).

subordinate (see artifact illustrations in Fig. 4 of Demidenko's entry on ▶ Starosele Middle Paleolithic Site with Hominin Remains). So-called Upper Paleolithic tools and denticulates/notches occur irregularly in insignificant numbers in these industry types. So, the typological variations for the three industries served to isolate the three distinct Middle Paleolithic cultures in the Crimea and are still in use by some East European colleagues.

However, when the new stage of Crimean Paleolithic studies began in the early 1990s, the basic typological uniqueness of the three cultures together was well established; when one ignores differences in typological indices, the cultures all have principally the same tool types. After a complex synthesis of various anthropogenic and natural factors to understand and interpret the sites, all Crimean Middle Paleolithic industries with bifacial tools are now considered within the

Crimean Middle Paleolithic,
Fig. 6 Crimean Micoquian Tradition industry of Ak-Kaya type. Flint artifacts: *1–5* bifacial side-scrapers; *6* transversal oblique side-scraper; *7*, *9* double side-scrapers; 8 transversal side-scraper (*6–9* side-scrapers on bifacial tool debitage pieces). *1–4* Zaskalnaya V buried rockshelter; *5*, *7–9* Chokurcha I site; *6* Kabazi II site. (Modified after Chabai 2004).

framework of the Crimean Micoquian Tradition (Chabai et al. 2000). The tradition envelopes the three known industries (Ak-Kaya "*étalon* like," Kiik-Koba, and Starosele) through a "uniformity in diversity" methodological approach. Along with this, the industrial variability of the Crimean Micoquian Tradition is not limited to these three industry types. At least two more typologically transitional industry types are also included: so-called Ak-Kaya-"genuine" and Ak-Kaya-Starosele based on Chabai's analyses of Zaskalnaya V and VI, and Prolom II (Chabai et al. 2000). The 1990s–2000s research indeed showed a very mosaic typological variability of the Crimean Micoquian Tradition and its Neanderthal site system that "erases" typological "index borders" between the traditionally defined cultures. Instead, a large group of assemblages with more or less "smooth and continual" typological variation and their site complex and

Crimean Middle Paleolithic, Fig. 7 Crimean Micoquian Tradition industry of Ak-Kaya type. Flint artifacts: *1–2* bifacial sub-crescent points; *3–5* simple lateral side-scrapers on bifacial tool treatment flakes; *6–7* retouched pieces on bifacial tool treatment flakes. *1–2* Zaskalnaya V buried rockshelter; *3–7* Chokurcha I site. variable settlement types appears. Also, although proposed by "culture archaeologists" (e.g., Stepanchuk in Kolosov et al. 1993), a strict subdivision of Crimean territory into the western region with Starosele culture and the eastern region with Ak-Kaya and Kiik-Koba cultures is no longer supported after identification of the all three industry types in both regions (Chabai et al. 2000; Demidenko 2000). An important method for analysis of Crimean Micoquian typological variability was introduced by Chabai when he proposed to subdivide tools into three broad groups: (1) simple types of unifacial tools – simple, transverse, and double side-scrapers; (2) convergent types of unifacial tools – convergent side-scrapers and points; and (3) identifiable bifacial tools (Chabai et al. 2000: Table 10). The reason for such a method for typological structure was that the tool classes and types both constitute the main body of any Crimean Micoquian tool-kit and

can be readily identified by any archaeologist; old collections can also be analyzed in this way using old publications. As a result, five industry types are structured as follows (Chabai et al. 2000: Table 10). Ak-Kaya "*étalon*-like"-type indices are as follows: simple unifacial tools – 52.5–58%; convergent unifacial tools – 21.3–23.8%; and bifacial tools – 23.6–28.7%. Ak-Kaya-"genuine"-type indices are characterized as follows: simple unifacial tools – 41–57.5%; convergent unifacial tools – 16–35%; and bifacial tools – 16–27%. The Ak-kaya-Starosele type has the following indices: simple unifacial tools – 43–52%; convergent unifacial tools – 37–43%; and bifacial tools – 9–17%. Starosele-type indices have the following indices: simple unifacial tools – 44.3–48.1%; convergent unifacial tools – 38.9–43.4%; and bifacial tools – 12.2–13.3%. The Kiik-Koba type has the following indices: simple unifacial tools – 21.5–37%; convergent unifacial tools – 51.9–56.2%; bifacial tools – 11.1–14.3%. These index variations show certain index overlap between the industry types. Adding new assemblages (e.g., Kiik-Koba-type assemblages from Siuren I and Buran-Kaya III – Demidenko 2000, 2004; Chabai 2004; see in Chabai et al. 2004), typological variability in the Crimean Micoquian Tradition becomes more evident as variations of the three tool groups have the following index deviations: simple unifacial tools – 21.5–58%; convergent unifacial tools – 16–63.8%; and bifacial tools – 9–28.7%. Extreme ranges of the three tool groups vary within intervals between 2.7 and 4 times. Such high Crimean Micoquian Tradition typological variability is caused by diversity in site function related to use of different flint reduction methods and primary and secondary fauna exploitation (see in Chabai and Monigal 1999; Chabai et al. 2000; Chabai 2004; see in Chabai et al. 2006).

The Crimean Micoquian Tradition industrial flint treatment (Demidenko 2003: 130–1) was based on systematical and intensive production and reuse of bifacial tools through typical Micoquian "plano-convex" technique (Figs. 4, 5: 1–3, 6: 1–5, 7: 1–2). Primary flaking processes are characterized by a significant prevalence of bifacial tool treatment debitage over core reduction debitage in any given assemblage. Thus, one of the most typical Crimean Micoquian Tradition technological features is a minor role of core reduction. As a result, most of debitage blanks for unifacial tool production were products of bifacial tool reduction and multiple rejuvenations (Figs. 6: 6–9, 7: 3–7). Unifacial tools (usually produced on short flakes that are very different from Crimean Levallois-Mousterian unifacial tools) are characterized by various convergent forms with many points among them (Fig. 5: 4–5). The Crimean Micoquian Tradition third characteristic feature is almost exclusive use of high quality flints for flint treatment processes and shares of low quality flints or cherts are usually extraordinarily rare. Namely, the three fundamental parameters of the Crimean Micoquian make it distinct from other East European Micoquian industries (see Gladilin 1976) why its assemblages have been grouped under the name of Crimean Micoquian Tradition (Chabai et al. 2000; Demidenko 2003).

Another feature of the Crimean Micoquian Tradition is its chronology, which covers the entire Middle Paleolithic Upper Pleistocene period (c. 120,000 to c. 30–28,000 BP). Taken together, chronological and industrial aspects show that the Crimean Micoquian Tradition, lasting for 90,000 years, preserved its industrial parameters with no change. Such persistence is significant. First, the tradition's lithic technology was very conservative but also capable of meeting needs in the changing Crimean Upper Pleistocene paleoenvironments. Also, according to natural science and especially pollen data for Crimean sites (see in Chabai and Monigal 1999; Chabai et al. 2005), Crimean Micoquian Neanderthals were living in variable landscapes forming two basic groups during this long period. The Last Interglacial and different interstadials are characterized by varying south-boreal forests/forest-steppes. On the other hand, stadials are known through boreal/south-boreal forest-steppe, a boreal forest-steppe, a boreal xeric forest-steppe, and boreal xeric grassland. It should also be remembered that the ungulate species hunted remained about the same during this period: *Equus hidruntinus* and *Saiga tatarica*. Second,

the conservative nature of the Crimean Micoquian Tradition is shown by the fact that no techno-typological changes occurred even when the tradition coexisted with other industries, whether Middle Paleolithic (Levallois-Mousterian) or Early Upper Paleolithic ("Eastern Szeletian" and Proto-Aurignacian) in Crimea (Chabai 2004; Demidenko 2000, 2004, 2008). Indeed, there is no evidence for Micoquian borrowing of any traits from other industries. Thus, it is possible to postulate universal characteristics of the Crimean Micoquian Tradition enabling Neanderthal survival for 90,000 years in Crimea.

Further studies of the Crimean Middle Paleolithic industrial and chronological variability will certainly bring to light new and new interesting aspects.

Crimean Upper Paleolithic

Yuri E. Demidenko
Crimean Branch, Institute of Archaeology, National Ukrainian Academy of Sciences, Simferopol, Crimea, Ukraine

Introduction

The first Crimean Upper Paleolithic (UP) sites in situ and stratified rockshelters of Siuren I and Kachinski (second ridge of the Crimean Mountains, western Crimea) were discovered and excavated by Konstantin S. Merejkowski in 1879–1880. Both Middle and Upper Paleolithic sites were first discovered in the late nineteenth century in the Crimea, but today they differ in numbers of sites and find spots (around 30 for the UP and more than 100 for the MP) (Kolosov et al. 1990a, b; Chabai 2004). The key difference in these sites, however, is relative amount of relevant data at these different sites and their scientific value for the analysis of variability in Crimean Paleolithic industries and chronology. The MP is thus represented by about 30 stratified sites with abundant lithic artifacts and fauna, while the UP record has less than five such stratified sites. Yet despite this paucity, data is still sufficient to interpret the Crimean UP.

Historical Background

History of Crimean Upper Paleolithic Studies and Some Conceptual Interpretations

After the Bonch-Osmolowski's 1920s excavations at Siuren I, this site with three UP layers identified at the time became the key site for the Crimean UP. Bonch-Osmolowski (1934) considered these layers as "corresponding to three different developmental stages of Aurignacian culture." However, attribution to the Aurignacian alone was not accepted in ex-Soviet Paleolithic archaeology. Since the 1950s, the dominant opinion of Soviet archeologists was that the Siuren I sequence covers the entire Upper Paleolithic. The clearest position was expressed by E.A. Vekilova (1957). In her view, the Siuren I finds are "dated" to "Aurignacian"-"Solutrean periods and possibly the beginning of the Magdalenian"-"time of Late Magdalenian and Early Azilian" and the finds "testify to the continuity of human society development in the Crimean peninsula" during the UP. Vekilova also compared the Siuren I middle layer ("Solutrean – beginning of Magdalenian") with redeposited UP flints from the early 1930s Bonch-Osmolowski and Trusova's excavations at Adji-Koba cave (First Ridge of the Crimean Mountains, eastern Crimea), although they noted a similarity between this site and the Siuren I upper layer.

Since the Crimean UP record was limited to materials from only Siuren I and Adji-Koba until the second half of the 1980s, some hypotheses were proposed to explain the surprising rarity of UP sites in Crimea. Bonch-Osmolowski (1934) early on suggested that UP humans moved to the southernmost areas of Crimea during cold periods of the Last Glacial and that their sites did not survive due to significant erosion and the karst topography. Another hypothesis proposed human migrations outside the Crimea during the UP to the Eastern European Plain (Bibikov and Lyubin 1978). A critical analysis of these hypotheses (Kolosov et al. 1990a) rejected both, arguing that the problem is rather related to developing suitable survey strategies to locate new UP sites in Crimea.

The number of UP sites has slowly increased, primarily due to the fieldwork of Yuri G. Kolosov, Vadim N. Stepanchuk, Victor P. Chabai, and Alexander A. Yanevich in the late 1980s. At that time, apart from excavations at the well-known MP sites near Ak-Kaya and Sary-Kaya rocky cliffs (second ridge of the Crimean Mountains, eastern Crimea), Kolosov's team also conducted intensive surveys along the first fluvial terrace of the Biyuk-Karasu river in that area. As a result, Late UP surface finds (e.g., Biyuk-Karasu XIII and XIV) and sites with in situ level(s) (e.g., Biyuk-Karasu III, VI, and IX, Vishennoe II) were discovered (Kolosov et al. 1990a; Yanevich 1992). A few Late UP flints were also found in the upper deposits at Zaskalnaya IX cave in the Red

Valley behind Ak-Kaya (Kolosov et al. 1990a). These surveys in eastern Crimea were also complemented by surveys in western Crimea in the Bodrak river valley (second ridge of the Crimean Mountains) where Kolosov's team discovered in situ Late UP levels at Skalistyi grotto and the open-air site of Skalistoe (Kolosov et al. 1990a; Cohen et al. 1996). Thus, these investigations increased the Crimean UP database, adding, however, only Late UP and Epigravettian, sites.

Major advances in Crimean UP studies occurred when Yanevich discovered and began to excavate the multilevel site of Buran-Kaya III (second ridge of the Crimean Mountains, eastern Crimea) in 1990 and when new 1994–1997 excavations at Siuren I were conducted (see section "Cross-References"). At the same time as the Siuren I excavations, a new stratified Late UP site was also found and partially excavated in 1996 in the Bodrak river valley (Veselskiy 2003–2004).

As a result, the 1990s investigations not only significantly added to but also much changed our understanding of the Crimean UP. Before presenting the new chronological sequence of the UP industries, the Crimean UP sites and their contribution to scientific debates will be discussed.

Key Issues/Current Debates

The Crimean UP Database

The Crimean UP sites can be structured as follows (Fig. 1). There are only two in situ and multilevel sites in rockshelters/grottos with abundant lithic artifacts and fauna: Siuren I and Buran-Kaya III. A single multilevel open-air Late UP site with diagnostic artifacts, including tools, is known: Vishennoe II. Two sites have been found in caves, with a few redeposited but industrially uniform and diagnostic flint artifacts: Adji-Koba and Zaskalnaya IX. Finally, some in situ workshops have been found at flint outcrops, however lacking diagnostic tools: Biyuk-Karasu III, VI, and IX; Skalistoe I; Bodrak; and Skalistyi grotto, as well as separate finds of nondiagnostic flints at Krasnyi grotto, a hyena den based on the faunal remains. These 12 sites comprise the entire Upper Paleolithic database in Crimea.

The other known so-called UP sites (see Kolosov et al. 1990a, b) are find spots with a few UP surface flints (e.g., Biyuk-Karasu XIII and XIV), sites with industrially heterogeneous and redeposited finds (e.g., Shaitan-Koba II Big grotto), and even find spots with ambiguous flints for which period cannot be attributed (e.g., Vitina stoyanka, Kacha, Kochkin domik, Kapselskaya bukhta, Subotkhan). Regarding the famous

Crimean Upper Paleolithic, Fig. 1 Map of the Crimea showing Upper Paleolithic site locations. (Map created by Dr. G. Bataille, Cologne University)

Kachinski rockshelter excavated by Merejkowski in the nineteenth century, the site remains a "thing in itself" because of the loss of finds, the unclear stratigraphy, and the impossibility of undertaking any new excavations there.

There are thus only a few UP sites in Crimea which can be considered as having significant scientific value. The other sites are variably informative and with different functions. Siuren I, Buran-Kaya III, and Vishennoe II will thus be used for the analysis of different research issues and to potentially connect them with the other sites.

Industrial Variability and Geochronological Context of the Crimean Upper Paleolithic

The available data enable the present author to propose the following geochronological sequence for the following seven industries of the Crimean UP: "Eastern Szeletian," Proto-Aurignacian, Southern Caucasus EUP, Late/Evolved Aurignacian, Late Gravettian, Epigravettian, and Final Epigravettian.

The "Eastern Szeletian" at Buran-Kaya III, level C (situated in the stadial between the Hengelo and Les Cottes/Huneborg interstadials, no younger than 36 kyr uncal BP), is characterized as follows (Figs. 2 and 3): bifacial leaf "biconvex" points, bifacial trapezes mostly made on small flakes and chips produced during bifacial point production and rejuvenation, and end scrapers, including fan-shaped and a series of worked bone tubes (see in Chabai 2004; Chabai et al. 2004). The Crimean "Eastern Szeletian" is very similar in technology and typology to another Szeletian sensu lato industry in Eastern Europe, "Kostenki-Streletskaya culture," well known at sites northeast of Crimea in the Middle and Lower Don River areas (Kostenki XII, layer 3, Kostenki VI, Kostenki I, layer 1; Biryuchiya Balka sites) (Anikovich et al. 2007). The only formal differences between the two East European Szeletian industries are the lack of triangular bifacial "biconvex" points with a concave base in the Crimean industry and the lack of bifacial trapezes in the Don industry. At the same time, the Don small-sized triangular bifacial "biconvex" points with a concave base can be also considered a variant of the Crimean bifacial trapezes with a concave base. Accordingly, the two industries can be considered as "industrial cousins" within the East European Szeletian sensu lato. The hypothesis of the appearance of the "Eastern Szeletian" in Crimea from the north as a result of population movement of the "Kostenki-Streletskaya culture" (Chabai 2004) following the Don river valley deserves much attention and should be considered the most probable in the present state of the East European Szeletian research (see also Demidenko 2008).

The Proto-Aurignacian is present at Siuren I, Units H and G (situated in the stadial between the Hengelo and Les Cottes/Huneborg interstadials and Les Cottes/Huneborg interstadial, older than 31 kyr uncal BP) (see Demidenko, "► Siuren I Rockshelter: From the Late Middle Paleolithic and Early Upper Paleolithic to the Epipaleolithic in Crimea" entry, Fig. 5; also see in Demidenko et al. 2012). It is characterized technologically by the dominance of bladelet production via the reduction of "regular" and "carinated" bladelet cores to produce mostly on-axis and flat/incurvate blanks. Typologically it is represented by retouched microliths where alternate Dufour bladelets of Dufour subtype account for almost 70%, as well as some Font-Yves/Krems points; the presence of carinated and thick shouldered/nosed end scrapers and simple end scrapers on blades; a dominance of angle and truncation burin types, while dihedral type are subordinate; a rare presence of Aurignacian blades; and a minor presence of scaled tools, truncations, and perforators. The Siuren I Proto-Aurignacian has direct comparisons within the European Proto-Aurignacian with Dufour bladelets of Dufour subtype, in territories west of Crimea: in Western Europe (e.g., Fumane, levels A3–A1 and Riparo Mochi, layer G in Italy; Le Piage, level K in France; Cueva Morin, levels 9–8 in Spain) and Central Europe (Krems-Hundssteig in Austria; Tincova, Romanesti-Doumbravita, and Cosava in Romania; Kozarnika cave, layer VII in Bulgaria; Beregovo I in the Ukrainian Transcarpathians). It is thus suggested by the present author that the Crimean Proto-Aurignacian is the result of population migrations from the west into

Crimean Upper Paleolithic, Fig. 2 Buran-Kaya III, level C; "Eastern Szeletian"; and "Kostenki-Streletskaya culture," diagnostic artifact types. (After Chabai 2004)

the south of Eastern Europe via the "Lower Danube Corridor".

The "Southern Caucasus EUP" at Buran-Kaya III levels 6–5 to 6–1/5–2 (Huneborg stadial and Arcy interstadial, c. 35–31 kyr uncal BP) (see Demidenko's entry ▶ Crimean Late Middle Paleolithic to Early Upper Paleolithic Transition in this volume, Fig. 2, 4, 6; Yanevich 2000; Yanevich et al. 2009; Prat et al. 2011) features, technologically, predominant reduction of both exhausted narrow-flaked bladelet cores on plaquettes and multifaceted (not carinated) burins producing very numerous incurvate and twisted narrow bladelets and microblades, and, typologically, a dominance of "non-geometric microliths" with fine backed dorsal retouch (nearly 75% of all formal tools) where unusually around half are represented by points, particularly those with bilateral fine retouch. Based on the lithic assemblage structure, as well as numerous bone tools and personal ornaments, the Buran-Kaya III industry finds direct comparisons in the east

Crimean Upper Paleolithic, Fig. 3 Buran-Kaya III, level C; "Eastern Szeletian"; and "Kostenki-Streletskaya culture," bifacial points and trapezes. (After Chabai 2011)

(Mezmaiskaya cave, levels 1C–1A, Northwestern Caucasus) and south (Ortvale Klde rockshelter, layers 4d & 4c; Dzudzuana cave, layer D, western part of Southern Caucasus). The present author thus proposes that the origin of Buran-Kaya III, levels 6–5 to 6–1/5–2, is the result of the population movement from the Southern Caucasus into both Northwestern Caucasus and Crimea.

The Late/Evolved Aurignacian at Siuren I, Unit F (Arcy and Maisières interstadials, c. 30.9–29 kyr uncal BP on ungulate bone samples and c. 28.2–26.6 kyr uncal BP on bone artifact samples) (see Demidenko "▶ Siuren I Rockshelter: From the Late Middle Paleolithic and Early Upper Paleolithic to the Epipaleolithic in Crimea", Fig. 6, also see in Demidenko et al. 2012), is defined by the primary reduction of mainly off-axis and twisted microblades produced on both "regular" and "carinated" bladelet cores, and carinated tools (end scrapers and notably burins). The tool kits include carinated and thick end scrapers and also flat shouldered/nosed end scrapers, dominance of dihedral and carinated burins, and typically Roc de Combe subtype ventral bladelets and alternate Dufour bladelets (c. 45% of all microliths) as well as pseudo-Dufour dorsal bladelets (c. 40% of all microliths) with marginal abrasion retouch. The Siuren I Late/Evolved Aurignacian finds archeological similarities in the west, within the West European Aurignacian II–IV with Dufour bladelets of Roc de Combe subtype (e.g., Roc de Combe, levels 6–5 and Abri Pataud, levels 8–7 in France; Cova Beneito, levels B8–B9 in Spain) and Late/Evolved Aurignacian complexes such as at Mitoc-Malu Galben (Romania) in Eastern Europe. Therefore, the author proposes a European western vector of migration into Crimea.

The Late Gravettian at Siuren I, 1920s third "artificial excavation level" of the upper layer and 1990s Unit D (Upper Pleniglacial of the Last Glacial, probably c. 24–23 to 20 kyr uncal BP) (see Demidenko "▶ Siuren I Rockshelter: From the Late Middle Paleolithic and Early Upper Paleolithic to the Epipaleolithic in Crimea"

entry, Fig. 7, also see in Demidenko et al. 2012), is represented by a few but industrially diagnostic cores and tools: elongated bidirectional blade and bladelet cores, an elongated Gravette point with truncated base, a truncated blade, a truncated bladelet, a "microsaw" with one backed lateral edge, two *pièces à cran* on a blade and a bladelet, and two bidirectional fragmented bladelets with a backed lateral edge. Such artifacts have no comparisons within the Crimean and North Black Sea region Epigravettian assemblages and may indicate population movement from the East European Plain to the south during the onset of the Last Glacial Maximum.

Finally, the last two UP industries are related to Epigravettian occupation in Crimea. Given the much higher number of sites and variability in site function, the Epigravettian sites are the most representative UP sites in Crimea. Based on stratigraphy, lithic assemblage, and fauna, the Epigravettian reference site is Siuren I, 1920s second "artificial excavation level" of upper layer/1990s Unit A, along with some flints found in humus. The Siuren I Epigravettian complex can be joined by another site, but Final Epigravettian, Vishennoe II, which, however, lacks fauna (Yanevich 1992). These two reference sites are complemented by other less informative Epigravettian sites: upper layers at Adji-Koba and Zaskalnaya IX caves; Biyuk-Karasu III, VI, and IX; Skalistyi grotto; and the open-air sites of Bodrak and Skalistoe I. Thus, the Crimean Epigravettian is represented by ten sites with both in situ and redeposited but still homogeneous assemblages.

The Epigravettian and Final Epigravettian complexes can be differentiated by technology and typology. The Siuren I Epigravettian can be characterized as follows.

Technologically, it is based on intensive reduction of short single-platform and double-platform bidirectional bladelet cores (c. 3–4 cm long) in about equal percentages. Typologically, end scrapers and burins are fairly rare, whereas backed bladelets and microblades with thick abrupt retouch are much more common and also include a few "microgravettes" and a "rectangular" piece (see Demidenko, "▶ Siuren I Rockshelter: From the Late Middle Paleolithic and Early Upper Paleolithic to the Epipaleolithic in Crimea," Fig. 8a, see in Demidenko et al. 2012). The Vishennoe II Final Epigravettian, defined by Yanevich (2000) as a separate Final Epigravettian type from the "first half of the Final Paleolithic" and by data from Vishennoe II, level Б, can be characterized by single-platform and double-platform bidirectional narrow-flaked blade cores and a special microlith set – "triangles with oblique or straight retouched base," "low crescents of varying shape" (Fig. 4), and "rectangles with two retouched narrow ends and a lateral edge" (Yanevich 1992). No absolute dates are available for the Epigravettian and Final Epigravettian sites, but some hypotheses have been proposed. The present author is inclined to situate the Epigravettian from Siuren I and Adji-Koba to the period 19–18 to 15,000 uncal BP (see in Demidenko et al. 2012). It is also assumed that the Crimean Epigravettian is connected to Epigravettian complexes located west of Crimea, in the eastern Carpathians in Romania. Yanevich (1992) considers the Vishennoe II Final Epigravettian to fall within the "final stages of the Pleistocene: Dryas II, Allerød, and Dryas III," 12–10 kyr uncal BP. He also connects the appearance of the Final Epigravettian in Crimea with "immigrants of the Late Moldova culture from the Dniester river areas" (Yanevich 2000).

The other Crimean Epigravettian sensu lato sites could be connected to the above-discussed Epigravettian and Final Epigravettian as follows. Workshops at Biyuk-Karasu III, VI, and IX and Vishennoe II, levels A, A1, Б1, Б2, Б3, and B, based primary reduction data (Kolosov et al. 1990a; Yanevich 1992), are similar to the Vishennoe II Final Epigravettian. However, located near these sites, Zaskalnaya IX cave with five backed points and bladelets is typologically similar to the backed tools from the Siuren I and Adji-Koba Epigravettian assemblages. An attribution of the workshops at Skalistyi grotto and the open-air sites of Bodrak and Skalistoe I in western Crimea is much less clear. Their assemblages, which lack diagnostic tool types, could be either

Crimean Upper Paleolithic, Fig. 4 Vishennoe II, level Б, Final Epigravettian. *1–12*, *16–25*: triangles with oblique or straight retouched base; *13–15*: crescents. (After Yanevich 1992)

Epigravettian or Final Epigravettian. Only very hypothetically can they be compared to the Siuren I and Adji-Koba Epigravettian based on the fact that sites like the Vishennoe II Final Epigravettian are as yet unknown in western Crimea, while Siuren I is 15 km south of these workshops.

Concluding Remarks

Data is now available to support strong arguments in favor of a complex multi-industrial Upper Paleolithic sequence in Crimea, from the "Eastern Szeletian" and Proto-Aurignacian (older than c. 31 kyr uncal BP) to the Final Epigravettian (c. 12–10 kyr uncal BP). This sequence, albeit with some hiatuses, covers the entire Upper Paleolithic period of the Last Glacial. The most poorly represented period is the Late Gravettian in Crimea, suggesting a possible temporary hiatus in human occupations in Crimea during 28–27 to 19–18 kyr uncal BP, which also corresponds well to a similar hiatus for the entire Great North Black Sea region during c. 28–27 to 22 kyr uncal BP (see in Demidenko 2008). On the other hand, industries and occupational episodes of "Eastern Szeletian," Proto-Aurignacian, Late/Evolved Aurignacian, and Southern Caucasus EUP, while represented by impressive assemblages, fauna, and paleoenvironmental data, are only known from single sites – Buran-Kaya III in eastern Crimea and Siuren I in western Crimea. It is indeed urgent to "develop more flesh" on the Crimean Upper Paleolithic "skeleton" through the discovery of new sites in different areas of the peninsula. Only then will it be possible to investigate models of changes in landscape use by the different UP human groups and their modes of survival. These questions can now be addressed for the Epigravettian and Final Epigravettian, which are represented by base camps, short-term sites, and workshops at flint outcrops; although incomplete, these are known in both piedmont and mountainous Crimean areas.

Finally, the question of possible generic links between the different Crimean UP industries and

their subsequent "historical fates" should also be addressed. In this regard, the lack of any industrial successions and "evolutionary links" between the Crimean UP industries should be strongly stressed. All of the seven known UP industries should be regarded as being transported to Crimea rather than reflecting local continuity and change through time. Migration from the west is represented by humans bringing the Proto-Aurignacian, Late/Evolved Aurignacian, and Epigravettian. Migration from the north is connected to humans with "Eastern Szeletian," Late Gravettian, and Final Epigravettian industries. Migration from the south is associated with the Southern Caucasus EUP. Such an absence of local Upper Paleolithic human groups is not very surprising when one considers that the present-day Crimean peninsula was the southernmost terrestrial area of the Great North Black Sea region's rather continuous belt of land in the south of Eastern Europe, extending from the eastern Balkans in the west to Northwestern Caucasus in the east, during most of the Upper Paleolithic. As a result, the Crimea was open to human migrations into its territories from any direction. Moreover, the absence of any evolutionary trends within the Crimean UP also testifies to rather short-term stays of these different UP human groups in Crimea; they ought to be considered as temporary visitors and not actual long-term residents in Crimea. It is indeed quite reasonable to search for comparable UP industries outside Crimea.

Concluding this overview of the Crimean Upper Paleolithic, it is also of interest to note the so-called Crimean UP "echo and epigone": the "Shpanskaya Mesolithic culture" during the Boreal and start of the Atlantic periods in the Holocene, c. 9–7 kyr uncal BP (Yanevich 1993) that is part of the European Early Holocene Epi-Tardigravettian (Kozlowski and Kozlowski 1979; Demidenko 2000). These industries show the clear Epigravettian characteristic of numerous non-geometric microliths, suggesting the "formation of the Shpanskaya culture on the basis of local Epigravettian Final Paleolithic industries of North Black Sea region and Crimea" (Yanevich 1993) and thus population continuity.

Critical Community Engagement in Heritage Studies

Veysel Apaydin
Institute of Archaeology, University College London, London, UK

Introduction

In last decade, the field of community engagement has developed and improved itself within the broader spectrum of heritage studies that include understanding, interpreting, engaging, managing, and conserving cultural heritage and material culture. Understanding of the community and its role in the field of heritage studies have also been widely studied and discussed, including ethics, approaches, and methods (Jones 2017; Ireland and Schofield 2015; Waterton 2015; Watson and Waterton 2011; Waterton and Smith 2010; Moshenska 2017). While heritage studies has developed and put forward different methodologies, in practice, engagement with communities raises several issues, particularly identifying and clarifying effective methods and approaches as heritage is a complex subject and strongly interlinkage with social and political issues.

In this entry, I consider issues around the term "critical community engagement" in heritage context. In heritage studies, community engagement encompasses the significance of sharing knowledge and power as well as learning through material culture and life experiences of the communities who attach and ascribe values and meanings to cultural heritage. Critical community engagement raises difficult questions for the researchers: how do we engage and what kind of methodology is more ethical and effective? Some community engagement projects impose knowledge, therefore changing the value and meaning of material culture, while others are including local and indigenous voices and aim to be more participatory. However, to date, in praxis the field of community engagement in heritage studies has employed very fluid methodologies to be ethical and effective and therefore critical. In this entry, I argue that community engagement in heritage context can be more ethical and effective using ethnographic field methods from a critical perspective by exposing and considering the diversity, social, cultural, political, and economic backgrounds of communities.

This entry will first present and discuss how community can be diverse and the relationship of communities with heritage can be very complex and second introduce effective and ethical ways of community engagement by discussing democratization of community engagement and the impact of dialogue to be more inclusive and consider all diversities in community. This will be accomplished by taking into account of recent approaches, and particularly those of Paulo Freire, whose works and research challenged with the dominant pedagogy of education from a critical

perspective and brought radical and critical methods to the social sciences.

Definition: The Notion of Community and Interlinkage to Heritage

It is quite significant to explore the term "community" in heritage context. As the term "heritage" is itself very abstract and diverse, so the "community" is also abstract and ambiguous as a heritage term (Crooke 2010: 17). Particularly with the globalization of the world, people can come together and make any sort of community, especially by using technology. For instance, online communities who come together around shared ideas and values. Social media communities are a good example of community, as people create platforms around the ideas and values that they want to share and advocate.

Cohen (1985) describes community as a group of people who share common aspects and values which also frame the boundaries of group identity and separate them from other communities. Cohen's description gives the sense of communities made out of obligations or bound up by outside force. The main reason for this is that boundaries are framed because of a threat or danger that comes from outside of the group. Bauman (2001: 1) points out:

> community is a warm place, a cosy and comfortable place. It is like a roof under which we shelter in heavy rain, like a fireplace at which we warm our hands on a frosty day . . . in the street, all sorts of dangers lie in ambush; we have to be alert when we go out . . ..

Because of outside force and threat or individual and social needs people come together and make the community; therefore, community is itself not something natural, but it is bound to outside factors and indispensable for people to be able to survive. Within this process communities develop their own shared heritage, which also comes to define the community (Crooke 2010: 17; Waterton 2015: 54). This process of making communities is even evident in the Neolithic period: when considering different Neolithic communities, they all have different customs, social practices, as well as lifestyles. Although there are many factors play role in construction of social values, practices, e.g., natural environment, geographic structure, archaeological evidence suggests that most of the Neolithic communities shaped their values because of their social needs, interaction, as well as protection from outside threats. For instance, a Neolithic site Çatalhöyük, the house architecture and structure was shaped for a social interaction or as Lévi-Strauss (1987) describes house becomes a form of social organization place. This also makes the main foundation of building community and people feel safety and protection in community. Similarly, many highland communities shaped their life on the top of the mountains to protect themselves. Isolating themselves from one to other also shapes communities and establishes their boundaries.

In today's world, while outside forces are still shaping communities, these forces act for political purposes such as identity making, national narratives, and nation making. There are many different variations in community construction today, but because of political pressures, most define themselves with their ethnic, social, and political structures (Crooke 2010: 19). These three factors therefore are the most significant in community making and define every community as socially, culturally, and politically distant from each other. This should also underpin the community concept in heritage context.

Although since 1970s and 1980s community engagement in heritage studies has shown great progress, social, political, ethnic, or economic background of communities has been widely neglected. Similar models and methodologies have been used in many parts of the world, quite often in a "top-down" manner which imposes values and knowledge on communities. Heritage is without doubt plural (Ashworth et al. 2007: 2–3) in concept as it has different meanings and values that are attached by the communities who develop emotions and memories in connection to heritage over a period of time. These values, affections, and memories are quite subjective, as they are developed and attached by socially, culturally, and politically different groups of people. Every community has a different interest in

heritage and heritage sites, and therefore, their relationship with the heritage is shaped accordingly. This also relates to community expectations from heritage: some communities may have a political interest in heritage which may be significant for their identity; some may have spiritual expectation as some sites are religiously important for some communities; or specific heritage or sites may be economically significant for some communities (Apaydin 2016a: 375–376).

Furthermore, the importance of the daily relationship of communities with heritage, heritage site, or historic places and landscapes has also been widely neglected. Every local community has a different scale relationship with the local heritage apart from those being used for national-level imposed identity and nation making, i.e., in developing national narratives and heritage discourses (Apaydin 2018; see Smith 2006). Alternately, some heritage sites may not be considered as historically important for some local communities, as in the case of some community members living near the site Çatalhöyük who do not consider this UNESCO World Heritage Site as their heritage and therefore do not value it at all (Apaydin 2016b). Therefore, it is important to consider these subjects during community engagement in heritage studies to avoid being a "top-down" imposition of heritage values but most importantly for being more ethical and effective during engaging with communities.

Key Issues: Community Engagement in Heritage Context

Community engagement in theory and practice has a long history within social sciences, and many case studies have been described in many parts of the world. Although it is more recently taken up in heritage studies compared to other fields in the social sciences, many projects and publications in the field of heritage studies have pointed out the difficulties, issues, and complexities inherent in community engagement (Waterton 2015; Watson and Waterton 2011). However, community engagement still has great challenges, difficulties, and issues that need more clarification. One of the main issues is that "community" has been considered as a singular homogenous entity. As I discuss above and as has been discussed by other scholars in the context of heritage studies (Crooke 2010: 19; Waterton 2015: 54–55; Waterton and Smith 2010), communities are very diverse and one certain community might even contain many other subgroups (Waterton 2015: 55). On many occasions, heritage professionals who work in community engagement fall into this trap by neglecting the fact that of how communities are diverse.

While every single community has diversity, whether it be of, i.e., gender, age, education, some communities also have ethnic, economic, and political diversity within themselves. These differences certainly impact on valuing heritage and material culture as well as worldview. A recent study (Apaydin 2018) has exposed that while those differences within one community impact on its construction, they also impact on individuals from those communities' own interpretations of heritage. Therefore, the internal diversity of communities and the political context that they live in need to be taken into account during the community engagement.

The main reason for considering communities as a singular subject is, I would argue, that communities have been considered as a pure "data sources" (Koster et al. 2012: 200; Waterton 2015: 59; Apaydin 2016a: 372) on many occasions for academic research projects. Some scholars have been able to overcome this issue and consider the diversities of communities with results reflecting this in their research projects and publications. Having said this, the field of heritage still needs more qualitative case studies to expose the diversity of communities as well as how to include communities more effectively in community engagement projects, heritage management process, and how to share the knowledge and power produced through heritage studies with communities.

All these questions surely are very complicated, great dilemmas and challenges for professionals and academics in this field. This is also related to the "top-down approach" which has impacted this field for many years. In most community engagement projects, academics and heritage

professionals consciously or unconsciously have imposed knowledge and values to communities instead of learning about the dynamics of communities and the values that they have attached to heritage and material culture. In these cases, community engagement projects can even undermine local and indigenous knowledge. Because of the life experiences and relationship with the heritage and material culture, every single person develops knowledge and has capacity to reflect on any heritage related issues. Here, the task of the heritage professional or academics should be more constructivist, to expose that knowledge and encourage individuals and groups to act more actively about the heritage that is developed and valued over a time by the community, as well as learning more about the dynamics of the relationship between communities and heritage. In an ontological manner, if our aim is the protection and preservation of diversity of societies, heritage, and material culture, how this is possible by excluding communities from this process? If our aim is to expose the complex relationship between community and heritage, how this is possible by neglecting backgrounds, particularly political context along with others, of the communities?

While critical approach to community engagement is preventing ethical issues and for being "top-down" it also gives more flexibility and reflection about communities. There have been many attempts to overcome some of these issues for being participatory, as it is the recent trend in community engagement, and in many occasions it has proofed its very successful though vague, undefined, and unclarified aim and goals. Not developing unique and critical methodology for each project in community engagement raises more questions than answers and solutions.

International Perspectives: Critical Approach in Community Engagement

Paulo Freire was one of the greatest thinkers and educators of the twentieth century. The publication of *Pedagogy of the Oppressed* without doubt is one of the radical ways of looking at education and community development which challenge with the dominant ideologies and power structures while aiming at achieving social justice, particularly for communities who live under conditions of poverty (Allman 1988; Mayo 2004). According to Freire (1993, 2005), every educator or community worker needs to be as critical as possible, and the roles of educator or community worker must be defined and should be equal to the community members. As Freire describes it, an educator or community worker also learns from the individuals in the classroom, or in this case in the community (Freire 1993).

The work of Freire without doubt challenges with the common approach "top-down" and critically questions the power relationship between educator or community worker and the people they serve to be more democratic. It emphasizes the knowledge of local people and helps to develop sustainable communities. Freirean thought focuses on transformation of life experiences and stories of people whose lived realities are taken into account seriously. For Freire, the "dialogue" method is the main tool to achieve this critical approach in praxis.

In heritage context, community engagement should always be about the stories of the people as well. Personal experiences in the past and the present are the basis of community construction as well as shaping the values, memories, and attachment of people to heritage and material culture. As Jones (2017: 25–26) points out: "contemporary communities re-work, and reproduce, the materiality and meaning of the historical landscape through performance and practice." Therefore, a community worker needs to encourage people to expose stories that are hidden behind the "performance and practice" in as detailed as possible through dialogues, and the exposing stories of people should be the main resource to shape the aims and goals of research. This kind of critical community engagement will avoid being "top-down" and provide a grounding for community worker to be able to more "bottom-up," ethical, and effective during the community engagement.

The theories and methods of Paulo Freire focus on democratization and effective dialogue with communities to be able to be as people-centered as possible, to act and reflect for the benefit of

communities, and to understand the discourses that shape community life and community construction by critically approaching to issues that are developed within society. For the heritage context, the question still remains: how can we be more critical and therefore effective and ethical? What is the best way of engaging communities and exposing community construction and the interlinkage between community and heritage?

The key tool to answer these questions is that, as Jones (2017: 26–27) emphasizes, we need to apply more qualitative research methods to understand "social value and meanings" in heritage context. Other social sciences have effectively used and applied qualitative social research methods. So, what is the benefit of carrying out ethnographic field methods, e.g., interviews, participatory observation?

In a heritage context, as I discuss above, community, heritage, and material culture cannot be separated from each other as the community makes the heritage and heritage also defines the community. Thus, every single aspect and dynamic of the community should be exposed, particularly social, cultural, economic, ethnic, and political underpinnings, as these play a large role in the construction of communities and therefore in heritage making (Fig. 1). Designing appropriate research methodology is the key for identifying these aspects and effective community engagement, but the community worker must have sufficient knowledge about the community they aim to work with and the values and meanings of heritage and material culture for that community.

A community worker should be able to combine and use more than one ethnographic field method in a heritage context in order to be able critical, effective, and get sufficient knowledge. They should aim to focus on the dynamics of the community by being people-centered, and the goal needs to be defined through the communities' development by providing grounds for members of communities to express their needs, expectations, and most importantly life experiences. As academics or heritage specialists we often carry out interviews, but questions and answers do not always provide sufficient knowledge about communities. For instance, structured questions always lead people and do not let them speak freely; in other words, we give direction to our participants. As Jones (2017) points out, combining more than one qualitative methods provides effective ground to get detailed knowledge about communities and material culture and its interpretation. Therefore, I argue that participatory observation is the key method to expose those aspects that are neglected in the interviews, surveys, or other forms of social research methods. It gives great insight about communities whose social, political, and economic backgrounds are much more complicated than we

Critical Community Engagement in Heritage Studies, Fig. 1 The complex relationship of community and heritage, and the dynamics that forms this interlinkage

may think. Furthermore, it also gives greater understanding about the relationship of communities' daily life to heritage as well as answering the questions of how heritage is valued or not valued and how memories and emotions are developed through heritage. This will help to expose hidden discourses that are embedded within the community.

In my recent research (Apaydin 2018) that focused on exposing different uses of heritage, and valuing and interpreting material culture from a different perspective, there are examples of how to use, for instance, two different ethnographic methods together and the benefit of using these different methods together. The medieval site Ani, located in the east of Turkey, on the border of Turkey and Armenia, marks a conflict between Turkish and Armenian nationalists. The site and its monuments also has been used for identity making and national narratives by both sides. The semi-structured interviews that I run during the fieldwork exposed this different interpretation of this heritage site as well as defining the authorized heritage discourse that are developed by Turkish nationalists. However, the participatory observation method that I used to expose historical relationships between community and heritage also provided ground to understand the fact that the site also represents different meanings and values for some of the local village people who live next to the site. The site is significant for those villagers because the site takes important place in their daily life, without forming part of political discourses, as the site used to be a grazing area for animals, a place where villagers used the site for social activities in which they develop memories and emotions and attached values. Therefore, while the site is significant economically, it is also significant emotionally for these villagers. Since the site became a UNESCO World Heritage, this economically and socially impacted locals' life and changed the value and attachment of locals to the site. Thus, while participatory observation increase the effect and impact of dialogue between community worker and members of the community, it also helps to expose embedded meanings and values that are developed, and most importantly, it provides ground for to be as critical as possible seeing, feeling, and experiencing the life of local people.

As can be seen the site itself, the community and the relationship with the heritage site, has become quite complicated. Semi-structured interviews and questionnaires can help to expose some of the aspects that mark the interlinkage between the local community and the site. However, as a community worker, before reaching the conclusion and most importantly before making any interpretation, through participatory observation, it is necessary to see, sense, and feel these changing dynamics that impact significantly on communities and the meaning and value of heritage for them. Furthermore, in critical community engagement, as heritage practitioners or academics, we need to critically think and find solutions to how our work can be used for the benefit of the community who may need support for sustainability and development, or how community engagement can serve as a bridge in building peace and a tool for reconciliation using cultural heritage between communities in conflict.

Conclusion: Future Directions

The interlinkage between community and heritage is very complicated and many dynamics play a role in this reflexive relationship. Because of this, community engagement is one of the most difficult areas in heritage studies and therefore needs the extra consideration of a critical approach to be able to be more effective and ethical in engaging communities. Although recent developments in community engagement have brought new perspectives, approaches, and research methods to this field, there is still a need to develop new methodologies in order to increase the "dialogue" between community worker (or heritage field worker) and communities themselves to achieve a critical community engagement. There is still a need to clarify and expose our approach, aim, and goals in this field as well as to turn our works toward communities benefit and use. Therefore, first a community worker needs to delineate their role during community engagement. Second, a community

worker needs to define every single dynamic of the community they work with, particularly to expose diversity and subgroups within the community. As I point above, every community draws boundaries between each other. These boundaries are set for many reasons, but social, political, ethnic, and economic backgrounds are the crucial aspects of any community that needs to be explored. Community workers should design their research methodology in parallel to those characteristics using mixed ethnographic methodologies.

Critical Historical Archaeology

Lou Ann Wurst
Western Michigan University, Kalamazoo, MI, USA

Introduction and Definition

The subject of this entry, critical historical archaeology, can mean several different things. One common reading would be as Critical Theory as applied in historical archaeology. This obviously directs our attention to the copious work of Mark Leone and his students. Another meaning would emphasize the role of critique in historical archaeology. This perspective includes critical theory, but broadens the focus to include other aspects not strictly under its purview. Both of these meanings will be explored in this entry. In its most basic form, critical archaeology can be defined as using the skills and craft of archaeology to understand the structures of inequality and oppression in the world. Therefore, a Critical Historical Archaeology directly confronts and challenges the history, nature, and structure of inequalities in capitalism. A critical historical archaeology explicitly uses the activities of archaeological projects and knowledge about the past to engage in political struggles in the present.

Archaeologists have used many different terms to capture these ideas: critical theory, praxis, pragmatism, public scholarship, public archaeology, activist archaeology, action archaeology, and civic engagement. A survey of how archaeologists have approached these issues demonstrates that our activities occur at several different scales: larger scale issues that confront the very structures and ideologies of the capitalist system itself, to smaller, local scales that deal with the inequalities and concerns of local contexts and communities. Each of these perspectives takes as axiomatic that archaeology is as much about the present as it is the past, and seeks ways to make our work socially relevant to political concerns of the modern world (Little 2007; Little and Shackel 2007; McGuire 2008; Sabloff 2008; Stottman 2010).

Historical Background

Critical historical archaeology in its various guises can trace its roots to Marxism. Marx expended a great deal of energy studying capitalism, the same topic that defines our subdiscipline. Rather than a quest for abstract knowledge, Marx undertook these exhaustive empirical investigations in order to transform the capitalist system based on exploitative social relations. Marx and Engels (1970: 123) famous quote "the philosophers have only *interpreted* the world, in various ways; the point is to *change* it," indicates the political nature of their scholarship. All Marxists would agree that there is real oppression and exploitation in the capitalist world and that a vital part of any scholarship is challenging these wrongs. In this way, Marxism is inherently political and subversive of modern capitalist society. A Marxist archaeologist must always ask "scholarship for whom?" and question whether their scholarship challenges or reinforces the power relations of the social world (McGuire et al. 2005: 368). For archaeologists, this means recognizing that our knowledge of the past is created in and influenced by modern social and political conditions that derive from a capitalist system defined by relations of power and inequality that are unjust.

A Critical Historical Archaeology is most clearly associated with the work of Mark Leone and his students. Leone's work was inspired by Marxist scholars of the Frankfort School, Lukacs, and the French Structural Marxism of Louis Althusser, in particular Althusser's notion that a dominant ideology creates a false consciousness for all members of society. Leone began with this problem of ideology and wondered why our taken-for-granted assumptions of the world permeate every aspect of daily life, and work so effectively to uphold dominant interests while making true knowledge of class interests difficult. The driving force of Leone's work was to uncover and critique the workings of ideology in modern Capitalist society. Once armed with this knowledge, people could work to overcome it: "ideology serves to reproduce society intact; knowledge, or consciousness of ideology, may lead to illumination or emancipation" (Leone et al. 1987: 284). Leone and his students focused their research on many aspects of everyday life, such as eating utensils, type face, clocks, town planning, and objects related to personal hygiene, as well as the way that historical knowledge is presented to people through museum exhibits. The dominant theme was to demonstrate that our notions of segmentation, standardization, and individualism were intimately connected to the dominant ideology and thus capitalism (Leone et al. 1987). Once aware of how ideology masks the structures of capitalism, people could struggle to change it.

To promote consciousness and change, the Annapolis' public education program introduced visitors to the contradictions and social inequalities of the capitalist system evident in landscape, architecture, and material culture in order to illuminate "elements of daily life that are normally concealed" (Leone et al. 1987: 291). The project organizers sought to create a participatory experience that would engage the tourists in a critical reflection of the colonial history of the United States. They sought to challenge the dominant ideology by demonstrating to the tourists that the historic Annapolis that they were presented with had been constructed to support dominant class interests. In the end, this challenge to the standard ideological history of Annapolis failed to overcome the official history and the cultural and social relations that produced it (Leone 2010).

The public generally responded by reinterpreting the alternative vision in terms of their preconceptions derived directly from the ideology being critiqued. These responses should not have been surprising given the background of the tourists who visit Annapolis and the types of historical interpretations that they were already exposed to. The fact that Annapolis is a high-end tourist destination only amplifies this trend. Clearly, in Annapolis, the privileged classes of US society did not question the dominant history even when presented with alternatives.

The archaeological literature has been peppered with critiques of Leone's Critical Theory approach, but few more damming than his own recent retrospective (Leone 2010). Leone's account presents his frustration and recognition that piercing the ideology alone could not lead to the kind of social transformation that he hoped for. He argues not that Althusser was wrong, but that because he was right, his ideas are too unsettling and could never be accepted since they foreclose any hope for change except through violence (Leone 2010: 182). As a result of this realization, Leone (2010) adopted instead Habermas' notion of communicative action. He recognized that the people who would be the most open to alternative histories were those who had been most directly and negatively affected by the contradictions, inequalities, and exploitation in society, a position more in keeping with Marx's idea that the working classes, because of their position in the productive relations of capitalism, are better positioned to achieve true class consciousness. Leone's research has thus shifted focus to an African-American community in Annapolis and to a project that actively incorporates members of that community. This shift makes it difficult for archaeologists to assume they know the interests of the masses like some intellectual vanguard. Instead they must actively work with the community to develop an alternative historical discourse that meets the interests of both parties. The current program of the Annapolis Project confronts both the practice of the archaeologist and the racial and class realities of modern Maryland (Palus et al. 2006), and shifts the focus of a critical historical archaeology toward a collaborative approach that is discussed below.

Other scholars have approached a critical historical archaeology through the Marxist concept of praxis. Praxis refers to the uniquely human ability to knowingly and creatively make and change both the world and, in the process, ourselves. Marxist praxis implies a dialectical relationship between gaining knowledge of the world, critiquing the world, and taking action in the world (McGuire et al. 2005). As archaeologists, we gain knowledge through the empirical study of the past. This knowledge is trivial if it is not linked to a critique of the world; the knowledge we generate gains relevance from how it informs, challenges, or reinforces the Marxist critique of capitalism, including ideas of dominant ideologies that so engaged the Critical Theorists. Critique also includes the critical self-examination of the role of scholars in the world and of how their scholarship reinforces or questions the inequalities in society. Without accurate knowledge, action can lead to unintended and often pernicious consequences. In the absence of self-critique, this can result in self-delusion, the idea that archaeologists are involved in positive or progressive change when they may not be.

Like the Critical Theory of Mark Leone, Historical Archaeologists using this concept of praxis recognize that inequality and exploitation characterize the structures of capitalism, but rather than beginning with ideology, they use class as their entry point into the analysis of these social relations (Wurst 2006; McGuire 2008; Gadsby and Barnes 2010). The goal entails building knowledge about the class structure, combining this knowledge with a critique of inequality and exploitation in capitalism, and using this awareness to foster action to make our world a more humane one (McGuire 2010).

Randall McGuire and his colleagues of the Ludlow Collective have used this approach to build an archaeology of political action in their study of Colorado's 1913–1914 Coalfield Strike and the Ludlow Massacre Site (Saitta 2007; McGuire 2010). The project has focused on the massacre site as well as a nearby company town to gain a richer and more systematic understanding of the everyday lived experience of the Colorado miners and their families. The excavations themselves are a form of political action since they

focus attention on the events of 1913–1914, making them news again, and raise public awareness of the class basis of American history. The project has also worked directly with the United Mine Workers to build educational programs that include interpretive displays at the site, teacher's institutes to educate public school teachers, a traveling display, public talks, and web sites. The strikers have assisted the project's excavations as the archaeologists try to assist them by educating the general public about labor's struggles in the United States.

In this case, the knowledge derived from the excavations of the Ludlow Massacre Site is combined with a critique of the class structure and exploitative labor practices in order to build an archaeology of political action to transform the world (McGuire 2010: 223). As McGuire (2010: 231) states, "an emancipatory praxis can exist only within real contexts of social relations, struggles, interests, institutions, and agents." Praxis can only be realized through collective action, and this requires us to work in and with real communities.

Key Issues/Current Debates

In recent years, archaeologists have seriously confronted the class structure of archaeology as a middle class practice connected to modern capitalism. Challenges posed globally by indigenous peoples and descendant communities have forced archaeologists to face a larger network of social relations in the context of their research. US archaeologists have certainly risen to the challenge since NAGPRA was passed in 1990 and the African Burial Ground galvanized descendant communities in New York in 1991. Since then, archaeologists have scrambled to engage various descendant communities in a dialogue that seeks to move beyond archaeology's colonial heritage and instead engage in community or collaborative work. As noted above, working with descendant communities (however defined) has become key to both Critical Theory and praxis approaches to a critical historical archaeology. Collaborating with descendant communities is rapidly becoming the norm in Historical Archaeology. Notable examples of this kind of public, collaborative project include Carol McDavid's (2002, 2010) work at the Levi Jordan Plantation, the New Philadelphia Community Archaeology Project (Shackel 2011), and, of course, the African Burial Ground (LaRoche and Blakey 1997).

While these are exciting developments, archaeologists need to be aware that simply being aware of multiple interests in the past and collaborating with community groups does not necessarily result in a critical historical archaeology the way it has been defined here– that is, one based on critique of the structures of capitalism and geared toward political action to change them. Stottman (2010: 8) contrasts public and applied archaeology which collaborates and considers the public as stakeholders with an activist archaeology. In his view, "archaeologists can do more than collaborate with communities and the public, they can use archaeology to *affect change within an activist agenda*." (Stottman 2010: 8, emphasis in original). A great deal of public, engaged, or collaborative archaeology runs the risk of falling into the trap of sentimentality when dealing with communities (Little 2010: 158). The question that archaeologists often fail to answer is what the ultimate goal is: archaeology or collaboration for what end? While historical archaeologists have become more comfortable with the idea that our work is always political, we have not been as clear in defining what that political agenda is or should be. Phrased another way, if the goal of praxis or an activist approach is to affect change, we have seldom articulated just what kind of change we mean. One notable example is the work of Larry Zimmerman and his colleagues on the materiality of homelessness. Zimmerman et al. (2010) argue that this work must be political and geared toward translating our archaeological knowledge into practical applications to solve real problems of social relevance (Zimmerman et al. 2010: 445). Their research has increased visibility of the problems of homelessness and has provided valuable data that can help to develop better ways to provide aid that homeless people can actually use. As Little (2010: 158) makes clear, "we must be vigilant and continually self-critical and questioning about the types of changes we advocate." And this reminds us that without a clear political agenda, our best intentioned activist archaeologies can

easily descend into sentimentality and the self-delusion that we are engaged in change while accomplishing little more than supporting the status quo.

Future Directions

All of the approaches discussed here reject the possibility that archaeologists objectively recreate the past. Once any truth claims are laid to rest, the next question must deal with what archaeology is for. Most answers revolve around some utility for the present. All of these approaches entail a dialectic interweaving of past and present and embrace the fact that archaeology is always imbricated in politics. The differences in these approaches are all minor and can largely be characterized by starting point. Critical theorists frame their work around exposing aspects of the dominant ideology that serves capitalism while a praxis approach uses class as the entry point to analysis of capitalist social relations. Collaborative approaches and work with descendant communities is an important aspect of both.

Given that these approaches are all framed in the rejection of objective truth, it is interesting that there seems to be a quest for the "right" way to do this. Instead of an either/or, best/worst approach to engaging in a critical historical archaeology, it is important that archaeologists think much more critically about notions of scale in this work. Leone's early work has been instrumental in making us realize the ideological structures of the larger capitalist system. There is real value in the critique of capitalism's taken-for-granted ideas that are the hallmark of Leone's Critical Archaeology. Since few topics have elicited as profound "ah ha" moments for students, it is hard to agree with his recent statements that "Critical Theory doesn't work" (Leone 2010: 152). However, it is equally true that this "consciousness" alone cannot change the gross inequities that define our world. The smaller scale or local level may be a more effective and satisfying scale for our critical historical archaeologies, but it is imperative that archaeologists be just as cautious about work with descendant communities. The danger is that by turning to work only with local communities, the political nature of critical historical archaeology is often lost, as is any larger sense of what the struggle is against and for.

Critical Theory in Archaeology

Michael P. Roller[1], Amanda Tang[1], Jocelyn E. Knauf[1,2] and Mark P. Leone[1]
[1]Department of Anthropology, University of Maryland, College Park, MD, USA
[2]National Museum of American History, Smithsonian, Washington, DC, USA

Introduction

Critical theory calls on scholars to view the past and the present as locations of nuanced ideological negotiation. Critical theory, as used by archaeologists, explores the relationship between our knowledge of the past and the context of its production. It urges scholars to question who they are working for and the ways in which their interpretations can be used in the present. One of the major concerns in critical archaeology is the way that conflict and contradiction have been hidden or masked through the ideology of those who are producing the knowledge. A critical archaeology calls for extricating or recontextualizing interpretations of the materiality of past social worlds from cultural to ideological capacities. Foundational to this is the recognition that power permeates nearly every aspect of social and material life ranging from broader hierarchical structures to intimate everyday practices (O'Donovan 2002). The relationship between power and ideology is invested in social practices, and these exist along with a material world endowed with the power to produce, reproduce, and maintain them. These relationships have material correlates and can be examined archaeologically. Critical theory also involves exploring the point of view from which interpretation is constructed (Leone et al. 1987: 284).

The manipulation of the past has been documented in many studies over the past several decades. It is clear that representations of the past are not inconsequential and that they shape peoples' identities and perceptions of others. Critical archaeology recognizes that the meaning of archaeological materials is not natural or immediate and that the social relationships between people and things give objects their meaning. Through exploration of the ways in which archaeological materials come to be associated with particular meanings, critical theory urges archaeologists to question common sense claims or traditional interpretations that have been made about the human experience in the past. Critical theory in archaeology also urges the examination of fundamental beliefs and guiding structures in the contemporary world and present practice of archaeology. Archaeological materials, through the framework of critical archaeology, can be considered to represent ideologies that are invested with power because they are embedded in particular historical constructions. Interpretations of

history have salience to present conditions because they can help to justify exploitative relationships and naturalize them, thereby supporting the maintenance of the status quo. Archaeological interpretation of history is therefore a battleground for political life and ideology in the present. A critical archaeology questions the relationships between objects, social relations, and meanings by historicizing the process of history and meaning making, challenging its immutability, or offering or illuminating alternatives.

Definition

Critical archaeologists have demonstrated that present ideologies play a significant role in the process of interpreting the archaeological remains of the past. Artifacts and other archaeological materials are open to multiple readings, each of which is based on ideologies related to what they mean, what meaning is, and how the world works. Everyone carries these implicit beliefs, and the goal of a critical archaeology is to expose these ideologies and question them. Althusser (1971) describes ideologies as the taken-for-granted things, the things that go without saying, and the naturals for a given society. Through study of the functions of ideology, scholars have attempted to show that unequal social relationships are integral to the reproduction of social order and sustain systematic inequality, sexism, and racism. Critical archaeologists examine the ways in which the practice of contemporary archaeology has contributed to the reproduction of the social order and aim to develop an archaeological perspective that is conscious of the power of archaeology to contemporary life. They seek to identify and demystify contemporary ideologies and work with the recipients of archaeological knowledge to build greater social consciousness.

Conceived as an emancipatory project, critical archaeology aims to bring an understanding of ideology in order to foster new understandings of, challenges to, and a reimagining of present society. Since critical archaeologists question the ideologies that stem from noncritical readings of history, the relevance of archaeology toward the general critical inquiry becomes clear. Archaeology can do more than describe past lifeways; it can also show that the roots of modern society are arbitrary and not inevitable. From the perspective that archaeology can use history to critique our modern world (Leone et al. 1995), it can be understood how the taken-for-granted notions in a society came to be that way. The focus of most work has been on modern capitalist societies and investigations that reveal how life was before the definition of the modern individual, time discipline, wage labor, and advanced capitalism.

Historical Background

Critical theory is most commonly associated with the work of the Frankfurt School of Social Research, established in 1923. The development of critical theory, and its retooling of classical Marxist thought, is associated with two social currents of the early and mid-twentieth-century Europe. Scholars of the Frankfurt School including Adorno, Horkheimer, and Habermas, along with other European scholars including Benjamin, Lukacs, and Althusser, turned their attention toward the functions of ideology and culture and the roles they play in perpetuating the status quo. These European scholars, while diverse and sometimes divergent in their ideas, established an influential program of Marxist-oriented, interdisciplinary social research, known as the critical theory.

First, in the wake of World War I, capitalism's goal of building a modern, rational society, with economic, scientific, and technological advancement at its foundation, was being called into question. Second, Marxist theory had been circulating in Europe for decades but had failed to bring into existence the sweeping revolutions and socialist republics that the central premises of Marxism were based upon (Kellner 1989). By the second quarter of the twentieth century, the countries of Europe were turning toward fascism or nationalist-chauvinism, often with the support of their working classes, who had turned away from socialist revolution. Critical theorists devoted their study to analyzing the material and

ideological contexts, and psychoanalytic personalities, of a modern industrial-capitalist society which could drive its citizens to sometimes act against their own best interests. Critical theorists departed from the classical vocabulary and conceptual core of Marxism while remaining committed to work within the tradition by identifying with many of its approaches and analytic premises. To this they added the vocabulary of psychoanalysis, nesting an account of individual subject formation within a broader sociological analysis of political, material, and economic structures. Their thought emphasizes the role of ideology and culture, not the economic base of social organization, as fundamental to the creation and maintenance of exploitive social relations. In the early twentieth century, they turned Marxist attention toward consumerist commodity culture (Kellner 1989).

Critical theory emerged in archaeology in the 1980s, along with other forms of postmodern thought that challenged claims to objectivity in interpretations of the past. Its use in archaeology was initially influenced by ethnographic studies of historical museums (e.g., Wallace 1981), which pointed to the fact that the distinction between past and present was being blurred in these presentations. They suggested that the role of the curator in the presentation of history was removed, depicting prehistory and history as evolving unattended into an improved present. In contrast, the critical effort examines how knowledgeable social actors exist in and move through their past and present social contexts. At this time, critical ethnographers began to generally examine taken-for-granted realities and look at the way that cultural mechanisms assure social harmony and conformity through the employment of organizational rules, norms of interaction, institutional practices, and ideological concepts. They suggested a reflexive approach, which was concerned with what was communicated as researchers worked from the present to the past, instead of asking how we got from the past to the present. Critical theory came to the consciousness of archaeologists due to a variety of factors including a recognition that archaeology was being used to serve political aims. This came out of a growing controversy in archaeology over ownership of cultural artifacts and human remains and control over the preservation and interpretation of the past (Leone et al. 1987: 284). As processual archaeology gained popularity in North America, many of the supporters of the New Archaeology began to express concern for the social relevance of archaeology through the nationalization of historical sites. This is exemplified in the work of Russell G. Handsman and the American Indian Archaeological Institute (1981), which analyzed the formation of nucleated villages as part of the rise of urbanization and capitalism in New England. Handsman brought attention to the ways in which ideas – including the ideas of the individual, wealth, and the relationships between people and objects – that have distinct historical origins within distinct social structures and processes come to be taken as part of the natural social and physical landscapes by historians. Handsman argued that modern historians were projecting modern categories onto the past and conflating modern people with past people. Alison Wylie (1985) also examined the ideological role that reconstructions of the past based on archaeological evidence played in everyday life. Leone et al. (1987) set out the goals for a critical archaeology in which research was explicitly designed to have political impacts in the present (Palus et al. 2006).

Through its attempt to historicize facets of contemporary ideology, critical archaeology helps to question naturalized connections between the events, structures, and processes of the past with the present. At the same time that critical archaeology was being developed through historical archaeology in the United States, a reaction against processualism that espoused similar but more radical principles regarding the epistemological foundations of the discipline was being developed in England, particularly through the work of Shanks and Tilley (1987). Shanks and Tilley called attention to archaeology as a political practice and urged archaeologists to acknowledge that they are working in the present, for the purposes of the present (Palus et al. 2006). Archaeology has an interesting dual nature in that its data, before interpretation, is vulnerable to very different ways of application, either through the

incorporation and perpetuation of racist, sexist, and nationalist agendas or to counter popular mythologies and support critical reexamination of these agendas.

Key Issues/Current Debates

As a reflexive approach with a goal of emancipation from coercion – including that which is self-imposed – critical theory has been successfully applied in the fields of law, history, the decorative arts, literature, geography, museum studies, and the philosophy of science, among others. Critical theory applied to archaeology – critical archaeology – is based on ideas from Althusser and Lukacs. From Althusser (1971), archaeologists understand that ideology can be discovered and that it is tied to the material correlates of past societies. And when ideology is made visible through critical analysis, Lukacs (1971) suggests that we attempt to write the history of ideology or the history of bias, identifying the mystifying relations behind modern ideologies. By giving a history to contemporary ideology, critical archaeology helps to disassociate the events, structures, and processes of the past from their naturalized connection with the present. According to Russell Handsman (1981), a critical archaeology writes histories that show and explain structural continuities and cultural discontinuities and interrogates the relationship between the present and the past. Critical archaeologists argue that modern ideologies can be challenged as arbitrary and contingent on specific circumstances of social relations. This can be done by contextualizing the origins, or history, of these practices in discrete social forms and exploitative circumstances as these existed in the past. Since its introduction to the field, critical archaeology has expanded these ideas to study the relational negotiations of class, race, sexuality, age, ethnicity, and gender. Much of this work has been influenced by Giddens and Foucault, and critical archaeologists have focused on shifting social relationships and behaviors instead of relying on static, essentialist categories.

The goal of critical archaeological work is to avoid creating self-justifying or ex post facto metanarratives by conducting careful analyses of archaeological materials using inclusionary, local histories (Schmidt and Walz 2007). The point is to understand the relationship of these identifying factors as tied to ideology as well as in relation to one another without mistakenly overemphasizing any one as causational or isolated. To study the negotiations of these identities in the past is to study inequalities and the genealogy of ideology which created and sustained them. Critical archaeology recognizes that structural inequalities are created and reproduced through ideological narratives of the past. This ideology consists of illusions, seemingly natural, timeless, and placeless, that mystify exploitive conditions that are ultimately local and particularistic. In every locality, the past serves as a site of ideological struggle. Because of this, it is concerned with memory and representation. Memory is argued to be necessary to understand society and control the future. Therefore, as an archaeologist, knowing the past and having the power to create a genealogy or speak to origins equates to the power to control. Genealogy is a political necessity and serves as an enduring form of polemical discourse (Shklar 1971), so critical archaeology becomes a tool to subvert ideologies by using material culture to make criticisms concrete, understandable, and testable. Critical archaeology recognizes that its public activities, like all scholarly endeavor, operate as socially constituted agents with claims to authority over knowledge of the past (Castañeda and Matthews 2008). The responsibility of this position has resulted in an effort to form a praxis that mitigates, or maximizes, the effect of political critique in the present. This effort has theoretically been guided by the work of Lukács and Habermas. The work of Georg Lukács (1971) identifies the central importance for every critical scholarly endeavor to create an emancipatory consciousness among its audience. He does not, however, offer a model for how to proceed with this.

The work of Jürgen Habermas (1984) enables a way of imagining what the actualized goals of a critical archaeology might look like. Habermas emphasizes the significance of standard speech acts and dialogues where the voices of subordinate groups are unheard in the practice of

everyday life. An ideal dialogue for Habermas exists where the voices of all parties are heard equally without being filtered by social inequalities so that a more equal negotiation can occur. In archaeology, this is especially crucial because competing interests frequently concern meanings assigned to the past. One of the key contributions of critical archaeology has been to introduce archaeology into public arenas (the media, museum exhibits, and interpretive programs) in new ways and to consider a responsibility to public audiences as a constituency for archaeological studies.

Public archaeology is one of the most accepted applications of critical thought into recent archaeological theory (Palus et al. 2006: 92). Public-oriented, community-based, and collaborative archaeology projects function as experimental approaches to linking critical thought to archaeological practice. While methods vary, at their core, these approaches embrace political activism as a primary goal. All attempt to use interaction with the public to enhance this role. Working with communities with histories of ideological struggle illustrates one way ideology can be subverted or resisted in the present. In the process, they challenge monolithic, sanitized, or homogenized histories with the possibility of alternatives (Leone et al. 1995). Many scholars collaborate with politically and socially disfranchised communities to define research that maximizes its benefits (Colwell-Chanthaphonh and Ferguson 2008; McDavid 2011). Others use ethnographic techniques to understand past and present social groups in an effort to enhance the effectiveness of making connections to contemporary inequalities (Shackel and Chambers 2004). All these approaches vary as to the degree or type of accommodation or intellectual engagement scholars take with the diversity of groups that make up the "public" audience of archaeological work.

Centrally, it is recognized that an unrelenting political activism coupled with self-reflexivity defines research that sustains an effective social critique. Notwithstanding the positive directions of this movement, however, it can be questioned whether it has brought the intended level of social commentary or analysis. Some scholars contend, however, that public involvement alone does not guarantee archaeological work is effectively critical or politically activist. Sayer argues that a critical project does not work in the absence of a revolutionary praxis which takes confident responsibility for its professionalism and unrelentingly problematizes the parts of society responsible for injustice (Sayers 2015). Nonetheless, the application of critical thought implies a central importance for archaeology to make contributions to public political and social consciousness through its research activities. Exploring these modes of interaction reinforces and enhances the recognition of these social roles as central to archaeology among both the public and researchers.

International Perspectives

Globally, critical archaeology confronts political and economic power relationships – historical and contemporary and local and global – that have determined or guided our present understanding of archaeological pasts. Archaeology has operated globally for nearly a century now, embedded within the structures of political discourse. A self-reflexive postcolonial turn in the scholarship of related disciplines of anthropology and history has influenced a reckoning among global scholars of the role archaeology has played in colonial projects (Croucher and Weiss 2011; Lydon and Rizvi 2010). Archaeology arose as a science alongside other aspects of enlightenment philosophy including the study of natural and cultural history. As such, it is entangled and embedded within the growth and spread of modernist ideologies including capitalism, colonialism, scientific racism or Eurocentrism, and nationalism. The global spread and local integration of these "haunts" has become, as Charles Orser (1996) suggests, the primary research interest of the historical branch of the field. As a component of this, a critical global postcolonial archaeology today attempts to examine local alternative, peripheral, silenced, or prior histories to the broad narratives of modernity as a critical project.

As an effort to promote and explore a self-reflexive, politically conscious exploration of the uses of the past, critical approaches can be seen as an effort to disentangle the complex relationship between representations of the past and the development of, for example, constructed nation-building archaeological histories. Archaeological material is particularly susceptible to political manipulation because of the way it can be appropriated and reproductively employed for political purposes as heritage, patrimony, and consumerist destination. In its history of functioning within governmental structures, archaeological research has served to facilitate the selective remembering, forgetting, or constructing of historical traditions. With its power to influence or challenge written historical accounts with novel material evidence, archaeological evidence has proven invaluable in this capacity, establishing the authority of competing or conquering groups by shaping continuity or discontinuity with a particular historical era or movement. The appropriation and preservation of archaeological sites can serve to invent or subvert heritage in ways advantageous to dominant groups, excluding those on the margin. In such cases the formalization and governmentalization of historic preservation can serve to promote, diffuse, and maintain the authority of a nationalist ideology.

Postcolonial or decolonialized approaches to the colonial past deconstruct or problematize monolithic or simplified narratives of the materialization of the "haunts" of capitalism, colonialism, and modernity in local contexts (Croucher and Weiss 2011; González-Ruibal 2008; Pezzarossi In Press). In keeping with the self-reflexivity of critical approaches, postcolonial scholarship operates "in dialogue with the present," considering archaeological history as a toolbox of themes and narratives to imagine alternatives and enact social justice in the present and future (Croucher and Weiss 2011: 2).

One large intervention in historical narrative is to challenge the direction, totality, and spatiality of colonialism, namely, its traditional focus on the Atlantic world and the diffusion of materials, identities, and influence from the European metropole to peripheral sites (Leone and Knauf 2015: 7; Lydon and Rizvi 2010; Croucher and Weiss 2011). A major result of this intervention is a radical multiplication of the possible contexts, conceptual themes, and geographic and temporal boundaries within which the field is practiced.

Future Directions

Walter Benjamin famously wrote that "To articulate the past historically does not mean to recognize it 'the way it really was.' It means to seize hold of a memory as it flashes up at a moment of danger" (1970: 257). Loosely connected to the Frankfurt School of critical theory, Benjamin has recently grown in stature as a thinker with important perspectives on the production of history, political activism, and material culture. Namely, Benjamin provides invaluable insight on the relationships between the politics of the past and present. In his time, he recognized the instability of all historical narratives which, he concluded, are always composed out of the juxtaposition between the past and present. As each era ushers in its own political threats, critical archaeologists should identify the specific historical precedents which may serve as the appropriate medium to reflect upon the exigencies of the present. Moreover, through this exercise, archaeologists can recognize and appropriate past means of resisting these political threats. Essentially, Benjamin urges us to be attentive to the fact that democracy, equity, and tolerance are moving targets which must be pursued with constant vigilance and innovation. At the same time, critical thinkers must remain attentive to the epochal cycles of oppressive power and be wary of the capricious nature of scholarly fashion.

Apropos of Benjamin's notion, awareness of new threats to our present democracy has revealed heretofore hidden *longue durée* histories of past oppression. In response, there has been a flourishing of new foundations for critical thought beyond traditional Marxist or Marxist-influenced scholarship. Some of this work developed in parallel or branching rhizomatically from the interventions of postcolonialism – eschewing an overdetermined or overly simplistic appraisal of

the monolithic "haunts" of modern history: capitalism, colonialism, heteronormativity, white supremacy, patriarchy, and class struggle – to focus on situated regional or thematic actualities or materializations. Some of these critical strands are influenced by the insight or reappraisal of well-established, but ever-changing, bodies of knowledge including Marxist-influenced strains, but also feminism, gender studies, peasant studies, and black vindicationist scholarship. Others are new to archaeology. More than simply cultivating comfort with decentered critical scholarship, this work often takes up the perspectives of positionality in history as a rich foundation for novel criticism and creative resistance including scholarship framed by postcolonial, decolonized, or global histories of capitalism (Croucher and Weiss 2011; Leone and Knauf 2015; Lydon and Rizvi 2010; Pezzarossi In Press), queer studies (Blackmore and Springate 2018), animal rights (Sayers 2014), and black feminist archaeology (Battle-Baptiste 2011). Among the pivotal contributions of this scholarship to critical archaeology is the materialization of a multivocal and multivalent critical scholarship as a source of strength in ensuring the plasticity and breadth of resistance needed to challenge the "moving targets" of oppression.

Recent scholarship has similarly questioned traditional definitions of capitalism as a bounded, or spatially consistent, object of analysis. Rather, scholarship of capitalism has re-envisioned it as a continuously evolving set of processes or systems, albeit with material components observable in the archaeological record. On one scale, this reconceptualization has brought into focus the need to challenge our most basic methods or narratives of history making (Dawdy 2010; González-Ruibal 2008; Wurst and Mrozowski 2014; Leone and Roller in press). If capitalism involves ever-changing, elusive processes irreducible to a consistent conceptual center, where can critical archaeologists find the Real among the flux? Working out of a psychoanalytic tradition, social theorist Slavoj Žižek (1989: 191) suggests that waste, ruins, peripheral places, and the precariously un- or underemployed are both the realities and the products of this process: "...the Real is at the same time the product, remainder, leftover, scraps of . . .symbolization, the remnants, the excess which escapes symbolization and is as such produced by symbolization itself." Such a perspective leads critical thought to seek out peripheral places, people, and concepts not as an anthropological exercise at documenting marginal statistical outliers but in understanding the destructive processes at the very center of capitalism. This is the Real, which is truly material and concerns the nature of exploitation in capitalism.

In rejection of archaeology as reinforcement or confirmation of ideological integrity, recent critical traditions in archaeology worldwide focus on suppressed or forgotten aspects of social, political, and economic history, bringing attention to the contradictions of modernist progress: capitalist excess, violence, under- or unemployment, environmental ruin, and political inequality (González-Ruibal 2008). Research on subjects such as sites of early primitive accumulation, maronage, industrial ruins, environmental disasters, mass graves, the traumatic passage of migrants, concentration camps, and detention centers all point to these absences in memory and accounting. Some of this research is focused on recent history rather than distant mythologized pasts, proposing these undertheorized eras as more appropriate or poignant parables for the present and challenging the distance society places between comfortable remote pasts and the ambiguously detemporalized present. The importance of understanding with nuance the regionalized differences among those resisting, peripheral to, excepted from, preceding, or fleeing from capitalist processes is of great importance to tracing the *longue durée* of the evolving dimensions of capitalism in the past, present, and future.

Critique of Romanization in Classical Archaeology

Vladimir D. Mihajlović
Department of History, Faculty of Philosophy, University of Novi Sad, Novi Sad, Serbia

Introduction

During the 1990s, archaeologists and historians of the late Iron Age and Roman period sparked discussion on the concept of Romanization which was an omnipresent and predominant interpretational framework in the Roman studies of the Western academic tradition. Scholars such as Martin Millett, David Mattingly, Jane Webster, Richard Hingley, Greg Woolf, Nico Roymans, Ton Derks, Nicola Terrenato, Benjamin Isaac, Peter Wells, and Colin Haselgrove (to name just a few) started to reconsider traditional approaches drawing inspiration from postcolonial intellectual waves and processual and post-processual archaeological paradigms. Primarily, they have addressed previous academic favoritism of the Roman side within simplistically and ethnocentrically conceptualized binary opposition of "Romans" and "barbarians/natives." This black-and-white perspective was constituted within the context of nineteenth- and twentieth-century European imperialisms and colonialisms, accompanying centrist worldviews, and related reflexive relationship the Western world had toward the Roman past/heritage. The initial critiques, coming predominantly from the United Kingdom, pointed out the biased nature of the concept, deconstructed its value-laden epistemic background and ideological context, and introduced new theoretical and methodological possibilities for interpreting the Roman and related worlds. These initiatives were further spurred by Theoretical Roman Archaeology Conference (TRAC) whose annual activities and volumes (available at www.trac.org.uk) contributed to the enlargement of the debate by including ever-growing number of academics and topics. The evolution of the Romanization critique was successively expanded further as discussion gradually spread outside the United Kingdom and affected cognitive spectrum of individual scholars and academic circles of different "national schools" of Roman archaeologies (Hingley 2005, 2012; Hingley in Versluys 2014). All of these processes unfolded into very dynamic international "ideas-exchange market," not only among the Romanists of different trades (archaeologists, historians, art historians, philologists) but also through engaging with various other disciplines (anthropology, literature theory, sociology, science). However, because of the fluctuation within the theme, its patchy character in general, and the varied status it enjoys within particular academic contexts, the definition of critique(s) of Romanization, together with designation of its overall features and clear path of development, is difficult to grasp and hard to provide in the form of compact unilineal narrative. As with any "work in progress," critique(s) of Romanization is diversified and (apart from elemental ideological ground) could not be easily restrained to homogenous and universally valid set of features. Hence, one should always keep in mind that the following survey is an outline constituted from unavoidably selective and subjective perspective/experience, which stands as one of many possible ways to write about the topic.

Definition

A critique of Romanization in classical archaeology (CRCA in further text) could be defined as a heterogeneous set of diverse interpretative frameworks that consider the effects and processes which took place in the course of the emergence and existence of the Roman imperialistic structure. Since these processes were traditionally comprehended and explained by the concept of Romanization, which is considered here as one-dimensional (ethno-cultural) and one-directional (Roman to native) simplification of much more complicated realities, the CRCA could be regarded as a group of different perspectives sharing a common ground of discontent and rejection of the long-established (nineteenth–twentieth centuries) reductive academic views on the character

of "Roman culture" and its influence on provincial populations. The initial criticism that was articulated during the 1990s addressed several key problems of traditional paradigm which are possible to epitomize as the role of the ancient written sources in the constitution of modern interpretations, the (mis)understanding of the interpretational potential of archaeological material, the ideological provenance of Romanization as a concept, and the question of the alternative theoretical approaches (Hingley 2005, 2012; Mattingly 2011). All of these assessments were linked to the wider contemporary discussions and theoretical problematization within archaeology, but they had specific manifestations inside the Roman studies due to the field's immanent peculiarities.

Thus, the so-called terror of text was an inherent feature of classical archaeology because the full confidence in and acceptance of worldviews derived from the ancient narratives completely colored all interpretations of Greek, Hellenistic, and Roman periods. Since the literary and epigraphic evidence had absolute priority in historical/archaeological reconstructions of the ancient era, the focus on their content dictated the form and nature of academic interests/questions, simultaneously marginalizing the topics absent from the written accounts or diminishing the need for development of interpretative paths which are not based on reliance in classical narratives (Laurence 2012). Directly reflecting this perspective is the second basic feature of CRCA – the question of the testimonial potential of the Roman period material data. In the context of giving interpretational priority to the written narratives, archaeological material mainly played a role of illustrating the conclusions and reconstructions formed by historiography or else providing nice pieces for museums and private collections. "Ordinary" or "small" finds of no material or esthetic values, on the other hand, were seen as convincing proofs of uniform character of normatively imagined "Roman culture" wherever it "spread" with the imperial conquests and political power. They were thus recognized merely as indicators of native populations' transformation into the Romans by "inevitable" surrounding to the lure of "superior" cultural form, whereas the artifacts retaining pre-Roman features were seen as symptoms of sociocultural conservatism and stagnancy. To put it simply, Roman archaeology of the nineteenth and twentieth centuries was dominated by the historiographical approach and archaeological perspective characteristic for the culture-historical paradigm (Laurence 2012).

Of course, both ancient written accounts and material remains were interpreted with the help of the general ideological and intellectual trends current in the nineteenth and better part of twentieth century, which were intimately linked with undisputed, deeply rooted, and often unconsciously reproduced beliefs such as Eurocentrism, sociocultural evolution, racial division of humankind, nationalism, progress, superiority/inferiority of cultures, "natural right" of "superior" populations to dominate "inferior" ones, and civilizing missions (Díaz-Andreu 2007). Since the majority of Western academics evaluated classical antiquity by reading the norms of their own culture back into the past, and due to self-identification of modern European societies with "advanced" ancient civilizations, Romanization implied cultural superiority of the Roman Empire that supposedly brought progress to native ("barbaric") cultures. Because all of the abovementioned concepts are markedly value-laden and prejudiced, their application to evidence from the Roman past (whose analytical potential was already problematically conceived) boosted and perpetuated distinctively partial (European/Western) interpretations. Therefore, with an increased awareness of the very specific character of ancient written sources as the material of highly biased conceptual nature, limited and selective content, and peculiar operational logic (both in terms of creation and utilization), CRCA started to dismantle long-lasting essentialist premises derived from ancient narratives. Simultaneously, it also began to employ a variety of new possibilities developed for the interpretation of material datasets and to question ideological inheritance constituted in the context of Western imperial and colonial projects. All these interdependent and parallel realizations finally generated the application of different theoretical positions and interpretational paths, at first borrowed from processual and post-

processual "movements" and social anthropology but afterward directly informed by wider theoretical considerations within humanities and social sciences. To sum up, the four aspects singled out in this section as exemplification of CRCA's initial phase can be seen as its fundamental elements that remain central issues in the field to this day.

Since there is no single correct way to define CRCA, another understanding might also be helpful. Critique(s) of Romanization can be characterized as reflexive study of local, regional, but most often national histories of ideas about the Roman Empire. It is possible to define these endeavors as the questioning, introspection, and deconstruction of basic and frequently subconsciously embedded presumptions about the modes of functioning of the Roman world. Since the majority of European archaeological traditions of the nineteenth, twentieth, and twenty-first centuries share the general ideological beliefs on how past societies worked, CRCA is to be comprehended as dealings with "singularized" (national) genealogies of enduring academic and widespread public images about the nature of the Roman culture and its impact on native populations. These overall commonalities of European and Eurocentric academic mindsets are reviewed shortly in the next section by focusing on triple-bind relation of ancient written narratives, theory of sociocultural evolution, and views on the Roman Empire.

Historical Background

The inception of ideas which characterize the concept of Romanization can be identified in the formation of so-called ancient *environmental theory* or *climatic paradigm* which argued the existence of several main climatic zones characterized by distinctive natural properties (Isaac 2004: 56–109; Woolf 2011: 44–51). This cognitive framework was present in ancient Greek intellectual setting as a means of explaining differences between people living in Mediterranean and continental parts of Europe, Asia, and Africa. The paradigm, of course, did not have a single form and a precisely fixed content but was used in many variations that shared one pivotal ideal: climate, relief, and natural conditions determined the character of groups of people, not only in terms of physical appearance and abilities but also in regard to their mental capacities and moral features. This kind of mental map operated by a centric principle, according to which lands of the Greek world were in the most favorable position, whereas distant regions were marked by distinctively hot or cold weather and associated relief and natural life. Correspondingly, the Greeks saw themselves as the most human, advanced, and superior group of people, while other populations were affected by the rough margins of the world and, respectively, barbaric, peripheral, and wild. Hence, the physical, psychological, and moral qualities of *others*, as well as their cultures (i.e., ways of life, habitation, economy, customs, knowledge, technology, etc.), were perceived as different, strange, and often in stark contrast to those of the Greeks. In other words, the ethnic and cultural alterities were imagologically construed as less human and getting closer to the animal world or mythological populations as they were more distanced, unfamiliar, and exotic to the Greek perception.

As the key ingredients of this cognitive system became commonplace in the Hellenistic scholarly world, they have also subsequently entered the imagology of Roman elites, who adapted them to serve their own needs and suit the imperialistic self-perception/promotion. Most frequently used in first-century BCE and first-century CE at the peak of Roman imperial ideology, this "commonsense anthropology" gained conspicuously Romano-centric discourse. Not only did the authors such as Lucretius, Caesar, Cicero, Vitruvius, Vergil, Ovid, Strabo, Seneca, Pliny the Elder, and Tacitus regard their capital (and Italy) as the center of the known world, but they also evaluated the populations of "barbarian" others with criteria of (geographical and cultural) closeness to their own society. The frame of reference remained similar to its Greek precursor (appearances, sedentism, habitation, economy, customs, technological knowledge, etc.), but the categorization of alterity somewhat changed due to the fact of Roman expansion, encounter with and incorporation of a broad span of different

communities. Those closer to the imagined center, more familiar to imperial elites and with sociopolitical structures that (at least roughly) resembled Roman, were regarded as more similar to the Roman society and more human/cultivated. On the other hand, those who were more different, exotic, and distant were imagined as being more wild and proportionally so as the length from the center increased and familiarity fell. In other words, there was a kind of scale of "cultivation and wildness" which revolved around the norm of other populations' greater or lesser similarity to Roman sociocultural milieu. Although there were no strictly defined stages of "barbarity," and the content and elaboration of the scheme varied, the Roman imaginarium did recognize nuanced diversity: Greeks, Egyptians, Gauls, Germans, Frisians, and Scythians were stereotyped as progressively strange or savage as geographical extremity grew and the Roman acquaintance with them shrank (Isaac 2004; Woolf 2011). In conclusion, in Roman antiquity, at least in the elite circles, there was a sort of naïve anthropology whose logic classified social and cultural differences in centric manner, having its own context and value system as a main unit of measure. This idea was also accompanied by speculations on the general evolutionary path of humankind, present since Hesiod and the most famously depicted by Lucretius. According to these views, humans had humble beginnings, living in caves not unlike the animals, using basic tools, hunting, and gathering the food. Gradually, they started to invent things and acquire knowledge, technology, and skills which led them to a life of more luxury and carelessness but simultaneously to a moral decline. The idea was relatively popular and often symbolized through the concept of eras, starting from the Golden and ending with the Iron Age. The significant point here is (some of the) ancient writers' comparison of the way of life of contemporary "barbarians" on the edges of the Roman world with primitive humans imagined in a described manner (see Evans 2008: 78–83, 149–154). Not only were the contemporary "barbarians" represented as inferior to the Roman culture and less human than its population (i.e., as geographical and cultural *others*), but according to this scheme, they also showed striking parallels with the population of the primitive temporal *others*.

There is a reason why these qualifications and logic of association sound very familiar to modern ears: it is because they have demonstrated more influence and deep-seatedness than they are usually credited for. Namely, ancient intellectual heritage did not disappear in the medieval period, but was actively reused and served as inspiration for many aspects of life, from legislation, philosophy, and history to medicine, geography, and ethnography. Starting with the Renaissance, classical works went through an accelerated revival and became the usual frame of references for nearly all academic spheres in the Western European tradition. Thanks to this omnipresence and wide circulation of the (adapted) ancient knowledge, the ways of understanding, explaining, and constructing ethnic and cultural *others* were under great (but certainly not exclusive) influence of classical tropes of barbarians as savage and inferior people. With the advance of European colonialism, ancient ethnographic inheritance was utilized as a part of the explicatory frame for the encounters with different and exotic populations of newly discovered worlds (see Hodgen 1964). Native groups of the Americas, Africa, and Asia were conceptually equalized with "barbarians" of antiquity, while their present was qualitatively assimilated with the European past. In turn, contemporary cognizance of "noble and ignoble savages" informed the understandings and evaluation of classical ethnographic *others*, which ultimately created a spiral of circular interrelationships between colonial present and ancient imperial past (Dietler 2005). Subsequently, accumulated information on exotic populations and varieties of humankind had to be systematized in some way, which happened during the Enlightenment, in the middle of the eighteenth century, with the articulation of the idea of sociocultural evolution. The ancient conceptual framework of alterity was built in the theory as its basic ideas were merged with experiences of otherness currently shaped around the colonized planet. In other words, the initial form of sociocultural evolution, with its classification/

qualification of people according to the stages of development and the principle of superiority/inferiority, was well inspired by Greek- and Roman-centric cognitive system and related assortment of human differences. Even after the publication of Darwin's theory of biological evolution, nineteenth-century scholars were still referring to ancient perspectives of alterity (e.g., Edward B. Tylor and Lewis H. Morgan), which actually means that the theory of sociocultural evolution rests on longue durée matrices of naïve anthropology generated in ancient times and reworked in the course of European medieval, Renaissance, and modern periods to suit current needs (Stoczkowski 2002).

How do Romanization and its critique fit into this picture? First, the concept of Romanization strongly relied on ancient narratives, which means it was directly exposed to and deeply influenced by conceptualization and value judgment of ethnic and cultural *others* found in them. Second, since overall *Zeitgeist* of the nineteenth century held sociocultural evolution for self-evident universal law applicable to all human societies in the past or present, the theory was abundantly employed as "objective" and independent academic groundwork for the constitution of the idea of Romanization. Thus, the concept of Romanization was influenced by the ancient discourse of otherness via two mutually reflexive but distinct lines: directly from the sources and remotely through sociocultural evolution which already contained deeply nested classical ethnographic rationale. In other words, Greek and Roman subjective mental map and "commonsense anthropology" were twice projected into the concept of Romanization making it a doubly biased interpretative framework. This is exactly why CRCA appeared and why Romanization simply cannot be taken as reliable outlook for the Roman world.

Key Issues/Current Debates

The outlined epistemological roots of Romanization were exactly what caused the first wave of critique to come from postcolonial perspective and point to its imperialistic and colonial background. From such standpoint, the concepts of *creolization*, *hybridization*, and *discrepant experiences* were proposed, suggesting much more complex picture of Roman and native interactions and taking into account the latter's active participation, resistance, subversion, and transformation of the imperial influences. These theoretical perspectives initiated a revision of passive position of indigenous/provincial population and the rejection of idea that Roman "civilization" radiated unidirectional cultural influences toward the "primitive" Iron Age societies (Scott and Webster 2003; Hingley 2012; Mattingly 2011). Consequently, the aim to "raise native/subaltern voices," covered in silence by the (ancient and modern) colonial discourses, produced a variety of works that investigate local responses to Roman power and persistence of indigenous sociocultural practices (e.g., Scott and Webster 2003). Although the authors applying postcolonial inspiration offered mutually different interpretational outcomes, they have generally succeeded in decentering traditional perspective and opened the space for more nuanced visions of the Roman world (Gardner 2013; Hingley in Versluys 2014). While this line of thought stays very important and could provide even more fruitful insights if refined through elaborated theory, the main problem remains the lack of methodology for a safe recognition of a subtle resistance (Mattingly 2011: 40–41; Laurence 2012: 67). The peril of erroneous reading the (presumed) "anti-Roman" actions/feelings into any kind of material culture or practice motivated the recent review of postcolonial critique of Romanization as being in essence and practice not post- but anti-colonial, i.e., only converting the previous idea of "Roman Empire as good" to the standpoint of "Roman Empire as bad" phenomenon (Versluys in Versluys 2014). The criticism is however not entirely justified as the "anti-colonial" discourse never became the normative, nor it had a chance to develop more comprehensively during its short period of utilization within the Roman studies (Gardner 2013; Van Dommelen in Versluys 2014). Thus, postcolonial criticism and analytical tools it offers remain quite relevant to the field, though they should be employed with considerable caution in order not to exaggerate the role of indigenous resistance and only perpetuate the

problematic dichotomy of "Romans and natives" under different names. The same is valid for potentially very useful concepts of hybridization and creolization since the imperial/colonial complexities of the Roman world could be easily reduced to black-and-white picture if they are utilized in a sense of interactions between two normatively conceived cultures with strictly defined contents/specificities (Versluys in Versluys 2014). Again, these concepts provide very rewarding lines of thinking about the Roman imperial structure and local communities but only with full awareness of their limits and explicated and clearly defined positions, methodology, terminology, and case studies.

Directly linked with the question of postcolonial perspective is the imperialistic order of the Roman world, vividly debated in contemporary academia. Indeed, this issue is traditionally at the fore of the Roman history/archaeology, while the Roman imperialism evaluated in affirmative light was a vital element of the concept of Romanization. Specifically because of this epistemic heritage and due to recent changes of perception and interpretation of imperialisms in general, investigations of the forms and practices of control still represent one of the most important concerns of the Roman studies. The theoretical inspiration and methodological devices imported from postcolonial discourse analysis, theories of structuration, habitus, connectivity, and networking facilitated much more delicate and sophisticated problematization of the Roman hegemony and its effects on overall communal settings across the Empire and beyond. It is now a widespread opinion that specific ideology (or "attitudes of mind" – Isaac 2004) and geometries of power pervaded all levels of Roman society and diverse groups within, and there can be little doubt in the existence of meaningfully structured social inequalities and their continual structuring of societal realities and relationalities. Roman imperial formation indubitably (directly or indirectly) generated transformations, re-articulations, and negotiations of social positioning wherever its impact reached, influencing everyday life and functioning of a great number of different collectivities and individuals. However, recent studies decidedly show that Roman imperialism(s) was not a stable and immutable phenomenon. Rather, it had changeable character, a variety of articulations, different levels of functioning and uneven impact on the Empire's and surrounding populations, and, contrary to the traditional belief, differed considerably (although not entirely) from the empires of the early modern age (Dietler 2005; Mattingly 2011). Although there are many and often mutually conflicting ways of how exactly to define the practices of dominance and their repercussions (Hoyos 2013: 5–10), when meticulously explicated, the concept of Roman imperialism(s) is successfully employed in relation to wide range of spheres and particular case studies: administration, institutions, relations with local elites and communities, economy, army, landscape and settlement patterns, urbanism, religion, funerary practices, art and architecture, symbolic systems, and interactions with neighboring societies (Mattingly 2011; Hoyos 2013; Gardner 2013; Janković et al. 2014; Janković and Mihajlović 2018; Gonzalez Sanchez and Guglielmi 2017). Nevertheless, any absolute evaluation of the character of the Roman sovereignty simply does not work since it was neither centrally dictated total rule of terror (although it certainly was for some) nor a world of benign welfare and absolute freedom. Symbolic and physical violence, opportunities and power gains, privileged and deprived, and winners and losers were all in the picture, producing the dynamic Empire of drastically diversified life stories (Mattingly 2011; Gardner 2013; Morley; Witcher in Pitts and Versluys 2015). Although there is a danger of "explaining all away" with higher-order generalization (some would even say truism) such as the concept of Roman imperialism is, if crossed with advanced theoretical-methodological frameworks, it certainly enables a wider grasp of the complexities and effects of the Roman imperial structure.

A critique of Romanization based on postcolonialism and different understandings of imperialism stimulated the discussion of identities in the Roman world. The problematization of the issue started with repositioning the importance of native identities but soon took on a much wider sway to encompass very different and various

approaches and topics. Generally, the researches try to employ the constructivist theory of identities in order to comprehend highly diverse ways and kinds of identifications in the context of the Roman Empire and neighboring worlds, especially taking into consideration how they were tied to material culture. The fundamental theoretical premise is that each individual engages in a plethora of associations with collectivities of different natures and levels, creating the array of social personae which are activated and lived in dependence to context. Particularly, identity studies of the Roman world tend to advance approaches for understanding in what ways were the surviving written accounts and material remains linked to mentioned basic notion and how did the individual and collective social roles and (self-)perceptions/representations change in relation to Roman imperial system. In this light, the issue of ethnicity has been the most frequently discussed (due to its pivotal part in nineteenth-century and twentieth-century scholarship), making the subject of relationship of local/regional ethnic affiliations with the Empire's social structure still ongoing (Derks and Roymans 2009). However, other types of identifications also received a substantial attention in the last couple of decades, and inquiries of ways of being Roman, status differentiations, profession, religion, gender, age, marginal groups, and ambiguous intersections of social roles produce valuable results (see Gardner 2013; Revell 2016; Janković et al. 2014; Janković and Mihajlović 2018; Gonzalez Sanchez and Guglielmi 2017). The best quality studies of these fields bring the insights from current social theory to archaeology, pointing out the situational, relational, and performative character of social positioning and trying to grasp how the identifications of the Roman world were created, maintained, reproduced, and changed through various sets of (routine and special) behaviors, beliefs, and materialities. Some of them also posed very important questions regarding the relation of individual agents and social structures/institutions of the high level, pointing to the (previously not realized enough) dialectical and very complex nature of such bonds (Gardner 2013; Revell 2016). Similarly fresh standpoint is employed in the studies of religion and underlines that individuals appropriated and lived religious experiences, practices, and ideas in many different ways which were strategic and even subversive. In this way, the socioreligious norms were not just reproduced but in the same time modified and transformed through everyday practices and interactions (Rüpke 2016). On the other hand, a large number of researches conducted so far are regrettably characterized by essentialistic utilization of the concept of identities and only wrap up the old notions (Romanization in particular) in new terminology. As with previous interpretational directions, constructivist theory of identification enables rewarding *multidimensional thinking about* instead of *two-dimensional reduction of* the Roman world but only with careful and reflective engagement with its postulates.

Recently, it has been proposed that the Roman world could be understood as a network of heightened interconnectedness and thus treated as global, which is why the theories of globalization could bring great benefits into the Roman studies. Although the concept of "globalizing Roman culture" was already advocated by Hingley (2005), it is now called for broadening of the original connotation (primarily as a frame for epistemological reflection on "hermeneutical relationship of the past and present"), to include experimental borrowing and adapting of the methodological apparatus used in the analysis of contemporary globalization process (Versluys in Versluys 2014: 15–19; Pitts and Versluys 2015: 3–25). According to this view, the globalization theories should contribute to the ending of dichotomized thinking and enable academics to leave aside binary conceptualization of the Roman world, no matter under what new name it might appear (Pitts and Versluys 2015: 8, 22–23). It has been suggested that the globalization theories also allow decentered understanding of the consumption practices in the Empire, pulling it away from the simplified notion of a single center of power that influenced provincial peripheries. In other words, economic and cultural processes in the Roman Empire should not be considered as necessarily linked to and boosted by imperialism but

as events which advanced in a less direct manner and depended on "pre-existing cultural geographies and economic systems" (Pitts in Pitts and Versluys 2015: 80). In this way, the studies of consumption of everyday artifacts and commodities are to be privileged as the approach which could reveal "degrees of global consciousness, participation and exclusion from aspects of global culture, and the general experiences of living in the Roman world for all social groups, especially non-elites" (Pitts in Pitts and Versluys 2015: 93). The discussions of such perspective include globalization of Roman visual material culture, the question of Roman urbanism as decentered globalization of local and localization of globally shared ideas of urbanity, Roman economy, mobility and ancient perceptions of their world, etc. (see case studies in Pitts and Versluys 2015). Shortly, there is a notion that globalization theories could assist very well in research of shared cultural symbols, practices, ideas, etc. and their dynamic and fluid trajectories throughout space, time, and variety of social contexts in the Roman world.

Although the applicability of theories of globalization within the Roman studies represents a valuable and interesting approach yet to develop, and it is certainly unavoidable in the context of omnipresent contemporary ideas of globalization (Hingley in Pitts and Versluys 2015), this theoretical path is strongly associated with serious difficulties (pointed out in different ranges by all the contributors in Pitts and Versluys 2015). To begin with, the concept of "globalized Roman world" could be wrongly comprehended as an axiom with normative meaning, i.e., as a kind of cultural totality which differed only in its local manifestations but actually accommodated the same cultural essence. Most often this viewpoint does not answer the basic questions – globalization of whom, by whom, of what, how, and by which exact mechanisms – which leaves the term very unclear, vague, and all-encompassing but at the same time deterministic. Furthermore, instead of overthrowing traditional dichotomies, the globalization perspective carries a risk of disguising them with general but equally generic pair of "global versus local." Finally and most importantly, it is crucial to remember that globalization speculations are just as ideologically and value-laden as any of the concepts they allegedly challenge. The idea and theories of globalization are intensely intertwined with power relations and embedded in the Western capitalistic conceptualization of the world, as well as in the (almost unconscious and uncontested) belief in the principles of commercialistic free market, economic development, and consumerism. With this severe shortcoming, the utilization of globalization as an explicatory model for the Roman world is linked with a great hazard of masking its power relations with allegedly faceless/neutral cover term or, worse, equalizing it with our own time and downplaying the crucial contextual particularities of both (Gardner 2013; Morley; Witcher in Pitts and Versluys 2015). Thus, globalization of the Roman world could surely come handy as loose metaphor for the increased connectivity, but immediate utilization of interpretative tools and themes developed for the contemporary setting remains open to doubt.

Finally, it is necessary to single out refreshing developments inside the CRCA which are drawing from so-called ontological/material turn in archaeology, i.e., consider material sphere not just as a passive product of culture but as an active agent, in a manner professed by actor-network, entanglement, and "post-humanism" theories (Versluys in Versluys 2014; Van Oyen and Pitts 2017). Such views point out that Roman archaeology was under the everlasting comprehension of objects through instrumentalist (things as tools) and representational (things as signifiers) approach, which treated artifacts as direct representations of people or historical processes. The traditional standpoint is inherent to modernist ontological separation of humans and things and denies that objects can have agencies and meanings outside those invested in them by people. In other words, there is a fixed common belief that things cannot act outside the (humanly determined) roles of proxies for certain aspects of life or symbols for some identity categories, which is the stance that needs to be revised and abandoned. In order to successfully do so, it is invited for shifting of general questions about objects from "what they meant and were used for" to "what

they are," "what activities they allowed," and "what they did" (Van Oyen and Pitts in Van Oyen and Pitts 2017). The changed sets of inquiries open very rewarding paths of comprehending the materialities of the Roman past and their relationship with general sociocultural processes: did the respective groups of objects constituted categories; how did some types emerge; what were the trajectories (i.e., relational constellations) and influences of particular kinds of things; in what ways did specific distributions happened; how did particular bodies of objects correlate with some of the general/global social, political, and economic trends or omnipresent kinds and types of artifacts; etc. In other words, the emphasis is on what certain classes of objects did in specific contexts and how their qualities and materialities impacted the wider dynamics of relational networks built not only by humans but other nonhuman material and immaterial entities as well. This perspective adds very important and often forgotten dimension in considerations of the Roman world – various and multileveled capacities that materiality brings into the picture. The important aspect here is that mentioned approach could essentially complement and enhance the older theoretical positions such as constructivist-performativity approach to social identifications or perspectives of structuration and power relations, although they are initially evaluated as generally less insightful than the latter (Van Oyen and Pitts in Van Oyen and Pitts 2017). Nevertheless, as with any theorizing, there are certain difficulties to be aware of. First is a danger of turning in truisms and inability of coming to any conclusion beyond "things have agency." Furthermore, it is very difficult to show the agency and trajectories of things really independent of referring to social identifications and historical frameworks. These are of course inseparable, but the problem lies in claimed autonomous potential of materiality which actually leads us back to old ontological separation of humans and things. However, with the realization that we research "emerging" and "becoming" (instead of "being") through behaviors, practices, and beliefs which are indivisibly pervaded with materiality, simplified interpretational framework of Romanization or similar stances could be completely and rightfully left behind and aside, not only in terms of overcoming Romano- or Euro- but also anthropo-centric ideas about the Roman past.

International Perspectives

Despite of being initiated and developed in the United Kingdom, CRCA has become a strikingly international field of research (Hingley 2012; Hingley in Versluys 2014). Even though it spread relatively quickly to other schools of Roman archaeology (most notably the Dutch school), this tendency should not be regarded as simple outcome of the direct and unilineal British influence. Along with the pioneering works that profoundly inspired and informed individual scholars and academic circles outside the United Kingdom, one should always be aware of the local/national theoretical revisions and reconsiderations of particular relations toward the Roman past. Therefore, the scope, types, and forms of CRCA depend on the peculiar developments of regional/national Roman archaeologies and even specific academic backgrounds of individual researchers. This is well illustrated by few recent volumes which demonstrate well the general application of more advanced interpretative/explicatory frameworks but with notably unequal success and quality (Derks and Roymans 2009; Janković et al. 2014; Janković and Mihajlović 2018; Gonzalez Sanchez and Guglielmi 2017). Indeed, the "global" Roman cultural templates are not seen anymore as indicators of becoming ethno-cultural Roman but as diversified and inventive local reactions to interplays with the imperial structure. However, some of these perspectives simply substitute the concept of Romanization with undeveloped and uncritical employment of some of the novel approaches, resulting in declarative invoking of "trendy" perspectives with simultaneous keeping of highly problematic traditional matrices. Additionally, in the environments where archaeology still operates with the idea that the evidence, typology, analogies, and reliance on written accounts speak for

themselves, Romanization continuously serves as "natural" explanation of the Roman past. In spite of these drawbacks, CRCA has received wide international attention which gives it a huge potential for developing sophisticated and as-much-as-possible bias-free approaches in the Roman studies.

Future Directions

The outcomes of CRCA are already manifold and evolve further, but its future directions will be shaped both by the reflective relations between particular schools of archaeology and the Roman past and the perspectives that general ideological/intellectual Zeitgeist will have toward it. Although there are no certainties, it is highly probable that future courses will rely heavily on some of the themes and approaches which are now emerging inside humanities, not least because of the generally increased familiarization and involvement of archaeologists in contemporary theoretical flows (González-Ruibal 2013). It is important to remember that as "every generation has its way" so too has its Roman Empire, relationship with and peculiar interpretations of it features. Still, judging by actual trends of questioning phenomenology, ontology, anthropocentric perspective, and ever-growing utilization of advanced hard science analyses, it is reasonable to expect few parallel lines of progression, which will intersect, at least in some segments and the work of some scholars, to award inspirational views on dynamics and relationalities of the Roman world. Nevertheless, it is hard to expect that the Romanization-like ways of thinking will disappear completely as they are practically intact in some academic contexts and operate on very simplified logic which seems to be still very alluring.

Cross-Cultural Interaction in the Greek World: Culture Contact Issues and Theories

Thomas F. Tartaron
Department of Classical Studies, University of Pennsylvania, Philadelphia, PA, USA

Introduction

The Greeks were a mobile people who regularly interacted with a host of non-Greek populations near and far, from the Bronze Age through the historical periods. In particular, a strong maritime orientation facilitated contact with distant people and places. These interactions were both direct and indirect; peaceful and violent; purposeful and incidental; ephemeral and profoundly influential; short-lived and enduring. This entry attempts to characterize current issues and debates surrounding the archaeology of cross-cultural contact from the Bronze Age to the end of the Classical period (Figs. 1 and 2). Once Alexander and his successors initiated the Hellenistic world, an entirely new set of issues concerning Greek identity and culture came into play, which for reasons of length are not included here.

Definition

The simplest way to envision cross-cultural interaction is in terms of the movement of people from one culture area to another, but the reality is much more complex. Cohabitation with non-Greek populations at home and especially in colonies abroad provided the greatest cultural impact, but is only one of several dimensions of cross-cultural interaction. Profound innovations in language, art, and technology were initiated indirectly through the activities of a small number of merchants, craftsmen, and other travelers. We learn about these contacts through ancient texts (including prose histories; verse epics, odes, tragedies, and comedies; and inscriptions) and from the archaeological record. Durable archaeological objects are a minimal residue standing in for a diverse array of perishable and non-material products, including foodstuffs, raw material, technologies, aesthetic tastes, and cult practices. These may be passed directly from one people to another, or they may travel indirectly through a series of intermediaries. Objects and ideas are commonly transformed in function and meaning as they are transferred from one cultural system to another. To cite one example, in the Archaic period, *kouros* and *kore* statues derived from Egyptian statuary (Fig. 3) were adapted to the project of aristocratic self-definition in Greece, as dedications at sanctuaries and prominent markers on elite graves. In these and similar cases, foreign objects and ideas could assume new roles, often as elements of social contestation, once they were "domesticated," i.e., integrated into intelligible codes or systems of meaning in Greek society.

Cross-cultural interaction can be characterized along several dimensions: (1) the occasions, or *modes*, of cross-cultural contact; (2) the instigator(s) of and participants in the contact; (3) the location of the contact; (4) the material and intellectual products (goods and ideas) moved and exchanged through the contact; and (5) the ramifications and effects of cross-cultural contact. The usual modes of contact include exploration, trade, colonization, diplomacy, military action, and communal activity (such as religious pilgrimage). These categories obviously overlap in

Cross-Cultural Interaction in the Greek World: Culture Contact Issues and Theories, Fig. 1 (**a**) Map of the Mediterranean with sites mentioned in the text; (**b**) Detail map of the Aegean with sites mentioned in the text. (Base maps ©Daniel Dalet)

multipurpose travels and interactions. Exploration and trade relations for the purpose of gaining access to supplies of raw materials, particularly precious metals in which Greece is poor such as copper, tin, and gold, began at least as early as the Bronze Age and continued through the historical periods. Colin Renfrew's "modes of exchange" (Renfrew 1975: 41–43) are still useful models for the myriad locations and relationships through which trade was carried out (Fig. 4). Exploration

Conventional period name	Approximate calendar dates (B.C.)	Key events
Early Bronze Age	3100–2100	Early Cretan contacts with Egypt
Middle Bronze Age	2100–1600	Minoan palaces on Crete
Late Bronze Age	1600–1150	Mycenaean palaces on Greek mainland
Iron Age	1150–700	"Dark Age" c. 1150–850; "Eighth Century Renaissance"
Submycenaean	1150–1050	Nadir of Greek overseas contacts
Protogeometric	1050–900	Prominence of Lefkandi on Euboea island
Early Geometric	900–850	Phoenicians re-engage with Aegean
Middle Geometric	850–750	Pithekoussai settled; alphabet adopted from Phoenicians
Late Geometric	750–700	Great age of colonization underway
Archaic	700–490	Colonies reach from Spain to Black Sea
Classical	490–323	Persian Wars conclude in Greek victory, 479 B.C.

Cross-Cultural Interaction in the Greek World: Culture Contact Issues and Theories, Fig. 2 Basic chronological chart for later prehistory and early history

was also directed toward the foundation of colonies, ranging from coastal footholds to secure access to trade items, to permanent agricultural settlements. "Protocolonial" activity can be recognized already among the Minoans and Mycenaeans of the Bronze Age, a prelude to the massive experiment in cross-cultural interaction that was the great colonizing period (c. 800–500 BCE). Although the Greeks were intrepid explorers, contact was also initiated from outside, with Phoenician westward expansion making the most enduring contribution in the form of the adaptation of the West Semitic alphabet to the Greek language. Greeks and Phoenicians encountered one another in their respective homelands as a result of the impulse to trade, and subsequently in the central Mediterranean where they were both active in establishing coastal settlements and trading posts. Across the Mediterranean, networks of interaction resulted in widespread sharing of material culture, technology, and customs. While the Greeks transmitted an appreciation for their fine painted pottery and cultural practices such as wine-drinking and sympotic feasting, they absorbed iron-making technology, the decorative motifs and aesthetics of the "Orientalizing" style, and the Phoenician alphabet. Further, the crucible of colonial interaction was partially responsible for the formation of a collective, "Hellenic," identity in the Archaic and Classical periods (Mitchell 2007; Malkin 2011). In recent years, archaeologists have shown intense interest in exploring each of these dimensions, through a combination of archaeological fieldwork, laboratory analysis, and theoretical modeling.

Historical Background

In the Bronze Age, two complex, palace-based societies arose in the Aegean – the Minoans on Crete and the Mycenaeans on the Greek mainland. Both are thought to have emerged under some influence from an already established state. In the years just before the first palaces appeared on Crete, Minoan contacts with Egypt and the Near East increased dramatically, embracing not only exchanges of material culture such as scarab seals and stone vessels, but also transfer of technologies of metal and faience working, as well as the sail. Some of the structural changes in Cretan society that paved the way for the first palaces, including urbanization and administration using hieroglyphic writing and seals, may have been inspired by these contacts. The presence of Cretan

Cross-Cultural Interaction in the Greek World: Culture Contact Issues and Theories, Fig. 3 The Kroisos kouros, from Anavyssos (Attica). National Archaeological Museum, Athens. http://upload.wikimedia.org/wikipedia/commons/e/ea/Kouros_anavissos.jpg

craftsmen in the East is implied by Aegean-style wall paintings at Tel Kabri in Israel, Alalakh and Qatna in Syria, and Tell el-Dab'a in Egypt, ranging from the late seventeenth to the fifteenth century BCE (Cline et al. 2011). Egyptian New Kingdom tomb paintings appear to depict Cretans, described as "Keftiu," presenting gifts to the pharaoh (Panagiotopoulos 2001).

The rich Shaft Graves of Mycenae, which represent the first stirring of complex society on the mainland, betray strong influence from Neopalatial Crete in iconography, ceramic forms and styles, metalworking, and funerary architecture. It is often suggested that a "special relationship" with one or more Minoan palaces gave nascent elites at centers like Mycenae access to exotic materials and artisans. The influx of Minoan goods and ideas destabilized the egalitarian social structures of Middle Helladic Greece and created opportunities for social differentiation, setting into motion a gradual trajectory toward the Mycenaean palaces (Voutaski 2010).

The discovery of Mycenaean fine painted pottery at hundreds of sites from the Near East to the central Mediterranean shows the extent to which the palaces participated in cross-cultural trade networks, but the nature of those relationships is not so easy to ascertain. It is still uncertain whether Mycenaean merchants or palatial representatives actually visited all of the coastal areas where the pottery appears, rather than relying on middlemen such as Cypriots to transship Mycenaean products (Bass 1998). In Egypt, there are no certain visual representations of Mycenaeans comparable to the Keftiu depictions. At Tell el-Amarna (ancient Akhetaten, the capital of the heretic pharaoh Akhenaten), thousands of sherds of Mycenaean pottery have been recovered, but this impressive corpus is not matched by a single mention of Mycenaeans in the contemporary Amarna archives (see Hankey 1981). On the other hand, two artifacts offer tantalizing but controversial evidence for more significant relations. The so-called Aegean List inscribed on the back of one of five statue bases at the mortuary temple complex of Amenhotep III (reign c. 1390–1352 BCE) mentions more than a dozen places in the Aegean, and has been interpreted by some as the itinerary of a royal diplomatic mission. The second artifact, a papyrus fragment from Amarna dated to the mid-fourteenth century BCE, bears a painted scene in which a group of Mycenaean-looking soldiers appears to fight alongside Egyptian comrades. If this interpretation is correct, it suggests that the later tradition of Greek mercenary activity around the Mediterranean has a Bronze Age antecedent.

The poverty of Greece in a host of raw materials, particularly metals, compelled the Mycenaean palaces to tap into eastern Mediterranean networks in which copper, tin, and other metals circulated, and may have encouraged early

Cross-Cultural Interaction in the Greek World: Culture Contact Issues and Theories, Fig. 4 Graphic representation of Colin Renfrew's modes of exchange (Renfrew 1975: 42, Fig. 10)

exploration of Sicily and southern Italy. The concentration of precious metal objects in tombs and the careful control over supplies of raw metals implied in the Linear B tablet archive at Pylos demonstrate how essential they were to the Mycenaean palatial elite. The Uluburun ship, which sank off the coast of southwestern Turkey c. 1300 BCE with a primary cargo of 10 t of copper and 1 t of tin, may have been sailing toward one of the Mycenaean palaces (Pulak 2005). Few finished objects of foreign origin have been found in Mycenaean Greece, however, and the pattern of their distribution suggests that palaces had rather specific relationships, e.g.,

Mycenae with Egypt and Tiryns with Cyprus. Further, the Linear B tablets contain virtually no explicit references to long-distance trade, with the result that scholars must resort to reading ethnic identifiers ("Cypriot" persons or products; "Women of Asia" taken as slaves) or exotic commodities (sesame, gold) to reconstruct cross-cultural contact of any kind (Chadwick 1976).

The Minoans and Mycenaeans established contacts and later colonies in the Aegean islands and on the Aegean coast of Asia Minor at Miletus; the Mycenaeans pushed west into the central Mediterranean. Their extra-Aegean interventions and trading activities may have had little cultural impact, however. A contextual analysis of the Mycenaean pottery at the *emporium* (trade outpost) at Ugarit on the Syrian coast revealed that these fineware vessels were neither restricted in their circulation nor held in particularly high esteem (van Wijngaarden 1999). The Mycenaean colony at Miletus is a special exception since most scholars now accept that the *Ahhiyawa* in Hittite New Kingdom records refer to Mycenaeans, who possessed a foothold at *Millawanda*, or Miletus. The Ahhiyawa were an irritant on the western flank of the Hittite Empire, but at least for a time, the Hittites accorded the king of the Ahhiyawa the status of Great King, equivalent to other Near Eastern monarchs. This short-lived diplomatic status ended before the Mycenaean settlement at Miletus was finally destroyed in the later thirteenth century BCE (Niemeier 2003).

The Mycenaean world experienced various disturbances in the second half of the thirteenth century BCE, culminating in the final collapse and disappearance of the palatial system shortly after 1200 BCE. The causes of the collapse are largely speculative, but a complex mix of universal and locally specific, environmental and social/cultural, factors cannot be doubted (see Middleton 2010). Disruption of long-distance trade routes supplying raw materials, linked with widespread disturbances in the eastern Mediterranean, may have been one contributing factor that undermined the capacity of the Mycenaean palaces to reward loyal elites with status goods and to produce weapons and armor.

It was long assumed that the collapse of the palace system ushered in a Dark Age of some 400 years duration, but recent research has challenged the characterization of the period 1200–800 BCE as a time of grinding poverty and isolation. There was no complete break in cross-cultural communication; in the twelfth century BCE, Tiryns maintained contacts with Cyprus and Crete, and small objects from Syria, Egypt, Mesopotamia, and Cyprus were deposited in the chamber tomb cemetery at Perati on the east-facing Attic coast. Maritime activity was especially vigorous on both sides of the Euboean Gulf, where depictions of galleys were painted onto pottery (Crieelard 2006; Dakoronia 2006). At Lefkandi on Euboea's western coast, Cypriot, Egyptian, and Syro-Palestinian objects were placed in graves in the mid-eleventh century BCE. Iron technology was transmitted to Greece from Cyprus during this period, perhaps by the descendants of Greeks who fled the palatial collapse. Other descendants of Greek refugees may have formed the Aegean cultural element that is strongly expressed in the Philistine cities of the southern Levant. In the depths of the Dark Age, c. 950 BCE, Lefkandi produced a remarkable apsidal building measuring 45 × 10 m with mud-brick walls on a stone socle and an exterior peristyle of wooden posts. Near the center of the building's interior were two graves, one containing the cremation burial of a male and the inhumation of a female, and the other four sacrificed horses. The bronze vessel holding the man's remains and some of the woman's jewelry were Bronze Age heirlooms from Cyprus and the Near East. Subsequent burials in the adjacent Toumba cemetery (c. 950–825 BCE) contained many examples of bronze and faience vessels of Egyptian or Syro-Phoenician origin (Thomas and Conant 2003: 85–102). In the postpalatial period, the Cypriots pursued an active and independent overseas agenda with ties in the Levant, the Aegean, and the central Mediterranean; it is conceivable that Greeks accessed Near Eastern materials through Cypriot intermediaries. Nevertheless, sites with international contacts were exceptional and despite more positive assessments and new light shed on the Dark Age, the view from Greece was still one of attenuated contacts with the outside world by comparison with Mycenaean palatial times, and much

diminished indicators of social, political, and economic complexity. A general model that sees palatial collapse and a subsequent twilight of Mycenaean culture from 1200 to 1000 BCE, followed by rupture and depression between 1000 and 800 BCE, and finally regeneration of complex society after 800 BCE, has many adherents (Morris 2006).

The explanations for regeneration in the so-called Eighth-Century Renaissance are varied. Population growth, perhaps linked to a favorable shift to a wetter, cooler climate in the Mediterranean, is reflected in significant increases in site numbers and burials (see Morris 2009). Phoenician commercial expansion westward, driven at least in part by pressure from the Neo-Assyrian Empire, began in the ninth century BCE and soon impacted Greece. It is possible to trace early Phoenician routes and entrepôts in the archaeological record. The Tyrians established a colony on Cyprus at Kition in the second half of the ninth century BCE, followed by enclaves at a number of indigenous coastal settlements well situated to exploit copper resources and as transshipment nodes. En route to the west, the Aegean was integrated into Phoenician maritime networks, and some places became important stopovers. On a direct sea lane to the central Mediterranean lay Rhodes and Crete. After sporadic traces of contact in the ninth century, during the eighth century BCE, Rhodes imported Phoenician luxury goods (ivory, shell, gold, and silver jewelry), and workshops on the island produced imitations of Phoenician and Cypriot pottery and faience (see Markoe 2000). Crete too was visited fairly regularly by the ninth century. At the port of Kommos on Crete's southern coast, a Phoenician-style tri-pillar shrine founded c. 800 BCE, associated with Phoenician pottery of the ninth and eighth centuries, gives witness to mariners' worship and ritual banqueting (Shaw 1989). From Rhodes and Crete, the Phoenicians established other sea lanes through the Cyclades and via Kythera to the Greek mainland. These forays activated Euboean interest and initiated Greek-Phoenician entanglements that would take on increasing frequency and significance over the next few centuries. The Euboeans became prominent partners in east–west maritime trade. Al Mina, a harbor founded on the north Syrian coast c. 800 BCE, produced for the first time a large quantity and wide range of Greek ceramics, well in excess of the amounts known from contemporary sites of the Levant. To some, this distinction suggests a Greek settlement or a Greek-Phoenician foundation, but on archaeological grounds, this is unlikely, since indigenous pottery is at least as abundant as Greek, and elements of Greek domestic life, notably a kitchen assemblage, are conspicuously absent. More plausible is that Al Mina was an emporium frequented by Greek traders, who perhaps resided there on a seasonal basis. The initial exposure of Greeks to the Phoenician alphabet must have occurred in a setting of intensive interaction, either at an eastern emporium such as Al Mina or Kition, or aboard merchant ships carrying multinational crews (Woodard 1997).

Greek colonization around the Mediterranean, falling mainly c. 800–500 BCE, was the most important development in cross-cultural interaction prior to the military conquests of the Hellenistic period. The so-called Aeolian and Ionian migrations of Greeks to Anatolia's Aegean coast as early as the eleventh to tenth centuries BCE are largely the creation of retrospective traditions that served the needs of Greeks of the Persian War era and later for civic propaganda and to justify hegemonic claims, such as Athenian leadership of the Delian League (see Rose 2008). Archaeological evidence for the organized establishment of Greek colonies abroad is scant before the eighth century, but once underway, the proliferation of colonies was rapid and spread from Spain to the Black Sea.

The motivations for planting settlements beyond the Aegean must have been diverse. The perennial search for metals, focused increasingly on iron ores, encouraged early exploration, but to a great extent, Greek colonists sought new agricultural territories. Population growth may have put some pressure on land by the eighth century, but it is more accurate to say that common farmers were incrementally disenfranchised by a burgeoning aristocracy that appropriated the best agricultural land. Joining these unfortunates must have been victims of intra-elite conflict, sons shut

out of inheritance, and miscellaneous adventurers, though in later stages, colonists were formally conscripted and some method must always have been in place to ensure that the party had the necessary blend of numbers and skills to survive. Some colonial migrations occurred under threat: In the late seventh and sixth centuries BCE, the Milesians and Phocaians sent out many colonies to the central Mediterranean and the Black Sea under pressure from the Achaemenid Empire. Traditions about colonial foundations and their affairs were recorded in literature and inscriptions in the Classical period and beyond (for examples, see Dillon and Garland 2010). Many colonial forays, about which we know little or nothing, failed.

Pithekoussai, the modern island of Ischia in the Bay of Naples, is usually thought to be the site of the earliest Greek colonial foundation c. 775 BCE. The original impetus for the settlement may have been to secure access to Italian metal ores, perhaps following along with the Phoenicians, who were exploiting sources in Spain, Sardinia, and North Africa. Yet, within a generation, the population reached 5,000–10,000, according to cemetery evidence, possibly contributing to the foundation by c. 730 BCE of Cumae, a colony on the Italian mainland with far more space for agricultural expansion. Although Pithekoussai was held by tradition to have been a Euboean foundation, archaeological evidence indicates a mixed population of Euboeans, East Greeks, Phoenicians, and indigenous people (Ridgway 2000). This cosmopolitan milieu is vividly evoked by the late eighth century cremation burial of a 10-year-old boy, furnished with Protocorintian and Phoenician style pottery and the famous "Cup of Nestor," a Late Geometric Rhodian kotyle inscribed with a whimsical graffito in accomplished Euboean script: "I am the cup of Nestor, good to drink from. Whoever drinks from this cup, may desire of fair-crowned Aphrodite seize him" (Osborne 2009: 109). The reference to Nestor seems a deliberate allusion to a story in the *Iliad* (11.632–637) about a golden cup that only the old Pylian king could lift.

The western episodes in Homer's *Odyssey* are often read as metaphors for early colonizing expeditions, and can be understood in light of cross-cultural encounters. Once the action moves from the Aegean and eastern Mediterranean into the central Mediterranean, places and characters shift from the real and identifiable (e.g., Pylos, Sparta, the Nile River) to an unreal world of monsters, goddesses, and the realm of the dead. Some of the sea-tales in the *Odyssey* might reflect the imperfect knowledge of these new worlds, and fears of hostile indigenous people. Odysseus and his men repeatedly encounter natives living in incomprehensible ways, from the Cyclopes living in isolation from one another and failing to recognize the rich agro-pastoral and maritime potential of their offshore island (*Odyssey* 9.116–139), to the cannibalism of Scylla, the Cyclopes, and the Lystraegonians. False or exaggerated representations of the "other" in seafaring lore served to underscore the dangers of incipient contacts in the absence of a common language or customs.

Once colonial expansion opened up distant worlds, the effect on the Greek mainland was dramatic. New trading opportunities in the West prompted Corinth to found colonies such as Corcyra and Syracuse, and to export its distinctive painted fineware, which dominated western markets between c. 725 and 575 BCE until superseded by Athenian black-figure and red-figure production. Etruscan elites, from whom Greek merchants sought metals, became consumers of Greek pottery, aesthetics, and the alphabet. In the East, the mobility of Greek colonists, merchants, craftsmen, and mercenaries during the eighth and seventh centuries resulted in the introduction of a range of craft skills and artistic influences from Anatolia, the Levant, and Egypt to Greece. Among these were techniques in bronze working and textile manufacture, and the striking "Orientalizing" style in pottery, characterized by a new range of decorative motifs, most prominently griffins, lions, sphinxes, lotuses, rosettes, and palmettes, arranged in horizontal friezes across the body of the vessel (Fig. 5). The growth of Panhellenic sanctuaries in Greece, particularly at Delphi and Olympia, was bolstered by colonial dedications and the efforts of colonials to proclaim their Greek identity by participating in mainland communities of cult. By Classical times, general

Cross-Cultural Interaction in the Greek World: Culture Contact Issues and Theories, Fig. 5 Orientalizing motifs on a Protocorinthian olpe c. 640–630 BCE, from Corinth. Louvre Museum, Paris. http://upload.wikimedia.org/wikipedia/commons/c/cc/Olpe_sphinx_Louvre_Cp10475.jpg

prosperity and population growth in partly urbanized city-states sometimes strained agricultural resources. Athens relied to some degree on imports of Black Sea grain, and one inscription records that Cyrene, a prosperous Greek colony in North Africa, distributed a gift of 50,000 t of grain to 41 cities on the Greek mainland and islands in response to a general famine in 330–326 BCE (Tod 1948: #196). These examples merely scratch the surface of the free flow of goods and influences in all directions, but they illustrate the profound effects of cross-cultural interaction and the central role of colonization in shaping Greek history.

Warfare, and the diplomatic interactions surrounding it, introduced violent cultural encounters, and the Persian Wars were particularly pivotal in helping to define a Greek identity in opposition to a caricature of Eastern culture. Greek mercenary activity, so familiar to us from Xenophon's *Anabasis*, was a fixture of the Archaic and Classical periods (Trundle 2004).

Key Issues/Current Debates

Current discourse concerning cross-cultural contact in the ancient Greek world is best understood in the context of a postcolonial scholarly milieu. There is a pronounced movement away from Helleno-centric perspectives, including notions such as "Hellenization," toward investigating cross-cultural interactions as diverse and locally contingent encounters in which indigenous communities are active agents who, more often than not in the period under consideration, were able to selectively adopt or reject elements of Greek culture, and who negotiated their relationship with colonists. There is also a realization that in these increasingly nuanced and situational scenarios, the "Greek–native" binary is both untenable and archaeologically problematic. Much attention has been directed to deconstructing notions of identity and ethnicity, and to exploring archaeological approaches that may result in meaningful insights on cross-cultural interaction. The encounters of Greeks with non-Greeks around the Mediterranean have been examined across multiple scales, from microregions to world systems, using the language of connectivity and network analysis.

A number of theoretical perspectives begin from the premise that ancient societies did not exist in isolation, but tended naturally to interact across geographic and cultural boundaries. The late nineteenth and early twentieth century CE witnessed the final phases of European colonialism around the world; the virtual enslavement of entire nations was justified by various means, including explicit comparison with Greek colonization or the imperial expansion of Rome. V. Gordon Childe's diffusionist models of *ex oriente lux* seemed to fit the archaeological record and support the notion that human advances emanated from certain centers of enlightenment and diffused outward over time. The radiocarbon revolution of the post-World War II years appeared to

confirm a pattern of the gradual spread of agricultural and metalworking technologies from the Near/Middle East westward.

These ideas can be characterized as *hierarchical* and *generalizing*, in that they assume relationships of inequality between dominant and acquiescent partners, and they tend to work at broad geographical and temporal scales in which entire corporate entities – societies or social systems – are the actors. A natural outgrowth of hierarchical models of cross-cultural interaction was a focus, beginning in the 1970s, on *cores* and *peripheries*. A typical scenario might involve a powerful center or core seeking raw materials from a distant and comparatively underdeveloped periphery. A coherent framework for these ideas was found in the *world systems theory* (WST) of Immanuel Wallerstein (1974), which sought to explain the global emergence of modern capitalism in terms of European core states siphoning off raw materials from politically and technologically underdeveloped Third World nations. Using superior political organization and technology, these cores exploited the periphery with seeming impunity by exercising control over production, transportation, and communication. In spite of Wallerstein's own objections, WST in some form has been applied to the ancient world in the Near East, the Mediterranean, Mesoamerica, the American Midwest, and elsewhere. Whether such world systems of dominant cores exploiting distant peripheries existed in the ancient world – indeed, whether WST has a useful application in archaeology – has been sharply debated for decades. Applied to the Greek world, the existence of a proliferation of small, independent political units from prehistory to the end of the Classical period makes it difficult to speak of a powerful core able to dominate a distant periphery. A dubious holdover from Wallerstein's original formulation is the absence of agency in the periphery. The more plausible reality is that neither the foreign party, separated from its center of power, nor the indigenous community, less developed politically and economically, could impose its will forcibly; thus, some form of accommodation had to be negotiated. As a consequence, each encounter was unique and contingent upon specific local and historical process, and generalizing perspectives such as WST have been criticized as unable to capture the diversity of these cross-cultural encounters (see Stein 1999).

On the other hand, critics often fail to acknowledge that WST has been modified to better fit the circumstances of the ancient world. Nick Kardulias (2009: 54) recommends the name *world systems analysis* (WSA) to emphasize the multiplicity of theoretical approaches now assembled under the world systems umbrella, and to make a clear distinction between current applications and Wallerstein's original model. Among the refinements is the realization that "complete domination of a peripheral zone was technologically and politically impossible" (Kardulias 2009: 58); accordingly, relations are described not in terms of domination or hierarchy but as differentiation of roles in interregional economic networks. Agency is accorded to communities who are able to negotiate the terms of their peripherality. By accommodating valid critiques and riding contemporary interest in globalization, WSA emerges as potentially complementary to the study of cross-cultural interaction at the local or regional level.

Current research on cross-cultural interaction is profoundly influenced by the postcolonial critique of European colonization, which seeks explicitly to restore agency to colonized societies by examining their responses, which might include various forms of resistance to, or selective adoption of, colonial culture (Lyons and Papadopoulos 2002). Furthermore, the general concern of postmodern studies to deconstruct and fragment conventional categories has caused notions of Hellenization, in which indigenous people are passive recipients of Greek knowledge and culture, to fall out of favor as has "Romanization" for the Roman world. Curiously, however, the postcolonial critique as a modern literary and political movement is not particularly well suited to describing or analyzing Greek colonization around the Mediterranean, because it focuses primarily on the specific conditions of modern European imperial oppression and the efforts of colonized people to regain agency for their own histories. As a result, this point of view tends to perpetuate the assumption of relationships

of dominance and dependence, of static and monolithic entities embedded in asymmetric and mutually antagonistic relations, replicating Wallerstein's colonial world of cores and peripheries. Yet Greek colonization of the eighth to sixth century BCE was nothing like the British Empire, or even the Roman Empire. A few obvious differences were the absence of a nation-state, the lack of a coherent imperial strategy or "civilizing" mission, and the essential independence of the colony from the mother city (claims to the contrary were usually pressed only at times when crucial strategic imperatives were at stake, or when some advantage was to be had from a successful colony, as in the famous case of Thera from Cyrene; see Osborne 2009: 8–17). It is highly debatable whether Greek colonists of the Late Geometric to Archaic periods were ever able to dominate indigenous peoples any more than Minoan or Mycenaean colonists had before them.

An important, and vigorously debated, question is whether cross-cultural interaction in colonial settings helped to forge collective Greek identities – a sense of common "Greekness" or "Hellenicity" based on shared traits and practices in contrast to those of indigenous people. Ethnicity, or ethnic identity, has attracted the most attention, but shared age, gender, cult practice, and geographical territory are alternative criteria for the formation of collective identities. Identities are constructed, rather than inherent, self-definitions, and as such are deployed situationally and change over time. Multiple identities can and do exist for an individual or community at any given time; a Greek inhabitant of Syracuse might think of himself simultaneously as a citizen of the Syracusan polis, a colonist from Corinth, a Dorian, a Greek, and a *Sikeliote* (Greek living in Sicily) (Malkin 2011: 18–19). These cross-cutting and sometimes competing identities could be invoked strategically to fit the situation: In 424 BCE, Hermocrates the Syracusan urged representatives of the Sicilian Greek cities to place their common interests as Sikeliotai, neighbors sharing an island home, ahead of their civic and ethnic (Dorian, Ionian) identities in order to meet the Athenian threat (*Thucydides* 4.61).

Ethnicity as a special form of collective identity has been foregrounded because of Jonathan Hall's provocative thesis on ethnogenesis in Greek society (Hall 1997, 2002). Hall challenged the prevailing notion, most explicitly expressed by anthropologist Frederik Barth, that "core ethnicities" do not exist; rather, ethnic groups and their boundaries are defined *oppositionally* against the traits and practices of others (Barth 1969). According to structuralists like Lévi-Strauss, humans are mentally predisposed to this sort of binary thinking. By this definition, colonial encounters would *prima facie* be ideal crucibles of ethnogenesis as Greeks recognized their stark differences with natives and at the same time all that they shared with Greeks wherever stationed. Hall proposed, however, that in the Archaic period, a common Hellenic identity was achieved by *aggregative* means through the creation of mythical genealogies by which the traditional "sub-ethnicities" (Dorian, Ionian, Aeolian, Achaean, etc.) were subsumed under a common, fictive set of Panhellenic kinship relationships. Only later at the time of the Persian Wars did the need to unite the Greeks against a barbarian Other result in recourse to an oppositional sense of common identity composed on cultural rather than ethnic grounds: Herodotus (8.144.2) famously has an Athenian envoy appeal to multiple dimensions of a collective Greek identity on the eve of the Persian invasion of Athens: "Again there is the Greek nation—the community of blood and language, temples and ritual; our common way of life…" (transl. Aubrey de Sélincourt). Hall denied that colonization made a significant contribution to a common Hellenic identity, because the cross-cultural experience of difference forged only civic or regional, not Hellenic, concepts of identity.

Hall's specific criteria for ethnicity and ethnogenesis – common descent and place of origin – in the Archaic period have been generally criticized as too narrow (Antonaccio 2001; Malkin 2001; Mitchell 2005). Lynette Mitchell emphasizes the role of cult in ethnogenesis: In the Iron Age, when regional authority was weak or absent, communities of cult served as aggregative centers of identity formation, and certain

sanctuaries grew to regional and finally Panhellenic prominence as at Olympia and Delphi, contributing heavily to a common Hellenic identity. In at least one case, an oppositional sense of Hellenic identity was fostered in a colonial setting in the sixth century BCE. At Naukratis in the Nile Delta, a common Greek sanctuary known as the Hellenion was established on land set aside for the Greeks to build altars and temples to their gods (*Herodotus* 2.178). The genealogical construction of identity was in fact far from universally inclusive or accepted; some ethnic groups with key claims on mythic traditions were marginal or excluded, and Hall is dismissive of alternative origin myths, particularly claims of autochthony by Athenians, Arcadians, and others. Further, mythological genealogies can be seen as one of the "tools of exclusion" by which emerging aristocracies monopolized power (Tandy 1997: 141–165); just how pervasive this Hellenic identity was among the lower registers of society is questionable. Cult, language, and material culture may therefore have had broader implications for ethnogenesis than Hall allows. To another view, a collective Hellenic identity emerged in the Archaic period from the interaction of the aggregative forces of cult and kinship with the gradual process of finding difference among people who did not share Greek language and practices (Mitchell 2005: 416).

Literary sources tend to be privileged over archaeological data in discussions of identity in cross-cultural contact scenarios, but as they rarely originate from the "front lines" and are often much later than the events they describe, they require a good deal of source criticism and interpretive effort. Because the archaeological record can be equally ambiguous, there is an especial need to develop archaeological concepts and methods to explore cross-cultural contact in situ. Such a contextual approach can be applied to the study of interaction in colonial situations, or to assess the meaning and impact of imported objects and ideas, by working from the local and particular to the global and general. Several archaeologists have taken up this challenge specifically in the colonial realm. Interactions between Greeks and indigenous communities in Sicily and southern Italy have been extensively evaluated and can serve as a good representation of the contextual approach. Carla Antonaccio (2001) suggests that we contextualize each situation by examining precolonial, colonial, and postcolonial levels, with the aim of recognizing the essential features of indigenous culture before contact, the changes that occurred to both parties during the colonial phase, and how lasting these changes were. Tamar Hodos (2006) analyzed the Greek–native relationship using several material culture categories – architecture, burial customs, religious practices, consumption patterns, artistic styles, and language and writing – as proxies. Certain salient patterns emerged. Native Sicilians absorbed Greek culture, but they did so selectively. Although there are broad regional patterns in preferences for particular forms and styles, the adoption of Greek culture was not uniform either in the elements adopted or the rate of adoption – even neighboring communities showed divergent preferences. There is little evidence that they were forced to adopt any Greek practice or material; rather, they adapted Greek forms and practices to existing cultural codes of consumption. An example is the popularity across Sicily of Greek sympotic pottery, implying the adoption of wine-drinking rituals using oinochoai and drinking cups. In the late eighth and seventh centuries BCE, these were integrated into existing feasting practices and served as markers of status. By the sixth century, however, such vessels became part of funerary sets and were often locally made.

The mixing of people and cultural elements in colonial settings confounds efforts to flesh out Greek–native interaction by reference to the material correlates of distinct identities. Scholars have long sought to identify markers of identity or ethnicity, often with the implicit assumption that these are immutable and carried with a person in perpetuity. Such a "pots equal people" mentality has characterized approaches to the question of intermarriage among Greek males and indigenous females; specifically, grave forms and artifacts such as metal fibulae deposited in burials at colonial sites have been used to infer the presence of indigenous females in Greek communities. Gillian Shepherd's (2005) meticulous analysis of

grave forms, burial practices, and grave goods across Sicily prompted the conclusion that cemeteries in the Western colonies are not useful for detecting indigenous females, or more generally for determining the ethnic composition of living populations. Practices were not sufficiently universal or consistent within indigenous societies to be reliable baselines, and cultural markers, particularly material culture but also customs and practices, were simply too transferable to be stable indicia. Shepherd found that colonial communities sought to forge new cultural identities, adopting from the start practices distinct from their mother cities, but also converging over time with indigenous influences into novel cultural foundations that resist characterization in binary terms.

In these environments of intensive interaction, it has been useful to speak in terms of hybrid cultural forms in order to acknowledge the dynamism of the process and the agency of both Greeks and natives, although in some cases, hybridity does not account for cultural creations as entirely new phenomena, rather than simply as chimeras of existing traits drawn from both parties. The Sikeliote identity of Greek colonists in Sicily was a novel creation formed both by opposition – interaction with indigenous communities – and aggregation, possibly focused on the sanctuary of Apollo Archegetes at Naxos, where Greeks first landed to colonize Sicily in 734 BCE, as a common place of origin (Malkin 2011: 97–118). Unlike the process unfolding in Greece, this regional identity was defined not by ethnicity or cult, but primarily by shared geography and enacted through interaction with both natives and other colonies. When Sicilian Greeks participated in cult and games at Olympia or Delphi, their Sikeliote identity was expressed as competitive emulation with other Sikeliotai and simultaneously subsumed to a Panhellenic identity.

The colonial milieu has often been described as a "middle ground," a term coined by Richard White (1991) to designate the negotiated physical and social space, as well as the process, in which Europeans and Native Americans learned to coexist in the Great Lakes region of North America in the seventeenth to nineteenth centuries CE. A middle ground allows two participants to negotiate the terms of a mutually comprehensible world where neither can impose its will by brute force. Important to this concept are "creative misunderstandings" that arise as each side seeks to define the other in terms that it can understand, and on this basis attempts to engage in terms that the other will expect. This process allows for cooperation and adaptation while still retaining one's essential culture; an individual or group can choose to display an adopted practice when it is strategic to do so. A "mediating culture" emerges that over time may develop as hybrid or essentially novel cultural forms shared by the two parties. A community may participate in multiple middle grounds at different scales. Sikeliote Greeks interacted in middle grounds with natives in spaces connecting the coasts with the island's interior, with the other colonies in coastal regions and at Panhellenic sanctuaries, and in the latter space also with mainland Greeks. In Italy, Campania witnessed the emergence of a middle ground where Greeks, Etruscans, and local elites interacted in a nonthreatening environment to negotiate the terms of coexistence and cultural exchange. Greek mythic frameworks were disseminated, transformed, and appropriated by Etruscans and Italians, and a mixture of traditions in burial, pottery styles, and other elements of culture prevailed (see Malkin 2002).

Cross-cultural contact with all that it implies in terms of the exchange of material goods, the movement of ideas, and the formation of identity, occurs at multiple scales. Seeking a way to integrate local with regional and Mediterranean-wide dynamics, archaeologists have been drawn to the two powerful concepts of *connectivity* and *networks*. The idea of connectivity, popularized by Peregrine Horden and Nicholas Purcell's *The Corrupting Sea* (2000), explicitly aims to show that intensive local connections forming *microregions* are linked "...both internally and also one with another—in aggregates that may range in size from small clusters to something approaching the entire Mediterranean" (Horden and Purcell 2000: 123). Archaeologists

have explored network analysis as a means to operationalize the concept of connectivity by mapping the nodes (settlements), ties (connections), and flows (content of goods and ideas) that connected Greeks with each other and with the societies they encountered around the Mediterranean and Black Seas. Network analysis, drawn from physics and sociology, models the ways in which connectivity is created and elaborated, how local and regional clusters of dense connections form, and how key nodes preferentially attract ties to become network centers. Connectivity is not purely dependent on geographical proximity or even ease of travel; relatively distant centers may forge "shortcuts" bypassing nodes and clusters. Multiple networks coexist and overlap in time and space; trade networks with local, regional, and long-distance manifestations coexist with networks of kinship, cult, and so forth.

Prehistorians made initial forays into network analysis for the Aegean world with investigations of Bronze Age maritime networks in the Cycladic islands (Broodbank 2000) and in the entire Aegean Sea (Knappett et al. 2008). Malkin (2011) is the first to apply a pan-Mediterranean network approach, with the explicit proposal that the connectivity established by Greek settlements on the shores of the Mediterranean and Black Sea in the Archaic period played a fundamental role in the formation of Classical Greek civilization. Far from being peripheral or epiphenomenal (in an instrumental sense), Greek colonies facilitated the multidirectional connections through which commodities and ideas flowed, allowing Greece to prosper. The lack of a central organizing authority or logic to the Greek diaspora underscores the agency of the colonies in producing a decentralized, "self-organizing" system. Malkin (2011: 54–55) asserts that distance, not proximity, led Greeks to heightened awareness of their shared characteristics, creating the notion of a Greek Mediterranean around which Hellenic identity converged. This identity was always weak, however, due precisely to the political and geographical decentralization of the Greek world (Mitchell 2005: 418).

Future Directions

Greeks came into contact with many and diverse foreign cultures between the Bronze Age and the Classical period. These contacts, both direct and indirect, expanded the horizons of the Greek world and made a central contribution to the emergence of civilization in the Bronze Age and its reemergence in the Iron Age. Greek intervention abroad was limited mainly to coastal zones; even the larger colonies rarely expanded very far inland to annex agricultural land, suggesting that maritime orientation remained important and that indigenous people had a say in the matter. Socrates observed pithily that Greeks lived "like ants or frogs around a pond" (Plato, *Phaedo* 109a–b). Already in the Bronze Age, a distinction is apparent between contacts with the highly developed civilizations of Egypt and the Near East, and those with societies of lesser complexity in the central Mediterranean (and later the Black Sea). In the former areas, the Greeks colonized rarely but traded vigorously and borrowed ideas; in the latter regions, most Greek colonies were founded and the transmission of Greek ideas and material culture had a greater and more lasting impact. Many indigenous communities became Hellenized to one degree or another, particularly in places like Sicily, where Greek presence was widespread and prolonged. Morgantina in the interior of eastern Sicily is often held up as an example; even there, many indigenous cultural forms and practices survived, into which Greek objects and customs were adapted (Tsakirgis 1995). There were cases of genuine fusion yielding hybrid or entirely novel cultural forms; the so-called Greco-Scythian art form – if not a culture – is one instance (Jacobsen 1993). In spite of the current scholarly emphasis on indigenous agency and negotiation in middle grounds, violence did occur where Greeks forcibly seized territory or where their colonies were destroyed.

The current rethinking of colonial interaction, aimed at recovering the indigenous community and placing more emphasis on negotiation and accommodation, is a salutary trend. But work is needed to ensure that our archaeological methods

and research designs are up to the new questions we hope to address. In dynamic interaction scenarios, reconstructing identities through material culture remains problematic. Antonaccio's appeal for a diachronic, contextual approach outlines the best way forward, though we must not confuse our etic (externally defined) categories with emic (internally defined) self-identifications. The latter may only be accessible through texts, which represent however only a narrow, typically elite-oriented sample. A goal of archaeological research should be to identify middle grounds in locations where interaction activates mutual changes in the material record, and to explore their physical, symbolic, and processual dimensions.

Network approaches promise new insights into connectivity at all spatial and temporal scales, but at present, there is work to do to find a better fit between theoretical models of network behavior and the actual patterns of connectivity in the past, since human choices and rationales may be unrecoverable or seem counterintuitive to us. Geographical distance may not be essential to "small world" connections in network theory, but in human experience, real travel times, measured by distance but modified by currents, winds, safe harbors, and existing relationships, do matter. The use of Geographic Information Systems (GIS) has facilitated the visualization of countless complex and overlapping network ties, particularly because it is just as easy to map symbolic connections as actual maritime or terrestrial routes. GIS models have been used to portray realistic travel times by texturing the sea with winds and currents (Leidwanger 2011). Approaches that employ complex mathematical models to construct networks (e.g., Knappett et al. 2008) suffer from a high degree of subjectivity in the assignment of value to variables, and particularly to those that are difficult to quantify: For example, how does one arrive at the "costs" and "benefits" of maintaining links when key data such as site size, population, and carrying capacity are missing, and how are symbolic factors added to economic rationality?

Cross-cultural interaction in diverse settings around the Mediterranean played a key role in the creation and constant renewal of Greek society. There is great interest in targeting those relationships for reassessment based on newer interpretive frameworks such as postcolonial critique or social network theory. In the future, these increasingly nuanced approaches can be harmonized with traditional practices of archaeological excavation, survey, and artifact analysis to produce narratives that embrace the complex reality in which diverse individuals and communities met, interacted, negotiated, transmitted, and borrowed, and thereby changed the world of the ancient Greeks.

Cross-Cultural Interaction Theories in Classical Archaeology

Andrew Brown
Suffolk County Council Archaeological Service, Bury St. Edmunds, Suffolk, UK

Introduction

The Greek world of the first millennium BCE was one of social and cultural change, stimulated by population movement and long-distance trade that brought Greek populations into direct contact with new cultures, materials, and ideologies. In a changing, fluid world identities were negotiated and forged in reaction to new stimuli and articulated in often extended periods of cross-cultural contact. Greek colonial activity from the eighth century BCE and the emergence of various forms of overseas settlements, including the later development of the Greek *polis* as city and citizen state, brought direct interaction with a non-Greek *other* that often had divergent social and cultural norms. In turn, Greek/non-Greek and Greek/Greek interaction contributed to a growing sense of self-identity at both individual settlement and, increasingly, a broader *Hellenic* level, particularly in opposition to a neighboring Persian Empire.

Interest in the nature of these interactions and their effects on Greek culture has been a prominent theme in classical archaeology. While the central role of the Greek world has often been highlighted, academic research since the 1980s has demonstrated the nuanced nature of these interactions and the key roles played by all parties. This has produced an extensive and healthy debate focused not only on the intricacies of interaction, although these remain important, but significantly on the theoretical basis by which they may be explored. Influenced by emergent *post-colonial* discourse, the focus in recent years has been on the role of the individual and the material in the formation of Greek cultural identity.

Definition

Cross-cultural interaction defines the way in which people interact. It recognizes that no population group or their cultural traditions were *pure* or *original* nor that they were isolated from internal or external change. Rather, it extends beyond simplistic identifications of cultural provenance to focus on the social practice behind which dynamic and interrelated cultural identities are continually transformed by the experiences of those involved in culture contact. At a microlevel, the individual has agency in these interactions through their reactions, conscious or otherwise, to new influences, often visible overtly through resistance, coercion, or mutual accommodation. Equally, objects may play an active role in the creation and transformation of culture and cultural identity. At a broader scale, cross-cultural interaction may

have implications that extend far beyond the daily experiences of the individual to transcend social and cultural boundaries. Specifically, this relates to the presence of long-distance trade routes and migrant or colonial activity that enabled the transfer of ideas and technology.

Within the Greek world, cross-cultural interactions are evident in colonial contact with neighboring populations, particularly following the spread of diaspora and later interactions with the Persian Empire. While the lack of an integrated political or social *Greek* world is recognized by current scholarship, increasing appreciation of the multilayered nature of Greek culture has enabled the identification of cultural interaction at home and overseas within a broader framework of emergent *Hellenic* identity. Greek culture can thus be viewed as a permeable, complex system of interaction subject to constant renegotiation and redefinition and visible through similarity or difference between disparate cultural groups.

Historical Background

Studies of cross-cultural exchange developed contiguously with the emergence of classical archaeology as a discipline. This was rooted in the intellectual awakenings of eighteenth- and nineteenth-century Europe and against a backdrop of growing Western nationalism, nationhood, and imperialism that brought with it increasing perceptions of Western cultural superiority. Early studies viewed the Greek world as a unique, self-contained culture that became synonymous with cultural enlightenment and as progenitor of modern Europe (Trigger 2010: 61). The emphasis was on the recovery and identification of artistic, literary, and material remains associated with the Greek world and a preoccupation with their classificatory study. Evolutionary approaches stressed difference and inequality between divergent population groups and sought to demonstrate continual, linear progress in both biological and cultural terms. This was encapsulated in the search for the cultural origins of the classical world through the detailed analysis of material remains, their seriation, and interpretation as distinct stages of cultural development. The stimulus for cultural change was regarded as external and emphasized population movement and cultural diffusion from cores to their peripheries, as expounded by the likes of Oscar Montelius (1843–1921). By stressing a direct lineage to a perceived culturally superior classical world, the West was placed as preeminent and Western imperialism was thus legitimized (Hodos 2010: 5–6; Trigger 2010: 61–64, 215).

Growing emphasis on racial determinism and correlations between cultural and ethnic continuity led, by the end of the nineteenth century, to the emergence of a culture-historical archaeology encapsulated in the work of Gustaf Kossinna (1858–1931). This sought to identify discrete material assemblages that were perceived as ethnic markers for individual populations or *cultures*. Vast typological analyses, such as J. D. Beazley's studies of Greek vase painting, were integral, and, while focused on classification as an aim in its own right, they enabled comment on the development and distribution of artifact types in varied geographical and chronological contexts (Knapp and van Dommelen 2010: 4; Trigger 2010; Hodos 2010: 7). Yet, this approach also brought with it dangerous political or nationalist agendas that sought to create direct links to the classical past, most disastrously evident in World War II Germany.

Drawing on both evolutionist and culture-historical frameworks, the concept of *culture* was encapsulated by V. Gordon Childe (1892–1957) (Fig. 1) who first explicitly employed the term to define those shared attributes that formed the essence of a population group, its nature, and outward appearance. In Childe's model, each culture had specific traits that differentiated it from another and, by consequence, had a specific ethnic identity, resulting in a complex vision of European prehistory formed of myriad cultures. But this went beyond simple outward definition of culture. Change was stimulated by external factors such as migration and diffusion, while those local, *ethnic* traits defining each culture, such as burial practice, would remain less receptive to change (Trigger 2010: 246; Hodos 2010: 7–8).

Cross-Cultural Interaction Theories in Classical Archaeology, Fig. 1 V. Gordon Childe, 1892–1957. (Photograph: Swan Watson, Andrew. Portrait of V. Gordon Childe, c. 1930s. nla.pic-an23815428, National Library of Australia; Reproduced courtesy of the National Library of Australia and the Evatt Collection, Flinders University Library, Australia)

Childe's culture-historical approach remained influential until the latter half of the twentieth century. Classical archaeology in this period remained conservative and engaged in the study of the cultural remains to the detriment of understanding the cultural contexts that produced them (Trigger 2010: 498–502). Encapsulated in examinations of Greek colonial interaction by the likes of T. J. Dunbabin (1911–1955) and John Boardman (1927–), analysis of the Greek world for much of the twentieth century often assumed colonialist or philhellenic tones. Interaction with non-Greek populations focused on core-periphery models that stressed an exploitative, impermeable, and *civilizing* Greek core actively involved in the acculturation of a *barbarian* periphery and articulated by the term *Hellenization*. Typically this was explored at an elite social level that emphasized prestige or gift exchange and the correlation with historical events or figures. In Greek interaction with the East, this was inextricably bound with the notion of an *Orientalizing* phenomenon. This acknowledged the selective adoption of Eastern artistic and ideological elements by Greek populations during the formative periods of the Iron Age while stressing the active Greek role in this interaction.

While the emphasis on culture process and systems highlighted by *processualism* in European prehistory impacted little on classical archaeology, calls by the likes of Anthony Snodgrass (1934–) and Colin Renfrew (1937–) for greater theoretical focus did stimulate some development. Renfrew's theory of *peer-polity interaction* (1986) (Fig. 2) sought to remove the top-down diffusionist trends of core-periphery models (Fig. 3) by viewing interaction between communities within part of a broader network of exchange engendering competition and competitive emulation. An alternative approach employing similar ideas adapts Immanuel Wallerstein's *world-systems theory* to explore the ancient Mediterranean economy. Overseas contact and long-distance trade brought with it a range of interactions traditionally interpreted in terms of diffusionism from the East; the *Orientalizing* phenomenon. Contrastingly, the *world-systems* model posits a politically and economically dominant core with a periphery producing raw materials for the core. Within this, an interregional merchant class stimulates societal development and, by actively responding to economic stimuli, creates links between diverse populations while enabling the transmission of materials and ideas within the wider world system (Hodos 2006: 6; Trigger 2010: 438). Criticism of the model highlights its economic focus, which may not have been applicable to the ancient Greek world, as well as the difficulties in defining the *core* given the lack of a unified *Greece*. It has furthermore been suggested that *world-systems theory* overlooks the social context of interaction, potentially oversimplifying complex exchanges (Morris 1999: 68).

This change in focus by the 1980s coincided with increasing interest in Greek colonial

Cross-Cultural Interaction Theories in Classical Archaeology, Fig. 2 Peer-polity interaction: Exchange and competitive emulation between similar communities (*cores*) within a broader network of exchange and with little external stimulus

interaction and the *polis*. Closer examination of *polis* development, both at home and overseas, demonstrated the Greek world to be far from a monolithic, closed system but one that influenced and was influenced by those it came into contact with. No longer could Greek colonies be regarded solely as *homes away from home* (*apoikia*) or exploitative trading *emporia* nor could those traditionally perceived archetypical *Greek* cultural elements be seen solely as markers of ethnicity or population movement. Instead, scholarship focused on their formation and roles or functions in cultural interaction with, potentially hostile, non-Greek populations. While analysis of migration received limited attention (although see Knapp 2008: 47–53), the multicultural nature of the Greek world was explored through its interactions with Egypt and the Near East. Thus, Martin Bernal's *Black Athena* (1987) emphasized the cultural debt owed by Greece to Egypt but also maintained a rigid dichotomy that obscured the complexities of cultural interaction and arguably presented a reversal of *Hellenization*, the Greek world serving as cultural vacuum to be filled by Eastern culture (Dougherty and Kurke 2003: 2–4). It was only at the end of the twentieth century with the implementation of *post-processualist* frameworks that the theoretical debate fully engaged.

Cross-Cultural Interaction Theories in Classical Archaeology, Fig. 3 Core-periphery model demonstrating exploitative core with exploited periphery

Influenced by the likes of Ian Morris (1960–), the *post-processual* approach stressed the social meanings behind and interpretative potential of material sources as cultural representations (Hodos 2010: 9). An emphasis on agency, the individual and the social context of interactions often brought direct conflict with the broader generalizations of *processualism* but, at the same time, shifted the focus from traditional colonialist and diffusionist models. This is most clearly demonstrated in *postcolonial* critique emergent following the postwar dismantlement of Western

empire. Encapsulated in Edward Said's seminal text *Orientalism* (1978), *postcolonial* debate challenged traditional perceptions of Hellenic cultural dominance and stressed the complexities of cross-cultural exchanges (Knapp and van Dommelen 2010: 1). At a theoretical and interpretative level, this has generated a range of social and cultural frameworks aimed at understanding the structures, practices, and processes behind cultural change and the active role of the individual in defining changing identities. It is this approach that continues to inform academic debate.

Key Issues/Current Debates

Where analysis of cultural interaction had traditionally presented a static, monolithic depiction of something definably and intrinsically *Greek*, often in opposition to equally functionalist perceptions of static *others* (e.g., the Persian Empire), current scholarship takes a more nuanced approach to culture contact, exploring the social aspects and processes behind its formation. At the heart of the debate has been the deconstruction of traditional notions of *Greek culture* and the creation of an expansive theoretical discourse that explores the mechanisms of cross-cultural exchange and role (s) of the individual in their interplay. Much of the focus has been on the colonial Greek world through the implementation of *postcolonial* discourse.

Criticism of the *culture-historical* model emphasizes its search for simplistic and material representations of an *original* Greek culture (Dougherty and Kurke 2003: 1–2; Hales and Hodos 2010; Knapp and van Dommelen 2010). The approach taken by the likes of Bernal has met with similar disfavor due to what is seen as a lack of theorization and an essentializing nature (Dougherty and Kurke 2003: 2–3). Equally, the traditional focus of classical archaeology, emphasizing the *civilizing* nature of a dominant Greek culture over a passive *other*, has also met with disagreement (Hodos 2006: 10; Knapp 2008: 55–6). This is encapsulated in the abandonment of *Hellenization* as a concept, since it is argued that it lacks analytical power due to the assumption of Greek cultural dominance, unidirectional influence, and implied subjugation of the *other* (Dougherty and Kurke 2003: 3; Hodos 2006: 10, 15; Knapp 2008: 55–6). Instead, current scholarship expands beyond simple cultural identification to highlight the multifaceted, dynamic nature of interaction and the active role of both individual and material in defining it (Canepa 2010). However, it has been noted that this shift often maintains stereotypical, dualist perceptions of opposition (*us* vs. *them*), with the continued use of the term *colonization* rather than *colonialism* to define the Greek colonial encounter evidence of a reluctance to engage in cross-cultural analysis (Knapp and van Dommelen 2010: 3; although see Hodos 2006: 13–8).

It is argued that material culture is demonstrative of the social *practices* behind cross-cultural interaction, since it is through the process of interaction that objects can be modified or modify to suit the specific needs of all parties involved (Dougherty and Kurke 2003: 1; Langin-Hooper 2007). Material cultures may be interpreted as socially constructed representations of culture, each bringing with them distinct cultural, social, and even ethnic meaning or identity and dependent upon the context and time in which they form (Dougherty and Kurke 2003; Hodos 2010: 9). This need not necessarily be representative of cultural identity but rather demonstrates selective adoption and adaptation by the *recipient* population within a specific cultural context. Culture is thus seen as a permeable, complex system subject to constant renegotiation, collaboration, and conflict (Dougherty and Kurke 2003; Hodos 2006, 2010: 14–19). While material culture is regarded as a representative and constructive facet of conscious self-identification, a focus on ethnicity and ethnic identity within a multilayered *Hellenic* world has furthered debate.

By employing an *emic* approach (one produced from within, and meaningful to, the culture under study) that combines textual and archaeological data, this focus on ethnicity has been considered in the context of emergent *Hellenic* and *polis* identity and has removed essentializing approaches that assume unchanged ethnic identity based on racial and biological lines: the notion

that all Greeks are *Greek* (Hall 2002; Dougherty and Kurke 2003: 3–4; Antonaccio 2010). Instead, ethnicity is viewed as a fluid representation of society defined by its cultural, historical, and political experiences through which a sense of self-identity and perceived similarity or difference with others is formed (Hodos 2010: 11). Thus, the maintenance of Carian onomastics into the fourth century BCE or the perception by *both* Lydian and Greek populations throughout the Archaic period that Lydian culture was distinct from that of the Greek world demonstrates that despite Greek influence cultural interaction was more complex than simple domination by one monolithic entity over another (Hall 2002: 104–11). This approach furthermore recognizes individual settlement or *polis* identity within a broader *Hellenic* diaspora but with commonalities articulated in different ways (Hall 2002; Hodos 2010; Antonaccio 2010). Cultural interaction between subcultures was facilitated at key geographical locations, such as the panhellenic sanctuaries at Delphi and Olympia, which acted as *internal contact zones* for the cross-fertilization of ideas (Dougherty and Kurke 2003). This may have been reflexive and manifest materially at a range of social levels. Within this interpretation, population movement through trade and migrant activity has been regarded as indicative of a culture receptive to interaction. While this is often viewed in terms of an elite-level exchange, examination of broader social and cultural divisions, in conjunction with the removal of *Orientalizing* and *Hellenizing* concepts, indicates this may not have been representative of the Greek world (Hall 2002; Gosden 2004; Antonaccio 2010). Recontextualizing cultural elements in this *emic* approach has brought recognition of new identities resultant from cross-cultural interactions, as has been suggested in Sicily, for example, in the mixed cult practices at Sabucina or the divergent burial practices at sites like Syracuse and Gela (Hall 2002; although see Gosden 2004).

Emphasis on ethnicity has not been without its detractors or difficulties. It is argued that it is a modern fascination which is unhelpful in identifying cultural interaction and identities (Antonaccio 2010: 43). Equally, as a socially constructed facet of culture, it is not only difficult to define but, in reality, may have played little role in culture contact other than to simplify interaction (Dougherty and Kurke 2003: 6). But, it is also maintained that ethnicity is more than a static reflection of shared cultural similarity or difference and, while not equating to cultural identity per se, may be indicated materially (Hodos 2006: 17–8; Antonaccio 2010: 33–4).

A central theme in current discourse is the notion of identity, both outwardly created in antiquity or interpreted from the *etic* perspective of modern scholarship, that is, from the objective perspective of the observer external to the culture under analysis. Key to exploring this has been the notion of hybridity (Fig. 4) (Antonaccio 2003).

Cross-Cultural Interaction Theories in Classical Archaeology, Fig. 4 Possible evidence for hybridity in material culture: G2–3 ware kantharos (left) and grayware karchesion cup (right) from the island of Samothrace. The combination of Greek artistic with local cultural elements and their apparent function in specific cultural roles has been interpreted as evidence for the emergence of hybrid Greek/non-Greek identity on the island by the Archaic period (Ilieva 2010: Figs. 4–5. Reproduced courtesy of P. Ilieva)

This concept argues for the creation of new identities in reaction to the cross-cultural amalgamation of *new* and preexisting populations. Arguments against the usefulness of hybridity highlight that simple mixing of diverse aspects of material culture or ideologies does little to reveal the social or human aspects of interaction (Knapp 2008: 59). Equally, it presupposes the presence of identifiable and bounded cultural entities, which in the long term may be difficult to identify archaeologically as any *hybrid* identity gradually becomes what is perceived to be *local* (Gosden 2004; Antonaccio 2010: 48). However, proponents of the model argue that hybridity can be seen as the mixing of social, cultural, and material elements that stimulate the creation of entirely new identities (Knapp 2008: 53, 58–9). In colonial contexts, this often reflects the reinterpretation of meanings attached to individual objects or ideas, demonstrable materially through the appearance of new assemblages that combine differing cultural elements with social meaning specific to their context, for example, through the adoption and adaptation of ceramic form or decoration to reflect local social practice or meaning, rather than simply in imitation of new cultural traditions.

In defining where hybridity operates, *post-colonial* discourse has adopted the notion of the *Middle Ground* as an alternative to other core-periphery frameworks (Antonaccio 2010: 44–5) (Fig. 5). The *Middle Ground* is regarded as both an intellectual and physical space, with such physical contexts arguably identified in North Syria, Sicily, and North Africa. It serves as a neutral ground where all participants have agency but, through mutual accommodation, redefine meaning and value, often creating new hybrid identities. In this respect, the *Middle Ground* serves as both core *and* periphery within which divergent material culture, ideas, and ideologies engage (Hodos 2006: 7).

An important conceptual tool has been the role of *agency*. This draws on Pierre Bourdieu's (1930–2002) notion of *habitus*, which refers to the learned and experiential practices perpetuated through everyday life that inform the conscious or subconscious reactions by an individual, an *agent*,

Cross-Cultural Interaction Theories in Classical Archaeology, Fig. 5 The Middle Ground: A physical and ideological melting pot where ideas and material may combine to produce distinct new *hybrid* identities

to any given situation. *Agency* is seen as a means of identifying the individual and their capacity for choice in cross-cultural exchanges, although there has been little consensus with regard to how it might be recognized or indeed its implications (e.g., Dobres and Robb 2000). In colonial settings, the importance of the concept lies in the ability to identify the spread and reinterpretation of imported items in tandem with the cultural codes of local or hybrid populations (Douglas and Isherwood 1996; Hodos 2006: 8–9). Thus, it is argued that the choice to adopt a particular form of imported material culture and reinterpret it so that it has both social and cultural meaning also ascribed to it a certain value, whether intrinsic or societal (Appadurai 2008). This may result in it becoming integral to that social or societal context. For example, while the presence of hoplite armor in Sicily might initially suggest *Hellenization* of the region, it is only through an understanding of its context that it is realized that it performed a differing, elite function specific to its colonial context as armor for mounted warriors (Hall 2002: 109).

Related to agency and hybridity has been the introduction of *performativity* as a means of defining the way in which identity is produced. In this framework, material culture is seen as constructing and constructed by cultural interaction through the meanings and ideas that embody

it. An intentional, *performative*, act by an individual might reinforce or alter cultural identity through the selective consumption of specific items that have distinct cultural codes (Douglas and Isherwood 1996; Hodos 2010: 18–9). While objects can transcend cultural boundaries, the transmission of culture itself is dependent on recognition by those involved of the ideologies or meanings behind such objects. However, it is also stressed that recognition of *performativity* is dependent on sociohistorical understanding of their context and that changes may occur between each *performance* or be read at multiple social or cultural levels (Hodos 2010: 18).

The need for an approach that explores the impact and involvement of localized interactions within broader cultural systems has also been recognized by recent scholarship (Knapp and van Dommelen 2010: 3). The *diffusionist* model has met with criticism, but the reconciliation of the local and global into a more encompassing narrative has produced something of a dichotomy. Critics of the *post-processual* approach highlight that the social focus has been both too narrow and geographically localized. Indeed, supporters of *world-systems theory* argue that it is only through broader, global perspectives that the context of localized exchange can be understood (Morris 1999: 68). In contrast, detractors to the *world-systems* approach point to the generalizations and oversimplifications of core-periphery models, with the *Middle Ground* highlighted as a potential alternative. However, it is the notion of *connectivity* that has generated renewed discourse. This stresses the interaction and interconnectedness of divergent Mediterranean micro-regions facilitated by diverse microecologies that interact through a sea conducive to communication (Horden and Purcell 2000). Thus, production, risk, and redistribution stimulate mobility of objects and people, forging coherence and *connectivity* between micro-regions. An emphasis on wider Mediterranean interactions is apparent, but the model also highlights the dynamic role of local interaction internal to each micro-region and, at the same time, shifts the focus away from that of core-periphery approaches to view urban centers as larger units within a more complex, interrelated system (Horden and Purcell 2000: 123). Within this framework, consumer demand can also drive production and is reflected in the attachment of both intrinsic and social value or meaning to specific objects through the mechanisms of the *habitus* (Hodos 2006: 8–9; Hodos 2010: 20). In this regard, cross-cultural interaction may initially occur at an elite or prestige level until the cultural codes of the objects themselves are more widely understood and lose their exclusivity, with *agency* enabling the transmission of technology and ideas (Douglas and Isherwood 1996; Hodos 2006: 8–9). In colonial interactions, this may reveal the reasons behind the adoption of specific objects and further draws on the notion of *materiality*, whereby the cultural identities of those involved in interaction shape and are shaped by the material world around them (Knapp and van Dommelen 2010: 2–8).

Developing from notions of *connectivity*, there has been increasing emphasis on *Mediterraneanization* and *globalization* within the Greek world. The *globalization* model posits the presence of an overriding *global* culture that transgresses localized cultural identity, within which intensified interaction reinforces local diversity (Hodos 2010: 23–24). This stresses the particularities within the broader cultural framework, often leading to overt assertions of self-identity in opposition to others (e.g., Ilieva 2010). *Mediterraneanization* draws on both *globalization* and *connectivity* to suggest a broader network of interaction that emphasizes the active process of connectedness within the Mediterranean region (Hodos 2006: 9). While both approaches offer broader perspectives with respect to cross-cultural interactions, the danger of replacing simple ethnic markers with regional labels, and thereby conflating ethnic and cultural distinctiveness, has also been highlighted (Isayev 2010: 224).

International Perspectives

The current focus of British academia is twofold. At a social level, *postcolonial* studies have had a significant and lasting impact on scholarship, with emphasis on the nuances of interaction and the removal of traditional colonialist approaches. The individual and the role of agency continue to inform debate, and recent studies have

focused specifically on the mechanics behind the creation and redefinitions of identity both within the Greek world and in their interactions overseas (e.g., Hales and Hodos 2010; Knapp and van Dommelen 2010). These studies view Greek culture as changing and dynamic, exploring the many sociocultural facets subject to potential change.

The connectivity of the Mediterranean region has become an increasing area of discourse (e.g., Horden and Purcell 2000), and this relates in part to the second focus of research into the wider systems within which the individual, *local* exchanges took place. Notions of *Hellenization* have largely been dropped from academic debate, while attention has returned to the question of how ideas, technologies, and *culture* were transmitted within and around the Greek world. Critique of traditional *diffusionist* models is apparent, and, with the implementation of frameworks such as *globalization* or *Mediterraneanization*, the beginnings of a more holistic approach incorporating elements of wider world systems with the minutiae of localized culture contact are emerging.

Future Directions

While current discourse has produced an active and scholarly debate, particularly surrounding notions of identity and materiality, aspects of the discussion provide scope for future research. There remains a problem of theorization within classical archaeology, which has been slow to adopt new direction and frameworks of analysis. Furthermore, there is a maintained tendency of *hyper-specialization* and localized or regional research that lacks an interregional scope (Knapp and van Dommelen 2010: 3; Mattingly 2010: 284). A sociohistorical approach that draws together material, social, and textual data may well provide the basis for a framework that incorporates local and global interactions while avoiding generalizations (e.g., Knapp and van Dommelen 2010; Mattingly 2010: 287). This may be facilitated by renewed focus on migratory processes and the role of material culture in cross-cultural interactions.

While scholarship has begun to shift from traditional paradigms, the incorporation of new theoretical directions has in some areas met with reluctance and reticence. To fully understand the nature of cross-cultural exchanges at local, regional, or global levels requires that the archaeological and textual remains produced through academic research are engaged in theoretical frameworks that allow for their full potential to be understood.

Crossland, Leonard Brighton

Benjamin Kofi Nutor
Department of Anthropology, University of Texas at Austin, Austin, TX, USA

Basic Biographical Information

Mr. Leonard Brighton Crossland (Fig. 1) is a Ghanaian archaeologist born on November 10, 1941 in Accra, Ghana. He attended the Wesley Grammar

Crossland, Leonard Brighton, Fig. 1 Leonard B Crossland assisting graduate students with European ceramic analysis

School, Accra (1958–1962), and the Ghana National School, Cape Coast (1962–1964) before proceeding to the University of Ghana (1969–1971) for his Bachelor of Arts (B.A) degree in Archaeology and Ancient History. He obtained his Master of Arts (M.A) in African Archaeology from the University of Ghana in 1971 and was a Junior Fulbright-Hays Fellow at the Arizona State University, Tempe, USA from 1977 to 1978.

Mr. Crossland began his archaeology career as a teaching assistant at the Department of Archaeology, University of Ghana, Legon (1971–1972), then as assistant lecturer (1973–1975), and lecturer (1975–1991) at the same department. He was promoted to the position of senior lecturer in 1991 and served in that capacity until his exit from active teaching service from the University of Ghana in 2010. This long service to the University of Ghana includes 9 years of post-retirement contract (2002–2010). His areas of specialization include museums conservation, archaeological field and laboratory methods, technological traditions of Ghana, and analysis of seventeenth- to nineteenth-centuries European imports (particularly ceramics and glassware) in West Africa.

At the University of Ghana, Mr. Crossland held several positions including Head, Department of Archaeology (1993–2001), and Acting Director of the West African Trade Project (1974–1975). He served on several Boards of the University of Ghana such as Board of Faculty of Social Studies (1997–2001), Board of Faculty of Arts (1992–1996), Board of Graduate Studies (1993–2006), Academic Board (1990–2001) Admissions Board (1990–2001), and Examiners Board (1993–2001). Mr. Crossland is a member of various national and international associations. These include the Old Accra Conservation and Development Association, Ghana Bead Society, World Archaeological Congress, and the West African Museums Programme (WAMP).

Major Accomplishments

Mr. Crossland had taught and mentored several students of the Department of Archaeology, University of Ghana, including majority of current faculty members of the department. Following the exit in the early 1980s of most of the expatriates who helped to establish the Department of Archaeology, University of Ghana, and the exodus of the few Ghanaian archaeologists to Nigeria and elsewhere, Mr. Crossland was one of the key Ghanaian archaeologists among a skeletal teaching staff (comprised of John Sutton, Joan Dombrowski, and James Anquandah) that worked assiduously to ensure that the department survived. He had to abandon his doctoral program at the Arizona State University, Tempe, USA, and rush home to strengthen the teaching faculty of the department.

His involvement in the West African Trade Project directed by Merrick Posnansky led to the publication of one of the key reference books for the analysis of local ceramics in particular and on the ancient trade and urban site of Begho, Ghana, in general (Crossland 1975, 1976, 1989a, b; Crossland and Bredwa-Mensah 1997; Crossland and Posnansky 1978). His broad research interests also include the history and archaeology of communities in the Accra plains (Crossland 1989b, Crossland and Bredwa-Mensah 1997). Mr. Crossland has in-depth knowledge of European trade materials in West Africa and provides expert analysis of these materials to students and faculty of the Department of Archaeology (Fig. 1). His exhibition of these materials at the Department of Archaeology Museum, University of Ghana, from 2008 to date as part of the department's exhibition on the general theme "Researching Ghana's Heritage" is most illuminating. He was a member of the Board of Examiners for University of London Diploma in Conservation and Management of Museums in sub-Saharan Africa from 1995 to 1996.

Mr. Crossland was an advisor to the committee that put together a highly successful exhibition on textiles to commemorate the 50th independence anniversary of Ghana in 2007. The exhibition dubbed "Fabric of a Nation: textiles and identity in modern Ghana" was mounted concurrently at the Department of Archaeology Museum, University of Ghana, and the British Museum in London, UK. He was also a subcommittee member that successfully upgraded the permanent museum at the Kwame Nkrumah Memorial Park, Accra, also in connection with Ghana's 50th anniversary celebrations. He was a member of Ghana's National Committee for the Return and Restitution of Cultural Property from April to June 1985.

Mr. Crossland successfully mounted a bead exhibition at the VIP Lounge of the Kwame Nkrumah Mausoleum, Accra, in 2008. This was part of a collaborative research between the Italian Embassy, Accra, and the Centre for African Studies, University of Milan, Italy, dubbed "A Study of Trade Beads from Venice to the Gold Coast." His immense knowledge of beads also led to the publication of a useful chapter (Crossland 2003), based on his bead exhibition at the Department of Archaeology Museum, University of Ghana.

Away from the academia, Mr. Crossland has chalked enormous success in the world of private business.

Crumlin-Pedersen, Ole

Joe Flatman
English Heritage, London, UK

Basic Biographical Information

Born in 1935 and dying in 2011, Ole Crumlin-Pedersen was constantly active in the field of maritime archaeology from 1957 onward, when he first worked at the Skuldelev site that he is most famously connected to. For the majority of his career, he was effectively in charge of Denmark's maritime heritage, serving as Curator of Maritime Archaeology at the National Museum of Denmark between 1962 and 2003. Between 1998 and 2003, he also served as Visiting Professor at the Institute of Medieval Archaeology, Aarhus University. Following his retirement, from 2003 onward, he continued to work as a researcher at the Viking Ship Museum in Roskilde that he helped found. Crumlin-Pedersen had initially studied naval architecture at the Technical University of Denmark (1957–60), before serving in the Royal Danish Navy (1960–62), returning to Skuldelev for its final excavation in 1962. He was at the forefront of maritime archaeology and ethnology from 1962 onward, focusing on Denmark but with an international research profile. He was central to the development of maritime archaeology as a formal academic discipline, including the public understanding of this specialism.

Major Accomplishments

Crumlin-Pedersen came to prominence through his involvement in the survey, excavation, and recovery of what eventually turned out to be five Viking Age ships deliberately sunk as part of a barrage at Skuldelev, in Roskilde Fjord some 20 km north of the medieval town of Roskilde somewhere between c. 1070 and 1090 CE. This work led to the first of numerous publications on the vessels recovered, commencing in 1958 (see Crumlin-Pedersen and Olsen 1958). The full publication of this site continues, following most recently from the first of a series of final publications (Crumlin-Pedersen and Olsen 2002). The remainder of Crumlin-Pedersen's career after 1962 was spent in the study of these vessels and their related materials, but this process of discovery led to a diverse career examining many aspects of maritime archaeology in northwest Europe from prehistory to the Middle Ages, including a significant leadership and educational role, both within the museum sector and also in the then-burgeoning academic specialism of maritime archaeology. Not for nothing is his British contemporary Seán McGrail said to have responded "to become the British Crumlin-Pedersen" when asked at an interview for the new position of maritime archaeologist at the National Maritime Museum in Greenwich what his intentions were.

Crumlin-Pedersen's long career and research interests are neatly summed up in two books, one by him and one by his friends. In 1995, in celebration of his 60th birthday, his friends and colleagues published a book of essays in his honor entitled "Shipshape" (see Olsen et al. 1995). In 2010, Crumlin-Pedersen himself then published his "Rhind" lectures of 2008, a book that explains both his activities and his philosophy over his career (see Crumlin-Pedersen 2010). In particular, Crumlin-Pedersen was instrumental in the development of three interrelated fields of study in maritime archaeology: firstly, the study of medieval (especially Viking Age) ship technology and shipbuilding traditions (see in particular Crumlin-Pedersen 1991); secondly, the study of related prehistoric and medieval maritime cultures, especially the symbolism of these communities (see in particular Crumlin-Pedersen and Munch Thye 1995); and thirdly, the use of experimental archaeology in maritime archaeology, especially the construction and sailing of full-scale reconstructions of Viking age ships (see in particular Crumlin-Pedersen and Vinner 1986). It is the

latter in particular, which resulted in the series of dramatic replicas of the Skuldelev ships sailed around the waters of Europe and in some cases even further afield that brought Crumlin-Pedersen to widespread public attention. The largest of these reconstructions, of the Skuldelev 2 "long-ship," was built in the experimental shipyard at the Viking Ship Museum in Roskilde between 2000 and 2004, and famously made a return journey to Dublin and back in the summer of 2007, the likely construction location of the original ship in c. 1042 CE (see Viking Ship Museum 2007). It is this long-term leadership role in museum development and public education that as much as anything marks out the significance of Crumlin-Pedersen's career in archaeology. The fame of and respect for the Viking Ship Museum that he was so instrumental in creating and promoted helped advance the cause of maritime archaeology around the world from the 1960s onward.

Cuba: Archaeological Heritage Rescue and Management

Lourdes S. Dominguez[1] and
Gabino La Rosa Corzo[2]
[1]La Havana City's Historian Office, Cuban Academy of History, La Havana, Cuba
[2]Cuban Academy of History, La Havana, Cuba

Introduction

Rescue, conservation, and management of the archaeological heritage of the island of Cuba are closely linked to the development of archaeology in the country. Since 1847, when Spanish Miguel Rodríguez Ferrer performed the first explorations and collections of archaeological evidence in the island, discussions began about how to conserve and use the archaeological wealth that collecting of those times exposed (Rodriguez Ferrer 1876).

This would be a constant discussion within the scientific and intellectual circles of the country related to inquiries about archaeology. Reflecting this debate and concerns of scholars and others interested in these issues, the formula of encouraging private collections was shaped by the same scholars. Private collecting was a response of the archaeologists of these times to cope with the deficiency of state structures that paid little attention to these issues. Within these private collections, Eduardo García from Holguín, R. L. O'Fallon and Bacardi from Santiago de Cuba, and Pedro García Valdés from Pinar del Rio stand out.

These collections as well as some others of less territorial representativeness were always available to scholars and people interested in archaeological studies. Scholars included Mark

R. Harrington from the Museum of the American Indian, who worked in Cuba between 1915 and 1921; European Sven Loven who worked in 1930; and Irving Rouse from Yale University in 1941. These collections presented a significant amount of information about indigenous cultures that inhabited the territory and were available to scientists from other countries over the years; many of these collections became part of important museums and are treasured heritage of our country.

Key Issues/Current Debates/Future Directions/Examples

During those years, and as a result of the interest promoted by archaeological research, collecting, and naturalistic studies, some museums were promoted and over the years they became paradigms of conservation of the archaeological heritage of the country, such as the case of the Anthropological Museum Montane in La Habana, Bacardi Museum in Santiago de Cuba, Natural Sciences Museum in Pinar del Río, and Oscar María de Rojas Museum in Cárdenas.

At the same time, during the 1920s, 1930s, and 1940s, there was some progress in recognizing heritage values of colonial buildings, and this was reflected in Republican legislation aimed at protecting and safeguarding colonial sites or sites linked to important events of colonial history. The 24 July 1928 Law authorized the President to perform such functions.

Advances in legal aspects to safeguard locations and buildings considered as National Heritage helped to create a favorable environment to historical and archaeological studies related to major events of national history. The declaration of national monuments applied to the Cathedral of Havana and town of Mantua in Pinar del Rio (3 September 1935), the City of Bayamo (30 December 1935), Santa Ifigenia Cemetery in Santiago de Cuba (7 September 1937), Paula Church in Havana (5 August 1944), José Martí's birthplace (5 February 1949), and Aldama Palace (22 April 1949), and the National Commission for Archaeology was created in August 1937. All this impacted positively on the development of a new archaeological discipline in the country: historical archaeology (La Rosa 2000).

It was with the birth of the Academy of Sciences of Cuba under the protection of the 1011 Act 20 February 1962 and the creation of an Institute of Anthropology that archaeological studies in Cuba reached certain levels of significance and along with it the existence of a coherent and systemic state policy aimed at the rescue, preservation, and management of the archaeological wealth of the country.

From that moment, and for the first time, a group of professional archaeologists would enjoy legal, institutional, and economic support to transform archaeology into their main activity. This enabled work in a national scope to be organized and systematized so that the task of rescuing and studying history's most remote past on superior bases related to technical resources and theoretical approaches could be connected with universities and related institutions. Substantial support to archaeological research with heritage purposes was given by historians and architects who had been working in the field of colonial buildings (Prat Puig 1996; Weiss 2002; Soraluce and Machado 2005).

Historical archaeology, as the latest of the disciplines of the field, emerged in those years in the country and continued opening up its way and gaining a space. Thus, F. Boytel Jambu conducted archaeological research and restoration of a plantation of French settlers in the Sierra Maestra in eastern Cuba and published the results in a title that would serve as a guideline in this field (Boytel 1962). It is not the mere study of a building, but one of the first examples in the specialized historiography of archaeological research directly concerned with the rescue and restoration of an architectural and spatial complex and its touristic exploitation. In short, Boytel Jambú's work demonstrated, in the context of the period in which archaeology of Cuba acquired institutional character, the great potential of the so-called historical archaeology, not only at the level of rescue by colonial history and heritage values but also at the economic benefits of such work, as it was implemented at the service of tourism.

The procedures used for field work and restoration of archaeological evidence and its social

Cuba: Archaeological Heritage Rescue and Management, Fig. 1 La Habana in 1851. (Engraving published in 1851 in London by Smith Brothers)

and economic implications turned this work into a new starting point for rescue and restoration tasks that have later developed in the country. In that work, the genesis of the current rescue and coffee heritage management of the eastern region of the island is found, with the location and safeguarding of 171 ruins of such plantations in the eastern mountains. These have been declared as World Heritage by UNESCO.

The institutional system that supports this rescue and management policy has been perfected over the years, in the same way as the laws that protect such policy. In August 1977, Law number 1 on the Natural and Cultural Heritage Protection was passed. Law number 2 also defined and upheld the declaration of local and national monuments, under whose protection Material and Immaterial Cultural heritage is defined, and the National Monument Commission was created as the highest Institution responsible for its fulfillment, ascribed to the National Council of Cultural Heritage of the Republic of Cuba.

The main objectives of the National Council of Cultural Heritage are protection, rescue, conservation, restoration, exhibition, research and dissemination of cultural and natural heritage, and the training of professionals in the field. It performs its tasks at a national level, through the Provincial Cultural Heritage Centers ascribed to museums, Monument Technical Teams and Provincial Cultural Property Records.

This policy has been particularly concerned with the necessary measures to ensure the enjoyment of heritage goods by the general population and tourism and protection.

The national network of Municipal Museums of Culture, Provincial Museums, and Museums offering a particular thematic line based on historical events of cultural significance in the territories are linked to general education programs and cultural and commemorative activities.

Work has been done in the rescue of important archaeological and cultural sites, involving archaeologists, architects, and historians. This work has resulted in solid archival and field research and has led to the restoration and enjoyment of the people visiting the major historic centers of the first villages founded during the conquest and colonization (Figs. 1–4) (Domínguez 1984, 2005; Gómez and Gomora 1986; La Rosa 2003; Leal 2003; Garcia 2004, 2008; Office of the Curator 2005).

The largest of the Antilles has a National Registry of Cultural Property that is constantly updated with the declaration and management of sites declared National Monuments and numerous

- Historic City of Cienfuegos, 2005. Cultural Asset
- Historic Centre of Camaguey City, 2008. Cultural Asset
- The Tumba Francesa, 2008. Masterpiece of Oral and Immaterial Heritage

At a national level, there are a number of teams of archaeologists, architects, engineers, builders, and historians who are engaged in the rescue and preservation of archaeological heritage of the island. In recent years, the work that Dr. J. M. Guarch began in the 1980s, in a large aboriginal cemetery on the site Chorro de Maita, Banes, Holguin Province, has come to life again. There is an open museum that reproduces a village where aboriginal potters and farmers worked and lived in the mid-sixteenth century. Replicas of 108 exhumed burial sites and the accompanying grave goods are shown there (Fig. 5).

Similarly, we indicate the Buchilones site, located in the wetlands of the northern province of Ciego de Avila, from which hundreds of archaeological wood pieces have been exhumed, including canoes, idols, and remains of houses, with a chronological range between CE 1220 and 1640. The work carried out with the cooperation of specialists from the University of London permitted that the most valuable pieces could be treated. In that place a Museum to display and preserve this valuable Aboriginal heritage is being finished (Fig. 6).

Cuba: Archaeological Heritage Rescue and Management, Fig. 5 Wooden anthropomorphic idol from Buchillones, Ciego de Ávila. (Photo courtesy of J. Calvera)

The authors of this work also advise on the rescue of the French coffee plantation ruins in Sierra del Rosario, west of Havana, where almost one hundred of these important coffee plantation remains are found. They are examples of the architecture of French influence in Cuba and technological development of the mid-nineteenth century (Figs. 7, 8). This task is part of the work of Las Terrazas Resort and its sustainable development project through the ecological use of heritage and trail tourism.

Virtual reconstruction of San Pedro coffee plantation, carried out as part of the study, salvage and information dissemination about these archaeological sites. To the *right*, is the domestic area; in the *middle* and to the *left*, is the

remains underground and also on the surface, under the direction of the Archaeology Cabinet of the Havana City Historian Office and its Master Plan.

The treatment given to the first Havana City is a real testimony to the efforts of generations that have offered their expertise to this endeavor from the systematic policy of heritage work that has been carried out there.

Cueva de las Manos, Río Pinturas Cave Art

Maria Onetto
CONICET/INAPL, National Institute of Anthropology and Latin American Thought, Ministry of Culture of the Nation, Buenos Aires, Argentina

Introduction

Cueva de las Manos is an archaeological site with rock art located on the rocky walls of the extraordinary Río Pinturas canyon, northwest of the province of Santa Cruz, Argentina. The site includes a cave and several surfaces of open air cliffs decorated with magnificent pictographs and is surrounded by a unique natural habitat. Cueva de las Manos undoubtedly possesses outstanding universal value which justifies its inclusion on the UNESCO World Heritage List in 1999 (Fig. 1).

Definition

Rock art, as one component of the archaeological record, gives us important information about the material and spiritual past of humans. This type of site is subject to constant natural and cultural deterioration. For this reason, the scientific community has become aware of the importance of its preservation.

Since 1995 the National Institute of Anthropology and Latin American Thought (INAPL) has initiated a program to prevent the destruction of rock art sites and to encourage their preservation. Conservation priority has been given to Cueva de las Manos, with concrete conservation actions that are still implemented today.

Key Issues

The paintings in the cave, overhangs, and cliffs of the Alto Río Pinturas are impressive because of their location on the deep ravine wall surrounded by a lovely setting and because of its artistic composition, the polychrome design, and beauty. Cueva de las Manos stands out not only for the beautiful natural environment but also for the countless cave paintings and art forms represented along the cliffs and rocky overhangs that line the river. There is a profusion of pictorial motifs made in different shades and countless superimpositions that have occurred throughout eight millennia of art production. The combination of these factors provides a unique aesthetic experience for the visitor (Figs. 2 and 3).

Outstanding universal values of the site are fully contained both in the core and in the buffer zone. The habitat surrounding the archaeological site remains intact and contains the same zoological species represented from 10,000 years ago in the rock art (Fig. 4).

This is a particular environment, unique and atypical, both at the provincial and regional levels, with great value for the conservation of natural systems in Argentina. The same can be said about the rock art, which despite the inevitable but very slow natural decay suffered for ten millennia and the damage caused by human action, it is in outstandingly good condition.

Moreover, research broadly corroborates the authenticity of Cueva de las Manos as a unique evidence of one of the first groups of hunter-gatherers that inhabited the South American region in the early Holocene.

Scientific excavations coordinated by C. J. Gradin together with C. A. Aschero and A. M. Aguerre demonstrated the link between the rock art with groups that inhabited the region ten millennia ago. Evidence from excavations in the cave area allowed for contextual associations between cultural levels and paintings, based on a detailed study of the overlays, the differential use of tones, the different degree of conservation, and the location of representations in different sectors. This relationship between the different cultural levels of the site is based on evidence showing a direct association between mineral pigments or painted-fragment remains detached from the wall, found during excavations, and the radiocarbon dates (Gradin et al. 1976, 1979; Gradin and Aguerre 1994) (Fig. 5).

Cueva de las Manos, Río Pinturas Cave Art, Fig. 1 Site location

Cueva de las Manos, Río Pinturas Cave Art, Fig. 2 Río Pinturas canyon

The main product of the hunt was the guanaco (camelid), which was the main food support of these groups, providing meat, skin, fat, bones, and tendons. Naturalistic representations of this animal in a variety of attitudes were painted on the rocks.

The most outstanding scenes are those with high anecdotal value in which the animals are chased and surrounded by hunters, trapped, and killed using their throwing weapons or spears and stone balls. There are hunting scenes showing several hunters with lances attacking a herd of 20 guanacos.

Hand stencils (negative handprints) are a constant artistic expression at the site from its earliest days. There are concentrations of various sizes and colors, including red, purple, white, black, yellow, orange, ochre, and a few green. Studies revealed interesting findings about this tradition that has lasted for nine millennia.

Then guanacos appear in isolated sets of static attitude and bulging belly, with no connection between man and the prey.

The next phase is characterized by increasingly schematic art including drawings of lizards (or matuastos), negative hands, stylized human figures, and guanacos crudely executed, besides "rosettes" or circles surrounded by dots, a three-toed bird print similar to choique (a rhea, a large flightless bird).

Cueva de las Manos, Río Pinturas Cave Art, Fig. 3 Rock art details

The final phase in the artistic sequence is characterized by outlining and the use of an intense red color for predominantly geometric figures such as zigzags, straight lines and angles, pinpoint, and circles. The human figure is produced with linear strokes. It also includes schematic representations of hands and negative hands, some executed on a prepared base in another color.

Protection and Management

INAPL undertake rock art documentation and study the natural and cultural damage to the site, as well as providing for the transfer of knowledge and community empowerment. It has also

Cueva de las Manos, Río Pinturas Cave Art, Fig. 4 Scenes panel

Cueva de las Manos, Río Pinturas Cave Art, Fig. 5 Painted hand superimposed to painted guanaco

developed a management plan for the overall management of the site and work on the dossier for entry onto the UNESCO World Heritage List (Onetto 1998). Since 1997 the National Architecture Office carried out infrastructure works proposed in the plan. It also conducted an analysis of the stability of the slope, which included the study of mobility in soils and potential risks by a geologist (Zárate 2005).

The management plan for the site has been praised because it meets the conservation requirements of World Heritage properties (UNESCO 1999). This plan proposed several concrete actions, which have been fulfilled over 10 years of management: permanent custody of the place; strict control of entry of visitors, tour guides trained for that purpose, set schedules for visits, and times for guided tours; bounded groups of 15 people; and prohibition to enter without a guide, facilities for guide accommodation, interpretative posters, and high-resistance wooden walkways in the circuit of the paintings (Onetto et al. 2010).

In 2008, the Agencia Espaþola de Cooperación Internacional para el Desarrollo (AECID) provided a project grant for "Conservation and Sustainable Management of Cultural Heritage. Hands Cave: 10,000 Years of History in Patagonia," based on the INAPL and coordinated by Maria Onetto. This has allowed a new phase of research and public use of the site, adding María Luz Funes and Andrea Murgo to the team, with a proposal that directly involves the community. The overall objective of the project is education and raising community awareness for the safeguarding of traditional knowledge (Podestá and Onetto 2004).

An interpretation center was opened in the reception room on the site, we worked on the edition of a handbook for schools of the province of Santa Cruz and the project of the Museum Carlos Gradin in the town of Perito Moreno was implemented, for the exhibition of archaeological material and laboratory researchers (Onetto et al. 2010).

Fieldwork was completed, monitoring of the condition of the art. A photographic survey to

make a digital archive that will provide a complete record of art was also made.

The tasks of management, monitoring, and research on the site by the National Institute of Anthropology and Latin American Thought continue ensuring ongoing maintenance of the integrity of its outstanding universal values.

Cult Stones of the Ancient Eastern Mediterranean

Sam Crooks
School of Historical and Philosophical Studies, University of Melbourne, Parkville, VIC, Australia

Introduction

Aniconic stones feature in the cultic traditions of several cultures of the ancient eastern Mediterranean. In the Bronze Age Aegean they are called baetyls and, based on their representation in Minoan glyptic iconography, are associated with ecstatic ritual evoking divine epiphany (Evans 1901; Warren 1990; Crooks in press). Early religio-historical sources support the ascription of cultic significance to standing stones in the Levant, where they are called *masseboth* (singular: *massebah*), known primarily from Bronze and Iron Age sites (Moore 1903; Graesser 1972; Mettinger 1995; Avner 2001; Zevit 2001). Phoenician expansion across the Mediterranean during the Iron Age sees the increased incidence of stone cult in the region (Mettinger 1995), including in Cyprus where cult stones are known from the late Neolithic (Crooks 2012).

Definition

Cult stones in the ancient eastern Mediterranean are naturally formed or modified stones of varying appearance and use. They are associated with cult, particularly in the Levant, Cyprus, and Crete during the Bronze and Iron Ages. Ranging in shape and size from small water-worn ovoid stones as little as 20 cm in diameter in Cyprus to large roughly hewn standing stones up to 2 m in height in the Levant, they are typically of igneous rock or limestone and may be arranged singly or in groups. While the appearance and function of cult stones varies regionally, the unifying quality of such stones is their cultic significance, discernible through context.

Key Issues/Current Debates/Future Directions/Examples

In the ancient Near East, the veneration of stones is particularly well attested in the Levant (Moore 1903; Graesser 1972; Mettinger 1995; Avner 2001; Zevit 2001). The book of *Genesis* describes the story of *Jacob's Dream at Bethel* where Jacob "took the stone that he had put under his head and set it up for a pillar and poured oil on the top of it. He called that place Bethel.... Then Jacob made a vow, saying, 'If God will be with me... this stone, which I have set up for a pillar, shall be God's house...'" (Genesis 28: 18–22). Jacob's *massebah* is characteristically *set up*, acting as a mnemonic marker commemorating a covenant. The sacred stone is also the house of god, "Bethel" – the dwelling place of the supernatural spirit or power. Levantine masseboth may serve as cult idols located within a holy-of-holy, as boundary markers or mnemonic devices memorializing territorial control, or as liminal markers situated in proximity to city entryways.

In the Aegean, aniconic stones feature in the cultic tradition of the Minoan Bronze Age, where they are called baetyls, a term suggestive of an etymological link with the Hebrew "beth-el" (Evans 1901: 132–3, Moore 1903; Rutkowski 1986; Marinatos 2009). Best known from their depiction in Neopalatial glyptic iconography, baetyls commonly appear as waist-high ovoid stones which are hugged or leant upon by an anthropomorphic figure, sometimes in association with the shaking of a sacred tree. Such scenes are thought to represent ecstatic ritual evoking enacted or embodied epiphany, the immanence of the divinity or spirit resident within the stone thought to be represented by flying creatures, such as insects or birds, or by floating anthropomorphic figures. Minoan baetyls may have served as aniconic cult objects or as the animistic dwelling places of divinities or spirits (Warren 1990; Crooks in press).

Phallic cult stones are known from as early as the Ceramic Neolithic in Cyprus (Crooks 2012), however, the use of stones in Cypriot cult is most commonly attested from the Iron Age, following increased exposure to Phoenician and Aegean cultural influence. While not typically phallic in appearance, Cypriot cult stones are nonetheless most frequently associated with fertility cults (Karageorghis 1992: 212), reflecting the influence of Frazerian seasonal-allegory theory which posits a preoccupation with fertility as a feature common to all early agricultural societies (Frazer 1890: IV).

Cultural evolutionism has often informed the interpretation of ancient cult stones, so-called "primitive" cultures thought to employ aniconic cult images as precursors to the more sophisticated anthropomorphic images utilized by more highly evolved groups. This is demonstrably inaccurate, aniconic cult stones commonly occurring alongside anthropomorphic cult images. Similarly, it is often held that theistic religions evolve out of ancestor cult, manifest in the idea that grave stones, a common point of focus in rituals commemorating the dead, may over time come to be perceived as the physical abodes of the spirit of the deceased. Finally, the concept of animism expounded by the Victorian comparative ethnologists (Tylor 1871; Smith 1889; Frazer 1890) is enduringly influential in interpretations of ancient cult stones, asserting that primitive humans believed every part of the natural world could be inhabited by supernatural spirits (Tylor 1871: vol. 2). Thus, natural phenomena such as falling meteorites, equipped with the power of motion, might be seen to be animated by spirits residing within.

The ambivalence or ambiguous quality inherent in aniconic cult stones poses significant challenges to their identification and interpretation archaeologically. However, their multivocality is central to their ritual value, through their accommodation of multiple individual ritual experiences in the context of shared ritual action; a single stone may evoke one or many divinities or spirits, and multiple aspects or manifestations of a single supernatural power, during a single moment and through time, rendering them useful in strategies of social cohesion.

Cultural Ecology in Archaeology

Santiago Mora
Department of Anthropology, St. Thomas University, Fredericton, NB, Canada

Introduction

From its very beginnings, anthropology has shown a marked concern for the environmental components that affect what anthropologists have deemed, at one time or another, to be the object of their investigations. This has given rise to countless proposals. Some of these identify factors in nature that limit the development of communities; others highlight the stimulus generated in societies by the same adverse environmental conditions they must confront. Some anthropologists have approached the environment-culture debate by evaluating the capacity of communities to adjust to their surroundings. In this way, they have identified social practices that help regulate the relationship between the environment and society – an emphasis that doubtlessly contributed to the development of the detailed examinations of current ethnography data that explained the functioning of those systems and a focus that ignored the history that set the stage for the present day. It is therefore not surprising that since the close of the twentieth century, the search for this history would take on an unusual relevance. The work of some anthropologists has gone beyond these

perspectives, questioning the separation between nature and culture. A dissection that seemed artificial, on the one hand, and ethnocentric, on the other, in contrast with those standpoints arrived at under other conceptualizations. It was possible that nature did not exist, at least not in the way that had been assumed for so long in the west. This idea allowed a questioning of the perception and analysis carried out within the Judeo-Christian tradition, the fundamental pivot that gave form to the modern world.

It is clear that the studies advanced by those anthropologists created disparate, contrasting perspectives. The very nature of these discrepancies is found in the views and the emphases that we have developed, in one time or another, to perceive these realities; no less important is the data that corroborate or refute these constructions. Under titles such as "Cultural Ecology," "Human Ecology," "Cognitive Anthropology," "Historical Ecology," and "Ethno-Science," to name just a few of those reference points, the field has advanced little by little in examining the world and its inhabitants, a process that feeds more and more on other areas and incorporates other disciplines.

Definition

This entry is written from a viewpoint that considered the complex relationship between environment and culture as part of a long history, which includes the dialectic transformative processes generated from the mutual relationship between humans and their surroundings (Crumley 2006). This relationship has not only contributed to the "intervention" of nature and the transformation of culture but opens up a space to reflect on the character of these relationships where explanations can be found – including the anthropological – that give form to the behaviors developed in one or other historical period.

Historical Background

In the New World, anthropology arose amidst reflection on the forms in which human societies developed in the geographical space they occupied. Its founder, a scholar with training in physics and geography, tried to understand cultures from a historical perspective, despite being aware of the importance of the geography they occupied. Thus, a theory was born – later known as historical particularism – in the writings of Franz Boas (1848–1942). Boas instilled in his students, among many other ideas, the concept of cultural relativism as well as a marked skepticism of the scope of the generalizations they can make. Despite this, it was under the guidance of Boas that one of his students – Alfred Louis Kroeber (1876–1960) – would concern himself with outlining guidelines that would be used to understand the relationship between cultures and the geographical spaces they occupied. In fact, this was the central theme of his book "Cultural and Natural Areas of Native North America," published in 1939. In this way, the concept of cultural areas was formulated, a concept that linked geographical zones with characteristic cultural forms and in which cultural change was explained as part of a continuous process of diffusion. Although this was not a new idea, the same had been expounded and extended from ethnographic data obtained by anthropologists such as Wissler (1870–1947) in the United States; at each recurrence, it became more attractive. In this way, a map was developed that "naturalized" cultures by linking them with specific geographical spaces.

This correlation between cultures and geographical spaces was revolutionized when the idea of adaptation was inserted. Julian Steward (1902–1972) proposed that the similarities observed between different cultures could be explained as convergences created by evolutionary processes. In these, the adaptations that came about would play a fundamental role. Possibly the most familiar example of the adaptation processes that Steward tried to highlight is found in his texts on the *Patrilineal Band* (Steward 1973). For Steward, this constituted a social type whose principal characteristics – patrilineality, patrilocality, exogamy, territorial appropriation, and the composition of lineages – are defined by the narrow limit of possibilities generated by the interaction

of a simple technology and specific ecological conditions (Steward 1973). In an atmosphere in which the key resource is found to be made up of nonmigratory prey widely distributed, it proves advantageous for groups to remain in the territory where individual members were born and to maintain a low population density. This was particularly true if the freight and transport systems were limited by simple human effort. The bond between the idea of evolution, which Boas saw as irrelevant in his time, and the concept of adaptation, bearing in mind the community structure in the light of its composition and the behaviors of its members, meant Steward's "Cultural Ecology" a powerful tool for understanding cultural change. After all, this theory had been designed to determine if the different adaptations to the environment generated transformations of an evolutionary character in society. However, the legacy of Steward was not limited to these ideas; Steward left us a clear methodology for embarking on the study of cultural change in which ecology was a central component (Steward 1977).

Steward was not the only researcher concerned with cultural evolution and its relationship with the environment, in the mid-twentieth century. Leslie White's (1900–1975) interest in this led him to design a model in which human societies were abstracted from three components – the techno-economic, the socioeconomic, and the ideological. White (1949) emphasized the first of these components, particularly the human capacity to develop technologies that allowed societies to "harvest" a progressive quantity of energy. For White, the energy extracted from the environment, multiplied by the efficiency of the technologies employed, would determine the level of cultural development reached. In this way, it was possible to organize human societies in an evolutionary continuum that implied a progression from the simple to the complex. This singular emphasis on technology contributed to the relegation of the ecological components to second place or, in the worst cases, to being viewed as constants. This vision reinforced the development of some environmental determinism. One of the most outstanding examples of this approach was carried out by Betty Meggers (1957) in her interpretation of Amazon prehistory. In this context culture was examined exclusively in function of its environmental productive capabilities. This interpretation was severely criticized. The oversimplification of the proposed models and the nature of the evidence supporting them placed in doubt the results presented.

Anthropology in the second half of the last century faced new challenges. Social problems and their correlation with ecological factors were evident. Pollution, desertification, and even the possible scarcity of freshwater began to take up more and more discussion space. Thus, the study of interrelationships between the domain of nature and that of culture took on an unprecedented importance. Undoubtedly, this contributed to the proliferation of proposals by anthropologists; the publications of the time reveal an explosion of approaches on this theme. Toward the 1960s, a new vision emerged. The work of Roy A. Rappaport (1926–1997) and Andrew Vayda explored ecosystems, in which humans were a fundamental part, from a perspective that viewed culture as an adaptive strategy. This approach was based on the general theory of systems, from which it was possible to insert human populations as one more element in the complex relationship between the biotic and non-biotic elements of an ecosystem. Cultural practices were, then, considered to be mechanisms whose purpose was to maximize adaptation, at the same time contributing to the conservation of ecosystems (Rappaport 1967). In fact, Rappaport's analysis of Tsembaga rituals indicated that they did not solely serve to validate and intensify the relationships that contribute to the integration of society, or to symbolically present the links societies forged with nature, but that they were also important regulatory systems of the relationship between human populations and the ecosystems these populations occupied. As Rappaport showed, many of these rituals helped maintain a balance between the populations and the resources used (Rappaport 1967, 1996). In the same period that Vayda and Rappaport carried out their work, Marvin Harris (1927–2001) published a study of the management and valuation of cattle in India. Harris (1966) saw in these practices an adaptive process

that had influenced Hinduism. For this author, the sanctification of the cattle and the abolition of its sacrifice for human consumption generated benefits that had been ignored by previous studies. Among those were found milk production, the use of dung as cooking fuel, and the use of the animals for hauling and agricultural labor. In short, Harris interpreted the behaviors from a point of view external to the values of the society in question, seeking to understand their possible adaptive function.

The approach of Harris, as well as the proposal of Rappaport and Vayda, was criticized for excessive functionalism; additionally, the work of the last two authors leads discussion toward the delimitation of terminology and the viability of quantifying its logical consequences in empirical form. Concepts such as population, homeostasis, equilibrium, dynamic equilibrium, retroalimentation, resilience, and charge capacity had empirical implications and forced their verification in the field, which was difficult to carry out given the type of information required and the problems inherent in the definitions applied (Friedman 1974).

As these discussions were taking place, on the ground, ethnographers were busy qualifying and quantifying the dietary composition of natives' societies. In this way, they hoped to assess actual consumption as well as the practices of appropriation and production used by small communities. Two themes complemented this work. On the one hand, an acute interest was developed in the ways decisions were made (i.e., Hames and Vickers 1982). This led to the construction of mathematical models that weighed up the investment and risk of success or failure in light of the results obtained from different production activities, a subject which proved especially revealing in the analysis of hunting.

On the other hand, attention was being drawn to the way the cosmologies of the premodern societies contributed to reinforcing practices that preserve the dynamic equilibrium of the ecosystems they occupied. A good example of this treatment is found in the article that Gerardo Reichel-Dolmatoff would publish in 1976 about cosmology as an ecological analysis.

The beginning of the 1990s saw a deepening of the study of ecological factors and adaptive behaviors. From "evolutionary ecology" (see Durham 1992), "human behavioral ecology" was developed (see Irons and Cronk 2000). This theoretical trend centered on the study of rules that define human decisions and the conditions in which these operate.

Basically, researchers were asking what ecological forces result from one behavioral alternative being selected above others. Unlike previous studies, they intended to study these practices in a broad context that included the whole of society. In another vein, they sought to generate models that could be corroborated empirically; simultaneously attempts were being made to formulate predictions about the future selection of behaviors.

Other theorists took a different route. By the early 1950s, the influence of Claude Lévi-Strauss (1908–2009) on anthropology had become patently obvious. Due to this, new subject matters took on an exceptional importance. In North America, this influence encouraged the development of orientations such as cognitive anthropology. This school of anthropological thought, arising from the study of languages, centered on the rational aspects of culture. It was accepted that marked, strong semantic categories across linguistic forms were related to meaningful cultural categories. This study hoped to improve understanding of how societies perceive, organize, and use culture. These anthropologists asserted that culture could not be seen as a material phenomenon, but is a form of knowledge that organizes the material forms (Tyler 1996).

One obvious consequence of this line of thought was the need to undertake a detailed inventory of the categories used for different societies and comparing them with those used in the west. An important example in this sense is the article that Harold C. Conklin published in 1955 about the definition and use of colors by the Hanunóo. From these reflections areas emerged that would gradually gain importance such as ethnoscience, ethnobotany, and ethnoecology; this last is understood to be the transcultural study of societies' manipulation of their environment.

The models generated by anthropologists up till then had dealt with "small-scale" societies that were seen as units isolated from the overwhelming movement of the West, a fiction of anthropological thinking that was difficult to maintain in the latter half of the twentieth century. The limits to resources being utilized to fulfill the needs of national societies and international markets obligated reconsideration of the levels of resolution that should be utilized, as well as the very nature of the problems.

Toward the 1980s, Eric Wolf (1923–1999) demonstrated the absurdity of maintaining a viewpoint that refused to recognize the history of some populations while omitting the impact of dominant societies (1982). "Traditional cultures" had their own history; a history that intersected with that of the West, a history on which the West had had a great impact; and a point of view that led to the revision of the anthropologists' daily tasks; three decades later, some anthropologists are still delving into this topic (Godelier 2009).

By the beginning of the 1990s, a remarkable quantity of data had been compiled. The point of view of the natives, and their knowledge accompanying the results presented by anthropologists, not only offered a new horizon for studies but revealed problems of appropriation of that knowledge. In the west, the avid traders of learning and matter began a process of legal appropriation of anything that offered the possibility of enrichment. After all, the research in some areas, such as ethnobotany, had been financed in part by companies that now tried to patent the results. In response, a strong activism arose among social and political groups. These movements gave greater meaning to the results of research that dealt with relationships between culture and environment. A second consequence of this environmental activism was to highlight the importance of certain geographical regions. Due to this, it is not surprising that the tropical regions – for example, the Amazon – have become the space where confrontation occurred between those concerned about the present and future of the populations and those who saw the exploitation of resources as a logical process for sustaining and increasing the inequitable economic growth that characterized the twentieth century.

The press was filled with images of those who participated in these conflicts; new leaders personified the social drama arising from the conflict generated by the diverse forms of resource use. The world stopped to watch and listen to what the poor country folk, such as Chico Mendes, had to say. The discussions between academics, despite being on a continuum, became polarized: some, principally biologists, saw indigenous or rural occupation of the areas they were trying to protect or conserve as a problem; others accepted that conservation was impossible without the participation of those same communities (Balée 1985; Redford and Sanderson 2000). A revised version of the notion of the "noble savage" returned to academic discussion. In parallel, studies moved away from a way of thinking that would view stability and balance as the nature of the systems studied. These new directions were documented utilizing new technologies, among which was found more and better satellite-generated images (such as Brondizio et al. 1994).

The growing polarization around environmental conflicts established a new alternative in anthropology: a politico-ecological anthropology opened a path that helped reinforce links to other fields such as ecology, biology, and geography; at the same time, it developed a strong critique to the implemented policies using terms such as "environmental rights," "resource ownership," and "territorial rights." The anthropologists' viewpoint enriched the debate with empirical data and new theoretical contributions and opened a discussion that cut across a good number of knowledge fields.

Key Issues/Current Debates

Since the turn of the century and in the first decade of the twenty-first century, three fundamental changes in anthropologists' work have become clear.

First, the examination of "the world" in some non-western societies reveals a more varied range of representations than what westerners included in dominion over nature. Complex cosmos organized under rules of kinship, affinity, and

opposition structure the relationship of universes that conceive "nature" as a continuum that can be described using the forms taken by social relationships. One conclusion has become clear: nature is society and society is nature. Thus, it becomes manifest that the vision that separated nature and culture was following the western historical development: an ethnocentric vision. This discovery led to the evaluation of the concepts underpinning the vision of the world on which the West had built a philosophical and economic system (Pattberg 2007). In another vein, this perspective enabled the comparative study of forms in which relationships are identified, qualified, and understood – the relationships between different forms of presenting the whole and the biases that define the cultures and their worlds.

Clearly the premises employed in these constructions establish different relationship forms, affecting the interactions generated between the different dominions (e.g., Descola 1996). This orientation not only influences the vision of the worlds built by natives but impacts the form in which the west has conceived its surroundings and has interacted with itself.

The environmental conflicts constitute a second topic of importance. During the 1980s arose, in an almost natural way, an alliance between local communities – indigenous and rural – and conservation groups.

The political plan of some, and the revindications that others were seeking, allowed them to identify common objectives. This alliance meant a figurative broadening, at the local and international levels, of the actions they wanted to carry out. Nonetheless, there was a contradiction between the two groups. At the international level, the conservationist wanted to use the local image to support their arguments; this implied the decontextualization and transformation of the localities. At the local level, the communities tried to reinforce and capitalize on the action with outside help, which forced changes to objectives, thus creating confusion among participants. The distance arising from these processes led to them growing apart and failing to understand the role that each played. The consequences did not take long to be felt. Possibly the clearest example of this lack of understanding is the assassination of Chico Méndez. In brief, there arose oppositions and contradictions that joined in with the already complex environmental conflicts. This situation was further compounded, on the conservationists' side, by their use of categories whose scientific application was, to say the least, incomplete but offered novel arguments valuable to the discourse. For example, terms such as biodiversity are part of a complex that goes beyond science, given that you are not trying to identify the composition and structure of "nature," but seeking to highlight the functional value of its present and future uses. In this sense, the category itself transcends science by placing the discussion in a form that relates it with the environment (Escobar 2005). In short, the critical analysis of the proposed discourse, and the activism on the part of anthropology sectors that advocate for an anthropology positioned face-to-face with the problems, constitutes an extremely important aspect in the present day.

Finally, work carried out since the 1980s demonstrated that the idea of worlds being untouchable, isolated, and free from human influence was nothing more than fantasy, an illusion built by a science that separated humans from the world they inhabited. More and more data corroborated the impact that human societies have had on the planet throughout history. Even those sites that not so long ago would have been considered untouchable have been affected and were in part the result of human activities. These observations were evidence of the magnitude of human influence on the planet. The loss of the ozone layer, attributed by many to recent human activities, or aspects of global warming are new phenomena; these are just two among the great impacts generated by humans throughout history. Without a doubt, a global history is emerging in which it is impossible to separate the human history of ecology from the ecology of history. The characteristics of the problems these approaches were tackling make it imperative to reconsider the resolution levels and the scales that must be employed.

One response to these necessities has been the development of historical ecology. This in itself comes as part of a multidisciplinary approach that

utilizes information such as the reconstruction of paleoclimates, as well as ethnographic, ethnohistorical, and archaeological data. One example would be the incorporation of geographical models to understand humans and their activities as an integral part of the planet on which they live. Highlighted in this approach is the human and ecological past viewed as a whole. It is now recognized that the environmental dynamic does not run parallel with human activities, but rather the two are as one, indivisible. In short, the proposition of historical archaeology is to understand the formation of present and past societies through an analysis of the complex relationships between humans and their surroundings in the light of the consequences of their interactions (Balée 1998, 2006). Landscape is a fundamental focus of analysis in these studies; it is seen as a point of interaction, with a temporal dimension both historical and cultural, at the center of evolution. It allows researchers to decode the interactions between humans and the environment during clearly defined periods. Nonetheless, investigators see how the landscape is in a continua state of physical and cognitive transformation.

Historical ecology currently faces several challenges. On the one hand, recognition of the cultural-ecological unity means combining approaches of different kinds. Models generated from the natural sciences tend to be deductive, while those created in the humanities are inductive; despite this, the two do try to give an account of the self-same reality.

It is necessary, then, to create and refine concepts, such as that of the landscape, in order to articulate these views, a job that is advancing with care (Crumley 2006). A second challenge lies in the resolution levels and spatial-temporal scales. The nature of the different data used, as well as their limitations, creates gaps and inconsistencies in the spatial-temporal scales of analyses. In this way, in some cases, the data contributes to an excessive extrapolation of the information which creates an illusion that detracts from the reality being studied. Finally, it is necessary to make note of one of the greatest advantages of historical ecology – its capacity to integrate diverse fields – which can lead to the use of categories under multiple definitions that are not always congruous. For example, the concept of history appears to have different connotations in the writings of ethnographers, archaeologists, and geographers (see Little 1999).

Future Directions

Far from the apocalyptic dreams presented by the communication media, humanity has before it some important challenges, but also opportunities. A growing number of people aspire to enjoy the same standards of living reached by the wealthiest countries. However, that well-being has been founded on an accelerated race to use and appropriate resources, on a global scale, which has contributed to inequities in other sectors. At the same time, a large proportion of the planet's inhabitants live in conditions of extreme poverty. The economic models used, as well as the premises on which the twentieth century is built, appear to be teetering.

At this crossroads, an anthropology interested in the environment should offer theoretical alternatives, while it continues its meticulous studies. This same anthropology should continue being critical and committed. If it is not capable of growing in this direction itself, it runs the risk of remaining condemned to live inhabit the world of sophists. Still, the recent literature suggests that anthropology has accepted the challenge.

Cultural Heritage and Communities

John Carman
Institute of Archaeology and Antiquity, University of Birmingham, Edgbaston, Birmingham, UK

Introduction

Cultural heritage is inevitably implicated in the creation of a sense of community (Howard 2003: 147–85; Byrne 2008: 170–1), and the management of cultural heritage has consequences for those communities and their heritage. Communities can be defined from the "outside" or can be self-defining. The concept of "community" is therefore never a straightforward identification

of "others" with whom archaeologists engage: heritage professionals too are a community among other communities, each with a claim on particular pasts and particular versions of those pasts. The role of the heritage professional can be a varied one, depending on context and the vision of the purpose of archaeology the professional espouses.

Definition

This section will explicitly avoid predefining its objects, on the grounds that what is at issue in the field of cultural heritage studies is precisely what the terms "cultural heritage" and "community" mean in any particular context, how they are applied, and to what they are applied (see, e.g., Tunbridge and Ashworth 1996; Carman 2002; Fairclough et al. 2008; Sørensen and Carman 2009).

Key Issues and Current Debates

Recent debates in the field of public archaeology have turned on two related issues:

- A recognition that the concept of "community" which is applied in the heritage field is one open to challenge and that communities themselves are at once varied and complex phenomena.
- The different forms of engagement that are at once possible and desirable (see, e.g., Carman 2005; Smith and Waterton 2009; Matthews et al. 2011).

Beyond this, there are questions concerning the role that heritage professionals play in their relations with communities.

Smith and Waterton (2009: 24–5) accuse heritage professionals generally of assuming that the communities with which they deal share particular characteristics, especially:

- Homogeneity
- A lack of internal conflict
- Locality
- Small scale

There is also a tendency to assume:

- That a community will preexist the arrival of the professional
- That such communities have an established sense of identity
- Grounded in what they perceive as their past as represented by certain kinds of material (Carman 2011).

However, and while they challenge this vision of community very effectively, Smith and Waterton (2009) and others (e.g., Agbe-Davies 2011) emphasize that the idea of "community" has a history, and the idea of what constitutes a community has changed over time. Moreover, how communities identify themselves – and indeed if a group of people choose to identify themselves as a community – is to be understood as much as a strategic and contingent decision as a statement of established identity (Agbe-Davies 2011). Smith and Waterton (2009: 25-7) emphasize how recent an arrival "community" is in archaeological concerns, at least in the UK: they date the first major period of interest to the 1970s and trace its gradual adoption in heritage policy until recent years has seen the concept used as a justification for official support for archaeology.

Types of Communities

Yvonne Marshall (2002: 216) suggests that in general archaeologists encounter two kinds of human community: one defined by geographical proximity to a heritage site is the "local" and the other defined by affiliation is the "descendant." These are not mutually exclusive categories: a "local" community may also be "descendant" (and vice versa). On the other hand, there is no reason for a "descendant" community to have any geographical connection.

The Indigenous community is a particular example of the descendant community (Smith 2004) and frequently taken as the model for archaeological consideration (see, e.g., Smith and Waterton 2009). There are, however, other

kinds of descendant community (see, e.g., Funari and de Carvalho 2011; Davidson and Brandon 2012). Diasporan communities may also claim affiliation with culture quite distant from them in space, such as communities who claim links with the culture of a place of origin: examples include African-Americans adopting specifically African aspects of dress and hairstyle, expatriate Irish who celebrate St. Patrick's Day, and others who retain the language, traditions, and dress of a distant or lost "homeland." However, descendant communities need not make heritage claims on the basis of direct or provable biological or cultural descent: modern British Pagans, for instance, may claim an association with prehistoric sites such as Stonehenge despite the lack of any demonstrated historical continuity between them and the builders of prehistoric stone circles; similarly, modern battle reenactors who name themselves for historic regiments can claim affiliation to sites where the historic regiment fought despite the lack of any historical continuity (Carman 2010: 197–8).

As Smith and Waterton (2009: 138) emphasize, however, heritage professionals such as archaeologists also constitute a community: they come together at conferences, through publication, and in other ways such as via digital technology (Smith and Waterton 2009: 119–37). They share a common set of understandings of what they do and why, which although subject to contestation between themselves (see, e.g., Hodder et al. 1995: 220–4, 228–9) necessarily excludes others (Hodder et al. 1995: 30–231). Increasingly, the languages in which archaeology is published have become fewer over the years (Kristiansen 2012), and archaeology is becoming increasingly professionalized across the world (Darvill 2012). As a result heritage professionals cannot be considered to be disinterested observers or managers, but rather to represent a particular set of interests.

Types of Engagement

Any kind of community may be involved in an emerging community archaeology project. The issue is primarily, however, not one of who is involved, but the nature of the involvement. In this connection, Stephanie Moser and her colleagues in Egypt (Moser et al. 2002: 221–3) note that there is a standard hierarchy of types of collaboration:

- "Outreach" represents a one-way process of communication and education.
- Beyond this is a willingness to recognize the contribution to knowledge and information others can make.
- Beyond this is an active process of consultation, most evident with Indigenous and descendant communities.

In going further, the project at Al-Quseir in Egypt involved a series of additional steps:

- Fostering social relationships with the local community
- Maintaining a presence in the community between fieldwork seasons
- Employing locals as part of the project
- Using locals as the means of outreach programs
- Ensuring the retention of remains retrieved locally in the local area (Moser et al. 2002: 223).

Similar ideas emerge from the work of Judith Field and her colleagues with the Aboriginal community at Cuddie Springs in Australia (Field et al. 2000: 43–4). Here, it was important to the community:

- That the archaeologists establish their integrity
- That they engendered trust
- That they encouraged active participation in the project, especially by employing members of the community in the work
- That they maintained a constant presence in the area
- That they conveyed information to the community members in ways to which they could respond
- As in Egypt, that locally found archaeological material remained in the area.

In both these cases, these factors contributed to a sense among the local community of the project

as something of direct relevance to them and in which they had a direct stake, both emotional and economic. It also engendered trust among them of the archaeological team, who arrived as strangers. In both cases, however, the community was involved after the researchers had established the grounds for the project.

A similar kind of project in Fiji (Crosby 2002) aimed to go a little beyond this by listing the requirements for a "true" community archaeology project, which are said to be:

- Initiation of the project by the local community
- A basis in local ideology and attitudes, linked to concerns for sustainable resource use
- The provision of expert advice from outside the community
- External (in this case, government) funding.

Here, the community calls upon others to undertake the work, which is then organized and financed from outside. Although dependent upon the willingness of professional experts to place themselves at the service of untrained locals and of government agencies to provide full financial support, which may be exceptional and peculiar to the Fijian context, there is nevertheless an indication here of a shift of power between the professional advisor and the community whereby it is the community that leads rather than the archaeologist.

"Democratic" archaeology projects take a similar approach. At Sedgeford in England, a local committee of trustees had control over the project as well as employing – indeed relying heavily upon – local labor, while hierarchical structures were minimal (Faulkner 2000: 31–2). In other cases, more formal structures serve to support community control. At the Levi Jordan Plantation site in Brazoria, Texas, USA (McDavid 2000), control over archaeological research and its public interpretation was in the hands of a board of trustees drawn from descendants of former owners of the plantation and those they enslaved and their representatives, the aim of archaeologists being to collaborate with members of local descendant communities in reciprocal, nonhierarchical, mutually empowering ways (McDavid 2000: 222). It is also clear, however, that any particular initiative required the permission of the trustees and that committee members were involved in every stage of the project and were seen as the "bosses" who directed the archaeologists; these were then concerned both to involve committee members and to be "involved in [committee members'] own agendas, according to… mutual needs" (McDavid 2000: 222). Nevertheless, McDavid admits that the committee members perceived her as the project leader, a role she both claimed and does not attempt to disguise (McDavid 2000: 222).

Carol McDavid takes an explicit approach to her work with African-American descendant communities, grounded in American pragmatist philosophy, which entails the establishment of a continuing "conversation" about issues at the site (McDavid 2000: 229, 2002: 305, 2009). In her work she emphasizes the diversity of backgrounds of committee members and of attitudes toward the site, both white and African-American, and draws upon the pragmatist approach as a way to accommodate this without closing the conversation. First, she notes how involving herself as one actor in a conversation among many serves to enhance her standing in the community, rather than diminish it: effectively by denying her own "expert" status as an archaeologist she is able to emerge as the community's expert (McDavid 2000: 230). Second, she sees how the abandonment of scholarly authority allows her to engage more closely with the more contingent and contextual interpretations of others' lives by those others (McDavid 2000: 230–1). Third, a pragmatic approach is about keeping the conversation going, not about winning arguments: accordingly, disagreements between actors become not problems to be overcome but opportunities to engage more deeply with colleagues (McDavid 2000: 231). The outcome is an approach grounded in four principles: reflexivity, multivocality, interactivity, and contextuality (McDavid 2002: 307–10), designed to maintain the conversation and by doing so to build trust with the community whose project it is.

Creating Communities

A function and opportunity frequently ignored is the capacity of the professional to construct communities through their work. In a series of case studies, Boyd et al. (2005: 98-107) indicate the processes by which professional interest in sites in Australia engendered the development of local interests and values built around differing attributes. Accordingly, they show how local aboriginal interests mostly focussed upon sites representing Indigenous and traditional attitudes to land and environment, or to the history of their engagement with incoming colonizers. European Australians also recognized such claims and sometimes the spiritual dimension these indicate. Others however were more concerned with current social and economic uses – as tourist sites, recreational space, or thoroughfares – although not all of these conflicted with Aboriginal conceptions: the attitude of skateboarders to a rock-art site, for instance, could be seen as another example of significance to a particular subculture (Boyd et al. 2005: 107). However, these values did not attach to the site until it became the focus of attention by researchers: it was by raising questions about such places that values were ascribed and which marked their importance to inhabitants of the locality and beyond.

The same set of processes was evident at the Hilton of Cadboll site in Scotland (Jones 2004). Here, excavation of the lower portion of an inscribed Pictish stone and its reconstruction ignited controversy over the ownership and placement of the reunited object, which was claimed both by the national museum in Edinburgh and the locality. Investigation of the contexts within which contemporary meanings for the stone are created identified a complex set of interlocking values. Academic and intellectual values included those of archaeology, art history, folklore, and oral history (Jones 2004: 27–33). In parallel to these, there was a more symbolic sense of its identity, as a living part of the community, and as an object "born" into the locality (Jones 2004: 33–7). As such it at once belongs to the community, is part of it, and is also constitutive of it: "as well as being conceived of as a living member of the community, the monument is also simultaneously an icon for the [community] as a whole" (Jones 2004: 37). This extends into the monument's role in the construction of a sense of place, and indeed of reforging a "lost" sense of community cohesion (Jones 2004: 39) that could be "healed" (at least symbolically) by reuniting the two original pieces of the monument.

A third instance is in the case of the commemoration of the 300th anniversary of the Battle of Oudenaarde in Belgium (Carman 2012). Here, a disinterested local population – many of whom who lived on the land where this internationally and historically important event took place – had to be transformed into a community of interest. A combination of public meetings and press stories, involvement of scholars from several countries, and active research on the battlefield all contributed to the emergence of a community who made a connection to both the place as a location of historical significance and to the memory of the event it signified. The result was the successful organization of a major commemorative event including a museum exhibition, a reenactment weekend, and an international academic conference. The sense of community interest thus created has since allowed ongoing research on the battlefield and encouraged the Flemish authorities to develop an inventory of historic conflict sites for purposes of heritage management.

In these cases "community" interest did not preexist scholarly attention to a particular site or monument. It was the presence and interest of scholars that incited such interest.

Activist Archaeologies

Questions as to the role of the professional with the communities with which or for whom they work inevitably embrace the degree to which professionals engage with the particular agendas of those communities. Some (e.g., LaRoche 2011; Levin 2011; Davidson and Brandon 2012) become involved in community projects in order to allow that community to reclaim part of its past and thereby to emphasize present inequalities; others (e.g., Saitta 2007; McDavid 2009) are more concerned to use the study of the past as a

means to engage directly with issues of inequality in the present. For the former, the past matters in itself as a means to empowerment, while for the latter the past is a mechanism to address current concerns. This kind of work has been called "civic engagement [which calls for] a commitment far beyond that of" conventional engagement with communities (Little 2007: 162).

Such agendas raise issues about how archaeologists can contribute to political, social, and economic change. One is to use archaeological interpretation to challenge conventional and expected understandings of current norms. Others take a different line – by directly involving non-archaeologists in the process of archaeological work. Whether you call this "community archaeology," "collaborative archaeology," or "democratic archaeology" (Carman 2005: 86–90), it works to challenge the idea that professionally trained archaeologists are the sole providers of archaeological interpretations and the only people qualified to undertake archaeological investigation. It involves abrogating some or all professional authority and putting professional skills and knowledge at the service of others who direct the project. Not only does this provide them with access to what is – after all – their past but also serves to undermine in a very direct and manifest way the structures of authority and power that are part of the modern order and in part invested in academic disciplines and agencies (such as those employing archaeologists) operating under the authority of law and government.

Conclusion

The topic of "cultural heritage and communities" is much larger than can be conveniently covered in the space allotted here. While heritage can be considered constitutive of community, the reverse is also true. The choices groups make as to what constitutes their heritage will define them as a community: while at the same time anything classed as heritage will serve to define the community to which it is deemed to be affiliated. In considering how communities relate to heritage and vice versa, it becomes necessary to make a decision as to the direction of the constitutive link. This then raises the question of the role of the heritage professional: in defining something as "heritage," the professional may also be defining a particular community of interest which may not otherwise be recognized by its members. In their activities professionals may also create communities of interest that did not previously exist – either by choice (as at Oudenaarde) or by other processes (as recorded in Boyd et al. 2005) – which must then not be identified as preexisting. Others go beyond this by adopting the agendas of the communities with which they work, becoming at once part of the community and serving it.

The result is a complex set of relationships that are impossible to analyze in an entirely disinterested manner, since the researcher is inevitably implicated in the process of community construction and maintenance. As we increasingly come to recognize this, the processes of archaeology in the public arena become the subject of research in their own right.

Cultural Heritage and Foreign Investment

Valentina Vadi
Lancaster University Law School, Lancaster, UK

Introduction

Defined as the scientific study of the material remains of past human life and activities, archaeology seems to have very little to do with international investment law, the field of public international law governing foreign investments. Archaeology and international investment law seem to constitute different fields of study, with different aims and objectives. Archaeology studies material objects and aims to illuminate the past. International investment law addresses current issues, governs foreign investors and their investments, and aims to protect them against abusive behavior of the host state and to contribute to the sustainable development of the same. Nonetheless, in the past decades, foreign investors have invested in areas with important archaeological artifacts or constituting significant cultural landscapes, and questions have arisen about how to balance investors' rights under the applicable investment treaties and the state right to protect important archaeological artifacts, architectural features, and landscapes (Vadi 2014). Not only is the right to regulate cultural resources an intrinsic element of state cultural sovereignty, but it is also increasingly recognized under international law. After briefly introducing the field of international investment law and arbitration, this entry will discuss the key issues arising from the clash between the protection of archeological and cultural artifacts and the promotion of foreign investments in international investment law and arbitration, by referring to some paradigmatic examples. Then, it will discuss some current debates and conclude by illuminating some future directions.

Defining International Investment Law and Arbitration

The law of foreign investment is one of the oldest and most complex areas of international law and has gained preeminence in the field. More than 3000 international investment agreements (IIAs) govern foreign investments and provide foreign investors with direct access to international arbitration. States have signed such treaties to attract foreign investment and accord adequate legal protection to their investors. Rare in international law, these treaties give private parties standing to arbitrate disputes under international law and then enforce any award in their favor in domestic courts of the host country. Without the possibility of domestic enforcement, awards would be meaningless. Investment treaties provide extensive protection to investor rights in order to encourage foreign investment and foster economic development. While investment treaties differ in their details, their scope and content have been standardized over the years, as negotiations have been characterized by an ongoing sharing and borrowing of concepts.

At the substantive level, investment treaties broadly define the notion of foreign direct investment (FDI), which typically includes ownership in businesses operating outside the country of origin of the investor, and provide protection against discrimination, fair and equitable treatment, full protection and security, and assurances that the host country will honor its commitments regarding the investment. Other common

provisions in investment treaties concern the repatriation of profits and prohibit currency controls that are worse than those in place when the treaty was signed. Investment treaties generally guarantee compensation in the event of nationalization, expropriation, or indirect expropriation and clarify what level of compensation will be owed in such cases.

At the procedural level, most IIAs provide investors direct access to an international arbitral tribunal. In so doing, they create a set of procedural rights for the direct benefit of investors. This is a major novelty in international law, as customary international law does not provide such a mechanism. The rationale for internationalizing investor-state disputes lies in the intended depoliticization of such disputes. The home country is no longer involved in litigating international disputes on behalf of its affected citizens; the host country is no longer subject to the political and/or military pressures of the so-called gunboat diplomacy. The affected investor is no longer subject to the vagaries of diplomatic protection, which entitles the home state to file a claim against the host state for wrongs committed against the citizens of the former state but that is traditionally perceived to be a right of the home state rather than a duty of the same. Arbitral awards shape the relationship between the state, on the one hand, and private individuals on the other. Arbitrators determine matters such as the legality of governmental activity, the degree to which individuals should be protected from regulation, and the appropriate role of the state.

Key Issues

When countries pursue economic growth, their policy makers may have an incentive to lower cultural standards to promote economic activities. If states nonetheless maintain a high level of cultural heritage protection, disputes may arise as foreign investors can claim that such policies affect their economic interests thereby breaching investment treaty provisions (Vadi 2012). Given the extraordinary increase of foreign investment flows in recent years, the privileged regime created by international investment law within the boundaries of the host state has increasingly determined a tension between investors' rights and cultural heritage protection. In some cases, foreign investors have claimed that cultural policies negatively affected their investment, thereby amounting to indirect expropriation. In other cases, the investors alleged discrimination and/or violation of the fair and equitable treatment standard. In sum, there is a variety of potential conflict areas between investor rights and cultural policies relating the protection of archaeological artifacts (Vadi 2012).

Examples

Three examples may clarify the issues at stake. In the Glamis Gold case, a Canadian mining company planned to mine gold on federal land in southeastern California (the Imperial Project). Because the area in and around the Imperial Project was used by precontact Native Americans as a pilgrimage route, the Quechan, a Native American tribe, opposed the project as it would destroy the Trail of Dreams, a sacred path still used for performing ceremonial practices (Vadi 2011). The Department of the Interior withdrew the Imperial Project from further mineral entry for 20 years to protect historic properties. In 2002, however, permission for the project was granted, and the State Mining and Geology Board enacted emergency regulations requiring the backfilling of all open-pit mines to re-create the approximate contours of the land prior to mining.

According to the claimant, however, not only did the US Interior Department fail to promptly approve the project, thus unreasonably delaying its mining operations, but California's regulation requiring the backfilling of open-pit gold mines also made its mining operation uneconomical. Therefore, the investor claimed inter alia that the United States had expropriated its mining rights in violation of Article 1110 of the North American Free Trade Agreement. According to the claimant, the expropriation began with the federal government's refusal to approve the claimant's plan of operations and continued with the backfilling requirement. In particular, backfilling would be

uneconomical and arbitrary since it would not be rationally related to its stated purpose of protecting cultural resources. The claimant argued that whereas taking gold out of the ground destroys any cultural resources on the surface, putting the dirt back in the pit actually does not protect those resources but may lead to the burial of more artifacts and cause greater cultural loss (Vadi 2011).

In its award, the Arbitral Tribunal held that the complained measures did not amount to an indirect expropriation. Not only did not they cause a sufficient economic impact to Glamis' investment, but they were also rationally related to their stated purpose. The Tribunal admitted that "some cultural artifacts will indeed be disturbed, if not buried, in the process of excavating and backfilling," but concluded that, without such measures, the landscape would be harmed by significant pits and waste piles in the near vicinity (Glamis Award, Vadi 2011). Remarkably, the Arbitral Tribunal also expressly referred to Article 12 of the World Heritage Convention, which requires States to protect their cultural heritage even if it is not listed in the World Heritage lists. This is rather extraordinary, as cultural heritage experts have repeatedly stressed that Article 12 of the WHC is an often-neglected provision.

In *Southern Pacific Properties (Middle East) Limited v. Arab Republic of Egypt*, the arbitration involved the development of a tourist village at the pyramids of Giza. During construction, artifacts of archaeological importance were unearthed. Therefore, notwithstanding the previous approval of the investment at stake, Egypt canceled the project and the area was added to the World Heritage List (Vadi 2014). The ICSID Tribunal noted that certain acts of Egyptian officials "created expectations protected by established principles of international law" and that the listing had been requested after the cancelation of the project (SPP v. Egypt, Award, Vadi 2014). Therefore, it found contractual liability and sustained the Claimant's argument that the particular public purpose of the expropriation could not change the obligation to pay fair compensation.

In *Malaysian Historical Salvors v. Malaysia*, the arbitration centered on the question as to whether a salvage contract for the finding, identification, and recovery of an ancient shipwreck constituted an investment, thus receiving protection under the UK–Malaysia Bilateral Investment Treaty (BIT). Malaysian Historical Salvors (MHS), a British salvage company, entered into a contract with the Malaysian Government to locate and salvage the cargo of the *Diana*, a vessel licensed by the East India Company that mysteriously sank in the Straits of Malacca on 5 March 1817 (Vadi 2014). Under the terms of the contract, which was on a no finds-no pay basis, all the costs of the salvage and its risks would be borne exclusively by the salvage company. Artifacts directly related to Malaysian history and culture would be retained by the Government for study and exhibition in the National Museum, while the other recovered items would have been auctioned in Europe. The Malaysian Government would receive the sale proceeds, while paying a percentage of the sum to the company. The salvage efforts took almost 4 years; when MHS found and salvaged the sunken vessel, it recovered nearly 24,000 complete pieces of Chinese blue-and-white porcelain. The dispute arose with regard to the proceeds of the auction and the quantity of items which Malaysia withheld from sale. As MHS contested the amount of the salvaged items which were withheld from sale, the company commenced arbitration proceedings against the Malaysian Government in Kuala Lumpur. As the award dismissed the claim, and every challenge failed, the claimant filed a Request for Arbitration at the International Center for the Settlement of Investment Disputes (ICSID) in Washington DC, contending that there was a violation of the UK–Malaysia BIT. In particular, the claimant argued that its performance under the contract fell within the meaning of investment and that, accordingly, it was protected under the BIT. Substantially, the investor contended that the respondent had violated BIT provisions concerning protection of investment and expropriation. For its part, the respondent objected to jurisdiction over the dispute, arguing that the contract was not an investment. This line of argument was upheld by the sole arbitrator who dismissed the claim on jurisdiction (MHS v. Malaysia Award, Vadi 2014).

The arbitrator considered that the nature of the claimant's activities was largely similar to that of a commercial salvage contract and that an ordinary commercial contract could not be considered as an investment. The majority of the Annulment Committee, however, held that a salvage contract is a form of investment, on the basis of the broad definition of investment provided by the UK–Malaysia BIT. Therefore, it concluded that the Tribunal exceeded its powers by failing to exercise jurisdiction with which it was endowed by the UK–Malaysia BIT and the ICSID Convention and that it manifestly did so because it did not consider the definition of investment provided by the same BIT (MHS v. Malaysia, Decision on the Application for Annulment, Vadi 2014).

These arbitrations took place in different locations and concerned facts taking place in the American, African, and Asian continents, respectively. They were conducted by different arbitral tribunals under different international investment treaties and concerned different subject matters and causes of action. One may legitimately wonder whether there is any commonality between these awards. One may also question the relevance of discussing previous awards, given the fact that there is no binding precedent in international (investment) law. Nonetheless, investment arbitrations – while not binding on each other – have become the most important source of international investment law. Moreover, these awards show an increasingly frequent pattern in the reference to cultural heritage protection in investment treaty arbitration. Cultural heritage issues arise in a variety of contexts, delimiting substantive standards of protection and even quantifying damages. The study of previous awards is useful because patterns of consistent use can and do influence subsequent awards. Moreover, many other investment arbitrations clearly involve cultural heritage and archaeological artifacts (Vadi 2014).

Current Debates

The interplay between investors' rights and cultural heritage protection raises a number of questions. First, have arbitral tribunals paid any attention to cultural heritage? If so, how have they balanced investors' rights and the cultural policies of the host State? Second, what values and interests are at the heart of their thinking and practice? Third, is investor-state arbitration a suitable forum to protect the public interest? Finally, if one admits that adjudication is a bottom-up mode of governance, and has a fundamental importance with regard to the concrete implementation of a given legal regime, then analyzing the adjudicative patterns of cultural heritage-related investment disputes also tests the effectiveness of international investment law and, indirectly, of international cultural heritage law.

Recent studies have shown that arbitral tribunals have increasingly considered the protection of cultural heritage as an essential aspect of state sovereignty (Vadi 2014). The interaction between international investment law and cultural heritage law has been productive, in showing the gradual emergence of customary norms requiring the protection of cultural heritage in times of peace (Vadi 2014). This is a significant outcome, as most scholars have pinpointed the existence of customary norms requiring the protection of cultural heritage in times of war (Forrest 2014; Venturini 2016). The jurisprudence of arbitral tribunals is thus contributing to the development of international law requiring the protection of cultural heritage (Vadi 2014).

Nonetheless, cultural values and interests are not necessarily at the heart of arbitral thinking and practice. The available jurisprudence shows the need to reinforce the protection of cultural heritage, for instance, by introducing specific reference to cultural concerns such as cultural exceptions or carve-outs in international investment treaties, in order to prevent a "culture clash" between investors' rights and the host state's protection of cultural heritage (Vadi 2014). Rather than considering cultural heritage as an exception to treatment standards or as a defense justifying State measures, arbitral tribunals have considered heritage protection as a legitimate objective pursued by the host state when such tribunals interpreted and applied relevant investment

treatment standards. Much remains to be done to successfully accommodate cultural heritage considerations within international investment law and arbitration. Arbitral tribunals are of limited jurisdiction: they are required to check whether state conduct complied with its investment treaty obligations. They are not required to adjudicate on state's compliance with its obligations under international cultural law. Therefore, requiring investor's compliance with domestic laws and regulations in the text of the relevant international investment agreements can reinforce the state right to protect its cultural heritage. Inserting the possibility for states to bring counterclaims in case of investor's major breaches of domestic laws can also add teeth to these provisions.

Much ink has been spilled on the question as to whether investor-state arbitration constitutes a suitable forum to protect the public interest. This dispute settlement mechanism has become the object of intense scrutiny in the past few years. Even if one assumes that it is desirable to promote foreign investment in order to foster economic development, the argument goes that some rules of international investment law can hurt host states by limiting the state's ability to protect its cultural heritage (Ratner 2017). Moreover, investor-state arbitration is based on a model of commercial arbitration that seems ill-suited to deal with (international) public law issues. Because arbitral tribunals are not generally subject to an appeal mechanism, inconsistent awards have resulted.

Future Directions

What could be done to improve the situation? What techniques are available to avoid collisions between the protection of foreign investments and the safeguarding of cultural heritage? From a procedural perspective, countries and commentators have proposed a range of alternatives moving toward some judicialization of investor-state arbitration (Roberts 2018). While a discussion of the various reform proposals is outside the scope of this entry, it will suffice to mention the fact that some reforms can actually foster the consideration of important policy objectives, including the protection of archeological artifacts, a special type of cultural heritage. The establishment of a Multilateral Investment Court, a proposal backed by Canada and the European Union, can contribute to the development of a relatively consistent jurisprudence (even in the absence of binding precedent in international law). Tenured judges may be perceived to be more independent and impartial than ad hoc arbitrators. Their background might be in international law and public law rather than commercial law, and this can favor a more balanced assessment of potential clashes between the safeguarding of cultural heritage and the promotion of foreign investments. The establishment of appeals mechanisms, an initiative adopted by countries such as the United States in some of its BITs, can also provide an additional layer of scrutiny. Nonetheless, the establishment of a permanent world investment court does not necessarily offer a magic formula for balancing the various interests at stake; substantively, further reflection is needed.

Substantively, customary norms of treaty interpretation enable arbitral tribunals to consider cultural concerns within the current framework of international law. When they interpret international investment law, arbitral tribunals can use systematic interpretation and consider other international law commitments of the states, including UNESCO Conventions. Moreover, as states periodically renegotiate international investment treaties, they can expressly accommodate cultural concerns in the text of these treaties. For instance, Canada has inserted specific clauses protecting the cultural industries in the recent EU–Canada Comprehensive Economic and Trade Agreement (CETA). This clause can allow Canada to protect its cultural industries without the fear of expensive investment claims. While only a few investment treaties include a "general exceptions" clause, such clause might be inserted in future treaties. A parallel inclusive way states can build some safeguards within international investment treaties is by requiring compliance with domestic law (Vadi 2019). For instance, states can clarify that the relevant investment treaty protects only those investments that comply with domestic law.

Such a clause can enable an adaptation of the treaty to the social, cultural, and political needs of the state. Recent international investment agreements tend to add such legality requirements (Vadi 2019).

C

Cultural Heritage and Sustainable Development in Ghana

Jane Osei
Department of Public Administration and Health Services Management, University of Ghana Business School, Legon, Accra, Ghana

Introduction

The interconnectedness between culture and development is vigorous (Arthur and Mensah 2006). Cultural heritage can enhance economic development at both national and local level through job creation, tourist attraction and investments, relaxation, and recreation (Communities and Local Government 2009). Currently, in Africa, it has become an urgent matter to recognize the important role of cultural heritage in sustainable development (Mawere 2015). The cultural and natural diversification of Africa is often linked to its long history. However, the African local government strategies on culture and heritage policies have been given little attention (Barillet et al. 2006). In Ghana, many heritage assets have been destroyed without considering future generations. Most historic buildings, heritage assets, and other assets of historic importance have been destroyed or abandoned (Ghana Vision 2020). This failure to sustain key cultural heritage assets has limited the achievements of sustainable development in Ghana.

Definition

The World Commission on the Environment and Development (1987, p. 43.) has defined sustainable development as "development that meets the needs of the present without compromising the ability of the future generations to meet their own needs." Cultural heritage on the other hand is the transfer of lifestyle in the form of assets, customs and traditions, values, norms, etc. from one generation to the other. Cultural heritage could be either tangible or intangible (International Council on Monuments and Sites (Charter 1999). UNESCO (1972) describes cultural heritage as monuments, group of buildings, and sites which are of a distinguished ubiquitous value passed on from generation to generation. The definitions by the World Commission on the Environment and Development and UNESCO are the operational definitions for this study. In almost about 50 years now, Ghana has been a part of the international heritage community (Fredholm 2016). It ratified the UN convention on protecting natural and cultural heritage in 1972. The intangible cultural heritage of Ghana is currently been safeguarded by the development of an enabling environment (UNESCO 2019). In December 2018, for instance, Ghana organized a needs assessment validation workshop to identify the needs for protecting intangible cultural heritage (UNESCO 2018).

Key Issues/Current Debates/Future Directions/Examples

The recognition of cultural heritage in the sustainable development agenda is peripheral (Nocca 2017). This is evident as it appears just once in the sustainable development goals (SDGs). Specifically, it is mentioned in SDG target 11.4 which states that "strengthen efforts to protect and safeguard the world's cultural and natural heritage"; this is out of the 169 specified targets. It is however not specific to cultural heritage which is mentioned together with natural heritage.

Ghana is located in West Africa around the Gulf of Guinea with its economy recognized as part of the fastest-growing economies in Africa (USAID 2012). Since independence, Ghana has initiated a number of policies, strategies, and programs to speed up the economy. According to Insoll (2008, 10), Ghana's recent interest in the possible use of culture for development has increased with the aim of making its cultural heritage an archetype of tourism in Africa (Insoll 2008). However, many of the safeguarding mechanisms are aligned around Ghana's forts and castles (Boswell and ÓKane 2011). The government of Ghana has been condemned for its inability to incorporate issues of cultural heritage in the developmental goals, plans, and designs of the country. Most professionals in the heritage industry have suggested that Ghana needs a more coherent policy (Fredholm 2016).

In most developing countries like Ghana, investments toward cultural infrastructure are very few (Bandarin et al. 2011). However, Ghana has a mandate in Article 39.4 of the 1992 Constitution to preserve and protect places of historical interest and artifacts. Again, the cultural policy of the country emphasizes an obligation to develop cultural assets and heritage and also appreciate and promote usage (The Cultural Policy of Ghana 2004). In this regard, the country has made a conscious effort to sustain its cultural heritage. Recently, the World Heritage Convention approved Ghana's requests for international assistance for its cultural heritage based on the urgency of the request. This included an amount of USD 85,086 for the "Preparation of a management plan for the Forts and Castles of Ghana" under the Conservation and Management Culture budget (UNESCO World Heritage Centre 2018). Regardless, the index of development of a multidimensional framework for heritage sustainability presents a final report of Ghana's heritage sustainability at 0.53/1 (UNESCO 2013). Though this is an intermediate result, Ghana still has a lot more to do in order to sustain its cultural heritage.

Currently, Ghana has incorporated Ghanaian Language and Culture into its basic education curriculum to help the youth have a basic overview of the Ghanaian culture to impact future generations. Ghana's commitment level and activities by authorities fluctuate according to the

multidimensional framework. In analyzing the framework, it is realized that though 50% of Ghana's cultural asset is protected, managed, and safeguarded, 26% of the cultural asset have not been registered and inscribed (UNESCO 2013). This gap therefore calls for a registry and inventory of intangible heritage assets in Ghana.

Efforts made by the public have been devoted to the creation of awareness and establishing a national record of tangible heritage assets. The awareness creation strategies adopted include workshops and sensitization programs (Arthur and Mensah 2006). The efforts undertaken are evident in the statistics of the multidimensional framework which indicates a 73% record for communicating and marshaling support for cultural heritage in Ghana. Though a lot has been done toward awareness creation, efforts made to attract the support of private sector and civil society have been minimal (UNESCO 2013). It is therefore important for Ghana to further explore the engagement of civil societies and private sector in protecting, communicating, and promoting its cultural heritage.

The cultural heritage of Ghana serves as a tourist investment for the country and its future generations. According to Heritage (2009), cultural heritage in itself can enhance local and national economic development through job creation which will in turn attract investment and tourism as well as recreation and leisure provision, hence the need to manage cultural heritage to generate economic and social benefits for their host communities (Hampton 2005). The Ghana Museums and Monuments Board (GMMB) was established in 1957 and governed by the National Liberation Council Decree (NLCD) Act 387, 1969, to legally serve as custodians and managers of the material (mobile and immobile) cultural heritage in Ghana. For instance, the board protects the Cape Coast and Elmina castles as well as the Fort St. Jago making them integral to Ghana's tourist attraction. Other forts including James Fort, Accra, and Fort William, Anomabu, have however been abandoned.

Researchers and practitioners in the past 10 years have argued that preserving cultural heritage yields multifaceted benefits (Nocca 2017). However, issues of cultural heritage in our cities have been left out of most developmental policies and programs other than being prioritized for formal management (Nocca 2017). In Ghana, many historic sites, buildings of historical importance, and sites of scientific interest have all been destroyed without protection for the future generations according to Ghana vision 2020 (Arthur and Mensah 2006). Other cultural heritages have been modernized hence losing the touch of culture in them.

The convention for protecting intangible cultural heritage was approved by UNESCO in October 2003 and enforced in April 2006 (Blake 2018). This saw a number of countries ratifying the convention with currently about 172 countries' representatives of regions across the world (Blake 2018). As Ghana also has ratified the UNESCO Convention on cultural heritage, it is expected that it will intensify promotion of its cultural heritage. This could be done through storytelling and writing or by revisiting the strategies of the likes of Ama Ata Aidoo and Efua Sutherland who used their books to promote and preserve the culture of Ghana. In the past preserving Ghana's cultural heritage involved the use of documentaries and audio visuals for the transmission of knowledge to future generations. Sustaining cultural heritage in Ghana requires a high level of financial, technical, and legal expertise. In order for Ghana to safeguard its cultural heritage, it is important to invest in this sector.

Cultural Heritage and the Public

Pamela J. Cressey[1] and Douglas Appler[2]
[1]Alexandria Archaeology, Alexandria, VA, USA
[2]Department of Historic Preservation, University of Kentucky, Lexington, KY, USA

Introduction

Few communities have enjoyed as long and productive a relationship with their archaeological heritage as has the City of Alexandria, Virginia. For more than 50 years, beginning with the archaeological investigation and restoration of Fort Ward in 1961, archaeology has played a major role in shaping the city's identity. In the mid-1960s, residents forged an innovative partnership with the Smithsonian that linked Urban Renewal to archaeology – while other cities were losing their past, Alexandrians were rediscovering theirs. Again with resident impetus, in 1975, the City formed its own archaeological commission to guide the direction of archaeology with non-professional volunteers, and 2 years later, it hired its first professional archaeologist. Volunteers carrying out a variety of tasks – studying documents, processing artifacts, excavating sites, commission members, artists, educators, students, museum visitors, descendants of those buried in cemeteries, developers and other supporters – have helped

to define the character of archaeology in Alexandria, both how it is carried out and how archaeological information reenters the modern world. The City and developers have created parks, reconstructions, preserves, trails, memorial spaces, and interpretive signs on archaeological sites from all eras; public art has been commissioned to commemorate historical events and to honor the lives of earlier generations of Alexandrians whose stories have been pushed to the margins of history. In short, Alexandria provides a great example of what can happen when a community embraces its archaeological heritage.

Definition

Archaeology in Alexandria brings together the resources and authority of local government, the skills of professional archaeologists, and perhaps most importantly, the interest and enthusiasm of residents to form a unique environment in which the community decides how archaeological information reappears on the modern stage. With the management of the City's archaeologists, this arrangement allows Alexandria's archaeological record to be discovered, preserved, and protected using professional standards and current best practices. This process is conducted in such a fashion that the identification, interpretation, and long-term use of archaeological sites are carried out in accordance with the values and priorities of the local community. As a result, the public is able to take archaeology in directions that may be completely unexpected by archaeologists, and which are more likely to draw the interest and continued support of city residents.

In the United States, the legal protection offered to archaeological resources located on private land is almost nonexistent. While Section 106 of the National Historic Preservation Act requires an evaluation of how proposed projects may impact historic resources on federal land, or how federally funded or permitted projects may impact privately owned historic resources, private development on private land almost never includes this process for archaeological resources. Since private land use regulation is generally carried out by local government, the only way in which archaeological protection can occur is if the thousands of city and county governments in the United States adopt their own regulations. While many communities control actions on historic structures, only a handful regulate archaeological resources. Alexandria, fortunately, is part of this select group.

Alexandria's progressive approach to the management of its archaeological heritage is in many ways a result of the city's citizen-led advisory body, the Alexandria Archaeological Commission (AAC). The AAC recommends actions to City Council regarding Alexandria's archaeological heritage. It was established after the Urban Renewal projects of the 1960s exposed the vast, rich, and significant archaeological materials buried underground. Its citizen members are not required to have archaeological training. The major assets of AAC members through the years have proven to be their willingness to fight for the preservation and contemporary use of the city's buried past, and their insider's perspective on the possibilities of using archaeology within their own community. The Alexandria Archaeological Protection Code (AAPC) offers an example of how these traits have combined to better protect the city's 13,000-year heritage.

The AAPC was first conceptualized by members of the AAC even though the City archaeologists did not consider a local code a possibility. The AAC members met for years to consider methods of regulating development so that archaeological resources were not unconsciously destroyed. Given their commitment to the concept that developers should share with the City in the responsibility to search, study, and share the past, an interesting partnership emerged. Development attorneys helped craft a code which outlined a specific process to be conducted before site construction, thereby reducing what their clients feared most – surprises, delays, and unbudgeted costs. A strong AAC chairman, the support of local archaeology enthusiasts, a long history of community preservation, and goodwill generated

by the City's archaeological activities assisted in producing the unanimous City Council vote in September 1989.

The Alexandria Archaeological Protection Code mandates that archaeological review become part of the private land development process. New developments that require a site plan (this includes nearly all new projects proposing the construction of more than two housing units) also require archaeological review. Approved preliminary and final site plans contain conditions to ensure archaeological assessment, evaluation, preservation, long-term care of collections, and public interpretation.

Key Issues/Current Debates/Future Directions/Examples

A key management tool in Alexandria is the staff's access to a large quantity of historical data organized spatially for reviewing site plans, as well as projects going through the Board of Architectural Review and building/demolition permits. Volunteers, students, and staff have collected this information on thematic maps and files, as well as developed GIS overlays using historical maps. In the first step of the City's review process, staff consults all the data for the site plan location to assess whether there is a possibility that archaeological resources can be damaged by the proposed project. If this is the case, conditions are written to require the developer to hire professionals to prepare an Archaeological Evaluation Report and a Resource Management Plan, outlining the results of documentary research and field investigations, stating site significance and recommending a treatment plan to protect some resources and/or recover those that would be lost. The City archaeologists write scopes of work for these products, and review and approve the work to assure consistency with professional standards, accuracy, and contribution to the public's knowledge. The plans may call for the excavation of portions of the site and preparation of a report, or they may find other appropriate methods for protecting and possibly interpreting the site's archaeology for the public.

Cultural Heritage in the Digital Age

Fathi Saleh
Department of Computer Engineering, Cairo University, Cairo, Egypt
CULTNAT Center for Documentation of Cultural and Natural Heritage, Giza, Egypt

Introduction

We are living now in the twenty-first century, at the height of the new era of *Information Technology*. Behind us, we have a rich, inherited, human culture that goes back over five millennia. With the technologies we have in our hands today, we can really preserve this heritage of the past and showcase it to future generations in an unprecedented way. In this entry, we are going to investigate the evolution of *documentation technology* from ancient times up until today. And, at the

same time, we will also investigate the different aspects of this cultural and natural heritage, and finally explore how we are using these developed technologies to preserve our heritage. To conclude, we will investigate the prospects for the future and how we will view our heritage.

Key Issues

Technology: From Hieroglyphs to Cyberspace

Human beings started, about 20,000 years ago, to draw rock art on the walls of caves. Five thousand years ago, man started to engrave his hieroglyphs on stone walls in Egypt, and to inscribe mud tablets with what is known as cuneiform in Mesopotamia.

Five hundred years later, Egyptians began to use papyrus as a wonderful medium for writing. Papyrus is made out of the stem of the papyrus plant, which is about 2-cm wide. This stem is cut into long strips. These strips are then laid down beside each other and covered with another layer of strips perpendicular to them. The two layers are then pressed together to get rid of the moisture, before being left to dry. We are finally left with a sheet which is a little bigger than the A4-size sheets that we use today. Several of these papyrus sheets were stuck together to form a scroll that could be as long as a few meters.

About 1500 BCE, Egyptians began to use a third medium. This medium was *ostraka*, fragments of broken pottery. About CE 1000, another medium appeared, known as "paper," a word derived from the word "papyrus." In addition to this, Egyptians started binding sheets together to create what was known as a codex, which we all refer to today as a "book."

They also started using another new material – parchment – which competed with paper and papyrus. Parchment is made from the skin of certain animals.

In the fifteenth century, Gutenberg made a real leap in the progress of humanity by inventing his printing machine.

Humanity continued reading books for more than 500 years till a new medium was invented – the digital computer. The first digital computer was introduced in 1945. It was, physically, a very big machine and owned by organizations rather than individuals.

Personal computers first became available in the early 1980s. In the 1990s, computers became far more sophisticated, starting to employ different media such as sound, images, and videos – what is known as multimedia.

In the mid-1990s, small computers started to possess the capability to handle maps, with what is known as the *Geographic information system* (GIS). GIS allows information to be positioned on maps, according to longitude and latitude.

Of course, the really big breakthrough in the 1990s was the advent of the *Internet*. The Internet has taken the world to another dimension, in which all information is shared between subscribers around the world, in what is now known as cyberspace.

In cyberspace, people are connected. Information can be stored in a computer server anywhere in the world and accessed by many people around the world. Compare this with a book that you keep on a shelf in your home and that can only be accessed by yourself.

In cyberspace, you can communicate with someone or many people at the same time, without having to resort to the postal service or a telephone. In cyberspace, you can access an unlimited number of books and publications without having them physically with you in your home or office.

In cyberspace, you can download any video or soundtrack you want to have. In cyberspace, you can share your albums of photos and videos with other people on what is known as YouTube.

In cyberspace, you can have your own space with multiple applications that you can share with your selected friends. Cyberspace has created a cyber social network, in which people from different parts of the world can communicate live in an unprecedented, spontaneous way.

At the moment, we can say the physical books live side by side with digital space. But for how long this state of affairs might continue, nobody knows. Each medium has its own merits.

Remember that in the old seaport of Alexandria, a few years ago, divers found some blocks of

stones on the seabed that were thousands of years old. Experts carefully cleaned them and then deciphered the ancient hieroglyphic inscriptions on them. Now imagine immersing your computer in a bucket of water for a few seconds. You would not dare do it, as all the information you had patiently stored on it would probably be destroyed, along with the computer itself.

With the increase in the storage capacity of computers and the speed of processing, it has become possible to handle not only flat images, but also three-dimensional objects, such as museum exhibits. This is normally achieved by a technique that involves a combination of both the photographic and laser scanning techniques.

To perform this 3D dimensional scanning, we normally put the object we want to scan on a turntable and then scan it while it is revolving. The product is normally a 3D picture that you can rotate on your screen when viewing it. You can also look at it in 3D with special stereoscopic eyeglasses.

The scanners we use for such operations are classified as small-scale scanners. For the purpose of creating a 3D visualization for large spaces, such as halls, buildings, or ancient temples, we usually use bigger devices classified as medium-scale scanners.

Normally, when such places are scanned, we end up with a *virtual reality* visualization, allowing the user to navigate virtually inside a building, for example, looking inside the different rooms and their contents at his leisure.

Another advanced level of virtual reality is the virtual addition of a missing part to the existing virtual space.

Let us take as an example the Temple of Luxor in Upper Egypt. This temple used to have two obelisks in front of its entrance wall or pylon. During the nineteenth century, one of the obelisks was transferred to the main square in Paris, the Place de la Concorde.

So today, using this *Augmented Virtual Reality* technique, we can show a 3D virtual model of the temple with one of the two obelisks missing. Then we can insert the missing one, which is now in the Place de la Concorde, allowing the viewer to see how it looked when it was still standing in its original place. The result is like looking into the far-distant past.

Heritage: From Folklore to Monuments

Now let us examine a new dimension of the problem, namely, the *thematic dimension of heritage*.

Some years ago, UNESCO divided Heritage into two main categories, Cultural and Natural. The difference between them is that *Cultural Heritage* refers to manmade heritage, while *Natural Heritage* refers, of course, to the heritage we find in the nature around us.

It is vital to preserve both sorts of heritage, which is why UNESCO, along with many governments, organizations, associations, and centers, including the Center for Documentation of Cultural and Natural Heritage in Egypt, is investing a lot of effort in this domain.

To help satisfy his religious needs, man erected temples to show his reverence for the gods. And for shelter, he built houses. Because he also felt the urge to record the diverse shapes and colors that impressed him, he did paintings and sculptures. To express the heavenly rhythms and sounds in the depth of his soul, man composed music.

All of these fall into the category of Cultural Heritage. On the other hand, protectorates, national parks, wild animals, birds, vegetation, all types of biodiversity, natural formations like geological masses, sand dunes, and landscapes are all examples of Natural Heritage.

UNESCO then subdivided Cultural Heritage into two types: Tangible and Intangible, or, as they are sometimes called, Materialistic and Non-Materialistic Heritage.

Tangible Heritage is heritage that we can touch with our hands, including movable objects like the coins, statues, and other treasures we find in museums, as well as immovable objects like ancient tombs, temples, and pyramids, or structures like buildings and bridges or even towns.

For this Tangible Heritage, UNESCO has created a center called the World Heritage Center (WHC). One of the activities of this center is the creation of a World Heritage List (WHL), to which member states have added monuments and sites that are of universal value and interest.

Intangible and *Oral Heritage* is, meanwhile, the heritage that we cannot touch. We can grasp it only through seeing, hearing, smelling, tasting, and feeling. Examples of this are music, folk epics, traditional stories, oral literature, and food.

We must take into consideration the fact that there is a gray, overlapping area between Tangible and Intangible Heritage, especially in the area of folklore. Paintings, for example, are considered intangible, though we can touch them.

Intangible Heritage is in general much more fragile and more vulnerable to loss than Tangible Heritage. That is why the issue of documenting and preserving Intangible Heritage is very delicate and requires special skills in terms of dealing with the ravages of time and fragility.

UNESCO has therefore created a special register for the Oral and Intangible Heritage of Humanity.

UNESCO also has another category: *Documentary Heritage*. This includes archives and books in libraries, as well as collections of manuscripts. *Archival Heritage* is, of course, treated in a different way. Again a special program has been developed by UNESCO especially for that purpose, known as Memory of the World (MOW) program.

Concluding Remarks

During the past few decades, with the introduction of *Information and Communication Technology* (*ICT*), we have started to handle the various categories of heritage in a systematic way, using the different available technologies, such as databases, multimedia, GIS, 3D imaging, virtual reality, and augmented reality.

Now different institutes have started building huge information systems. These days, with systems such as Kindle, IPad, and others, you can download hundreds of books at the click of a button.

Meanwhile, an international project under the title of the World Digital Library, coordinated by the Library of the Congress, is trying to digitize different media such as books, images, sound, videos, maps, and manuscripts from different parts of the world, and linking them together.

Now we can easily imagine gathering the artifacts from a certain historical period, that are scattered in different museums across the world, into one digital system, just as if they were in one museum.

A very good example of this application is the website www.globalegyptianmuseum.org which contains Egyptian artifacts from 13 European museums, in addition to three Egyptian museums. This website is in eight different languages. The reader is also encouraged to visit these websites:

- www.cultnat.org
- www.bibalex.org
- www.eternalegypt.org
- www.egyptmemory.com

As for the field of imaging and cinematography, new technologies are under development that will allow three-dimensional viewing on both the television screen and the silver screen. To start with, viewers will have to use special eyeglasses and then, later, they would not even need glasses at all.

We can imagine the amazing effect that this will have on the photographing and visualizing of different monuments and buildings. A virtual reality application using such technology will be very impressive.

Another thing that we can expect to see in the future is a huge increase in storage capacity that will probably allow us, within a couple of decades, to store everything that humanity has been able to produce throughout the course of its evolution.

Finally, within a few decades, we will probably have every museum, library, archive, and archeological site round the globe digitized and available at our fingertips.

Cultural Heritage in Times of Economic Crisis

Kenneth Aitchison
Landward Research Ltd, Sheffield, UK

State of Knowledge and Current Debates

Applied archaeological practice, as a means of investigating and protecting archaeological sites, landscapes, and material, is a young profession that emerged across the world during the twentieth century. As a practice that has become increasingly linked to land-use change and development expenditure, it has been impacted upon by all of the crises that the global economy has gone through in the twentieth and twenty-first centuries.

The Great Depression of the 1930s led to the first examples of archaeological practice being affected by an economic crisis. In the United States, the recovery plans of President Roosevelt's *New Deal* involved federal investment in capital projects. This included the Tennessee Valley Authority's dam-building program where extensive archaeological excavations were funded ahead of dam construction and subsequent reservoir flooding (Jameson 2004).

Subsequently, since the early 1970s, there have been four international waves of financial crises, and each of these has been followed by recession with impacts on cultural heritage each time. The fourth wave, which began in 2007 and was followed by recession from 2008, was the most severe and the most global since the Great Depression of the 1930s (Kindleberger and Aliber 2011, 1).

Patterson (1999) considers that the emergence of commercial archaeological practice in the United States (as part of cultural resource management) was a consequence of legislative changes that coincided with a transition from Keynesian to monetarist policies in response to the global economic crisis of the 1970s. This crisis followed the enormous costs to the US government of the Vietnam War and the rapid rise in oil prices following the Arab-Israeli War of 1973.

The pre-transformation situation is extensively detailed by Clelow (1973), and from that point on, the commercialization of archaeology in the United States became the norm. This model has been subsequently adopted or adapted in many states around the world, leading to a significant expansion in the scale of archaeological investigation. The political response to the economic situation of the early 1970s shaped how archaeology is undertaken, and this has been the most significant effect of economic crisis upon archaeological practice.

In the United Kingdom, recession at the start of the 1980s led to a lengthy period of mass unemployment. The *Community Programme* of the Manpower Services Commission (MSC), a governmental agency established to introduce unemployment relief measures, funded a very significant number of archaeological projects. These initiatives – like those of the Tennessee Valley Authority 50 years before – aimed to provide work for unemployed individuals and tended to be labor-intensive excavation projects. British archaeology became significantly reliant upon MSC funding, and by 1986–1987, the majority of individuals working in UK applied archaeology were employed on MSC projects (Sheldon 1986).

The UK economy recovered in the late 1980s. The expanding economy led to increasing demand for urban redevelopment, particularly in the City of London. In order to rapidly expedite archaeological work ahead of this construction work, some developers began to directly fund archaeological projects (Spence 1993, 24). At the same time, unemployment was falling and

the MSC program was wound up, leaving a substantial publication backlog as that funding stream had focused on highly visible, labor-intensive excavation. However, during another period of recession in 1990–1991, approximately 300 staff were made redundant by the Museum of London (Young and O'Sullivan 1991).

There were also state programs to reduce unemployment in Germany in the 1970s and 1980s, the most significant of which for archaeology was the ABM (Arbeitsbeschaffungsmaßnahmen); this was continued post-1989 in the Länder of former East Germany. Across central and eastern Europe, the years of transition from 1989 to 1996 (the year in which Poland's GDP surpassed its 1989 level) were marked by significant reductions in the education and culture budgets which had previously funded archaeology (Lozny 2011, 27). Following the transition period, the polluter-pays principle was widely adopted, removing archaeology's reliance on state funding, but in turn exposing archaeological practice to the risks of market engagement.

The Asian Financial Crisis affected east and southeast Asian countries from mid-1997, with the most significant impact on archaeological practice being in Japan, where a system of pre-development archaeological intervention had emerged in response to economic growth, rather than through legislative direction (Okamura and Matsuda 2010).

The Japanese economy had entered an extended period of stagnation 5 years before, leading to the Japanese economy stabilizing into a "lost decade" – subsequently updated to be described as the "lost two decades." The annual number of pre-construction excavations in Japan peaked in 1996, with a decline following the onset of the crisis, but then stabilizing at around 75% of the 1996 level from 2000 onward (Ikawa-Smith 2011, 696; Okamura 2011, 78). There was a decline in the number of individual archaeologists working in Japanese archaeology but this was not dramatic – between 2000 and 2013, the workforce shrank by 17% (less than 1.5% per annum (Zorzin 2013, 9)). Economic stagnation reduced worker mobility (90% of Japanese archaeologists work for local government or semi-public foundations (Okamura 2011, 77)) and reduced opportunities for new entrants – only 3% of "field" archaeologists were aged in their 20s in 2008 (*ibid*, 85). As stagnation continued after 2008, while governmental archaeological services appeared to remain secure, some private companies began to enter the market and a trend toward this model was being recognized by practitioners (Zorzin 2013, 16).

Before 1991, archaeology in the USSR featured "the world's largest network of archaeological research" (Dolukhanov 1993, 150), with wide-ranging organizations and state funding – but following the end of the Soviet Union in 1991, "... the deep economic crisis combined with the painful transition to the market economy has resulted in considerable reduction in the funding of fundamental sciences and particularly of the humanities" (ibid.). In a situation where the collapsed system was left in a chaotic financial state, archaeology had to rapidly adapt to the realities of the market economy, with the first private sponsorship of excavation in Russia taking place in 1992.

A subsequent economic crisis in Russia in 1998 had little immediate impact upon archaeology, but 2 years later the effects of recession on the building industry then led to a significant reduction in the amount of archaeological work being undertaken (Engovatova 2010, 100). Recovery was again threatened by the effects of the global crisis from 2008, but investment in infrastructure projects protected the sector from immediate effects (Kradin 2011, 248; Engovatova 2010, 101–102).

The scale of the global financial crisis of 2008 and subsequent investment to stimulate recovery by national governments was vastly greater than any of the previous crises. John Lanchester suggests that it cost the US taxpayer $7.76trn, more "than the cost of the Marshall Plan, the Louisiana Purchase, the 1980s savings and loans crisis, the Korean war, the New Deal, the invasion of Iraq, the Vietnam war and the total cost of NASA including the moon landings, all added together [and adjusted upwards for inflation]" (Lanchester 2010).

The impact on archaeological practice was considerable. Different approaches to market

engagement were central to the visibility of the effects of the economic crisis on archaeological practice in different countries around the world, and the impact was most immediately visible where archaeology was most commercialized and relying primarily on private sources of funding (Aitchison 2009b).

Altschul and Patterson (2010) estimated that approximately 11,350 people worked as professional archaeologists in the United States in 2008, with spending on cultural resource management between US$600 m and $1bn at that time, which was just as the crisis was beginning to break. While US federal expenditure on archaeology remained roughly constant in the short term through the indirect benefits of federal economic stimulus legislation (*The American Reinvestment and Recovery Act* (ARRA) was signed into law by President Obama in February 2009), private sector spending on cultural resource management dropped significantly in 2009 and ARRA funding was slow to come on stream (Altschul 2010, 104–105).

Archaeological work in the United Kingdom is largely commercialized and very closely linked to land use change and property development, with 93% of all archaeological projects in 2007 being initiated through the land-use planning system (Aitchison 2009a). The volume of housebuilding began to decline from 2007 and effectively halted in the autumn of 2008, with applied archaeology being seriously and rapidly affected (10% of all jobs in archaeology were lost in the 6 months to April 2009, and spending by developers on archaeology fell by 12% between 2007–2008 and 2009–2010 (Aitchison 2010, 26)).

State funding for national and local government archaeological agencies in the United Kingdom then fell considerably from 2010, with numerous individual archaeological advisers losing their jobs and the effective levels of protection for archaeological sites and landscapes being reduced (Aitchison 2011).

In Ireland, the effects of the economic crisis were even more extreme. Irish archaeology grew at a remarkable rate in the early twenty-first century, funded by infrastructure projects that were accessing European Union support and by a private housing boom. The numbers of individual archaeologists in employment increased by 263% between 2002 and 2007, from 650 to 1709 (McDermott and La Piscopia 2008, 5). When the crisis led to the end of the building boom, "between July 2008 and January 2009 there was a 52% reduction in the total number of archaeological staff employed in Ireland … an 82% reduction in contract [commercial] archaeologists employed in the same period" (Eogan and Sullivan 2009). By early 2011 it was estimated that only 350 people were still working in the sector (Heritage Council 2011).

All across Europe, public debt before 2007–2008 was often high, and one of the direct effects of the crisis was a steep deterioration in government finances and an increase in government debt. Countries that were particularly exposed to this were forced into cutting spending and implementing austerity budgets. The effects of this were most significant in Greece, where the recession lasted from 2009–2017 (Pagoulatos 2017). Almost all archaeological work and site management in Greece was financially dependent upon the state and sweeping budget cuts impacted on both staff numbers and the public accessibility of archaeological sites and museums (Howery 2013) – and there was also a significant rise in site looting and artefact trafficking (ibid.).

In the developing world, the threats to cultural heritage are a different order of magnitude entirely. The relative poverty of countries that are essentially in perpetual economic crises makes the consequences of underinvestment in the management of cultural heritage significant, in terms of how heritage – monumental, portable, and intangible – is, or is not, protected.

Commercial archaeology has been described as an economic canary (Schlanger 2010), vulnerable to rapid changes and one of the first sectors to suffer the impacts of economic crisis. Because archaeology has received funding in times of crisis from capital expenditure programs (and unemployment reduction initiatives), some mistakenly believe that crises have a positive effect on archaeology (such arguments are presented by Merrony and Eisenburg (2009) and are critiqued by Altschul (2010, 104)). The amounts spent on

archaeological practice through these measures in the years following 2008 were insignificant when compared with the sums that were being invested by developers and other funders pre-crisis.

All of the crises discussed here have had significant and long-lasting effects on the delivery of archaeological practice and upon the careers and livelihoods of individual archaeologists, and thus upon the protection of the material remains of the human past.

In the United States in the 1970s and in the United Kingdom in the 1980s, economic crises led to the structural reorganization of archaeology following the models of "neoliberalism or late capitalism" (Zorzin 2013, 5). The global political changes that followed the economic crisis of 2007–2008 have been a rise in populism and nativism. These have not yet led to structural changes in the global economic order, and as yet no transformations comparable to the anglophone experiences of the 1970s and 1980s have changed the way that cultural heritage management is undertaken.

Cultural Heritage Interpretation

John H. Jameson
12,000 Year History Park, Cayce, SC, USA
International Committee on Interpretation and Presentation of Cultural Heritage Sites (ICIP), ICOMOS, Savannah, GA, USA
International Scientific Committee on Archaeological Heritage Management (ICAHM), ICOMOS, Washington, DC, USA

I can only note that the past is beautiful because one never realises an emotion at the time. It expands later, and thus we don't have complete emotions about the present, only about the past. – Virginia Woolf

Philosophical Background

Interpretation and the Conservation Movement

By the last half of the nineteenth century, the conservation movement had taken hold among natural resource advocates and influential politicians in the United States such as Theodore Roosevelt. The movement emphasized sustainable use of natural resources and preservation of wilderness areas. Conservation efforts aimed to preserve natural resources expressly for their continued sustainable use by humans. Conservation for its own sake became a popular theme for influential thinkers such as John Muir. Muir, the inspirational nineteenth-century conservationist, is often credited with establishing the basis for modern-day institutional standards for interpretation. Among many attributes, Muir believed that "the power of imagination makes us infinite," and "Government protection should be thrown around every wild grove and forest on the mountains . . . " (Wolfe 1979).

After Muir, another prominent American, Enos Mills, led "wilderness walks" and helped urban dwellers connect with the countryside. Mill's lobbying efforts were pivotal in establishing Rocky Mountain National Park in 1915.

Freeman Tilden and Developments in the Twentieth Century

By the early twentieth century, the US National Park Service recognized the value in programs which encouraged people to both respect their surroundings and support public stewardship in the parks. In 1957, this approach was set down on paper by Freeman Tilden in his *Interpreting Our Heritage*. His six principles have defined heritage interpretation for over half a century. Tilden, in his seminal 1957 book (Tilden 1957, 1977), laid out six principles of interpretation:

1. Interpretation that does not somehow relate what is being displayed or described to something within the personality or experience of the visitor will be sterile. Interpretation should be personal to the audience.

2. Information, as such, is not interpretation. Interpretation is revelation based upon information. Successful interpretation must do more than present facts.
3. Interpretation is an art, which combines many arts. Any art is in some degree teachable.
4. The chief aim of interpretation is not instruction but provocation. Interpretation should stimulate people into a form of action.
5. Interpretation should aim to present a whole rather than a part. Interpretation is conceptual and should explain the relationships between things.
6. Interpretation addressed to children should not be a dilution of the presentation to adults but should follow a fundamentally different approach. Different age groups have different needs and require different interpretive programs.

To Tilden, heritage interpretation "is an educational activity which aims to reveal meanings and relationships through the use of original objects, by firsthand experience, and by illustrative media, rather than simply to communicate factual information" (Tilden 1957).

Tilden's principles have remained highly relevant to interpreters worldwide, although elaborations on the principles have been suggested by Beck and Cable (2002, 2011) and others. With Tilden's principles as a basis, leading organizations have adopted similar elaborations:

- *Interpretation facilitates a connection between the interests of the visitor and the significance and relevance of the park.*
- *The primary goal is not to provide information, but to provide access to these meanings.*
- *The interpreter must be able to subjugate his or her own passions for, and understandings of, the resource in order to allow the audience to form theirs.*

— U.S. National Park Service (2007)

Interpretation is a mission-based communication process that forges emotional and intellectual connections between the interests of the audience and the meanings inherent in the resource.

— The National Association for Interpretation (NAI n.d.)

[Interpretation is] …. any communication process designed to reveal meanings and relationships of cultural and natural heritage to the public, through first-hand involvement with an object, artifact, landscape or site.

— Interpretation Canada (https://interpretation canada.wildapricot.org/page-18058)

Interpretation enriches our lives through engaging emotions, enhancing experiences and deepening understanding of people, places, events and objects from past and present.

— The Association for Heritage Interpretation (https://ahi.org.uk/)

*Interpretation refers to the full range of potential activities intended to heighten public awareness and enhance understanding of [a] cultural heritage site [*sic*]. These can include print and electronic publications, public lectures, on-site and directly related off-site installations, educational programs, community activities, and ongoing research, training, and evaluation of the interpretation process itself.*

— ICOMOS Ename Charter for the Interpretation and Presentation of Cultural Heritage Sites (2008)

[Interpretation is] …. all the ways of presenting the cultural significance of a place.

— Australia ICOMOS (2013)

Evolving Philosophies of Interpretation

With conceptual roots going back to the first half of the twentieth century, the public interpretation and presentation of cultural and archaeological heritage has become an essential component in the conservation and protection of cultural heritage values and sites. Beginning in the 1930s with the Athens Charter of 1933 (Munford 2000: 73–91) and accelerating as the expanding concepts of heritage and heritage conservation progressed in subsequent decades, an evolving list of international documents, conventions, and charters has led to more recent discussions and debates about resource significance. Concerns for relevancy, community engagement, and inclusion led to calls for the promulgation of principles and guidelines for interpretation and presentation.

By the latter part of the twentieth century, cultural heritage specialists were beginning to address the contemporary context of their research as part of a growing practical and ethical awareness. Inspired by visionaries such as Tilden, interpretation practitioners increasingly rejected programs and presentations that did not attempt to go beyond a recitation of facts. Only programs that facilitated and provoked emotional and intellectual connections of the audience to meanings inherent in the resource were deemed acceptable.

In recent years, the public interpretation of archaeological and cultural heritage sites has come to be recognized as an essential component within management schemes surrounding the conservation and protection of cultural heritage sites and resources worldwide (Jameson 1997, 2004b, 2007, 2013, 2016, 2019).

Leading Global Initiatives

As mentioned, standards development for cultural heritage public interpretation gained momentum with initiatives in the 1990s by the US National Park Service (NPS) and the National Association for Interpretation (NAI). NPS, through its Interpretive Development Program (IDP), promulgated a multifaceted, delivery mode-specific, employee training program (Jameson 1997, 2007), and in the year 2000, NPS finalized the archaeology/interpretation shared competency Module 440 "Effective Interpretation of Archeological Resources" Study Guide (Jameson 2007; DeCunzo and Jameson 2005). On site, interdisciplinary workshops based on the module were conducted at multiple national parks and international sites between 2004 and 2018. Also stemming from the model are two online courses, "Archaeology for Interpreters" and "Interpretation for Archaeologists" (NPS 2019). NAI, a non-governmental and nonprofit, independent organization, provides many training and certification opportunities and is a major advocacy group for standards development among both government and non-government organizations and agencies (NAI n.d.). The European counterpart to these organizations is Interpret Europe. Headquartered in Freiburg, Germany, Interpret Europe acts as a European platform for interpretation cooperation and exchange, especially on research and education. Interpret Europe has issued several recent guidelines for interpretation on topics such as migrant inclusion in schools and adult learning (Interpret Europe 2019).

Prelude to an International Charter

Beginning with the 1931 Athens Charter for the Restoration of Historic Monuments, through the 1964 Venice Charter, and continuing with the adoption of the 2003 ICOMOS Charter for the Analysis, Conservation and Structural Restoration of Architectural Heritage, the international heritage community has produced and ratified a long line of doctrinal texts setting out standards for best practices in the conservation and maintenance of cultural resources all over the world. Still, there remained a gap in the international consensus. By 2006, while most existing cultural heritage charters and documents dealt primarily with issues of physical conservation and site management, none specifically addressed the principles of effective communication of the significance of cultural heritage sites. Although interpretation was recognized as an abstract and subjective concept, when compared to the tangible conservation challenges of frescoes, mosaics, stonework, and earthen architecture, it was also seen as giving life to the ideas and images that determine how people relate to the material remains that surround them (Silberman 2006).

Another recognized urgency was the need for the development of interpretation methods and technologies that helped stimulate local economic development through paid admissions, souvenir sales, employment opportunities, and a steady flow of tourist revenue for hotels, shops, and restaurants in the local community. The transformation of cultural heritage sites into venues for tourism and leisure-time entertainment was seen as posing great dangers for the cause of conservation in the long run. If the right balance is not achieved between the contribution of outside scholars, exhibit designers, and heritage professionals and the local community, the site development project, even if financially successful, could appear to local residents as an outside imposition –

like a shopping mall or private theme park – with solely or mainly economic significance for the community. It can also sow resentment among those not immediately benefiting from the gains and who often suffer from the successful site's side effects – a lack of parking, traffic congestion, and disruption of normal routines. It can thus be dismissed as "someone else's" monument, an alien intrusion not meaningfully integrated into the memories, stories, and attitudes that constitute the entire community's shared identity (Silberman 2006).

These concerns about interpretation plans and methods served as the impetus for the formulation of a charter that might achieve international consensus about the intellectual, ethical, social, and economic contexts in which heritage interpretation might be most effectively and constructively carried out. In the spring of 2002, an initial draft was formulated by the staff of the Ename Center, based on close consultation with a range of international colleagues and following the model of earlier charters in the cultural heritage field. This first draft was circulated widely during the summer of 2002 in anticipation of the Ghent Conference on Heritage, Technology and Local Development later that year (Silberman 2006).

The effects of dramatic increases in heritage tourism have stirred a dramatic expansion of interpretive activities at cultural heritage parks and sites. Agencies and institutions in Australia, North America, and Europe have promulgated standards and policies that are aimed at facilitating social, conservation, and stewardship principles. The expansion of interpretive activities, coupled with the introduction of elaborate interpretive technologies in emerging economic contexts, has created new challenges for interdisciplinary collaboration among public archaeology and interpretation professional communities as they attempt to formulate workable approaches at local and community levels.

US/ICOMOS 2005 Charleston Declaration on Heritage Interpretation

On the occasion of the 8th International Symposium of US/ICOMOS, "HERITAGE INTERPRETATION, Expressing Heritage Sites Values to Foster Conservation, Promote Community Development, and Educate the Public," approximately 200 delegates from all over the United States, more than a dozen nations and several disciplines met in Charleston, South Carolina, in May 2005 to share experience, draw lessons and address issues surrounding the public interpretation of cultural heritage sites. The Declaration sought to establish an international consensus on the scientific, ethical, and educational principles for the public presentation and interpretation of cultural heritage. The symposium benefited from continuing scholarly and professional discussion of the methods and philosophy of heritage interpretation in many regions of the world and the ongoing review and revision process of the ICOMOS Ename Charter on the Interpretation of Cultural Heritage sites, drafted under the scientific auspices of ICOMOS and sponsored by the government of the Province of East Flanders and the Flemish Community of Belgium.

The Council of Europe's Faro Convention of 2005

The protection of cultural heritage and the definition of its value to society were the focus of the Faro Convention that was adopted by the Council of Europe in 2005. The Convention addressed the innovative concept of the "common heritage of Europe" and its relationship to human rights and fundamental freedoms. The right to cultural heritage defined by the Faro Convention was expressed as a dimension of the right to participate in the cultural life of the community, as well as the right to education and to be informed. Together with other international human rights documents, such as the *Universal Declaration of Human Rights* or the International Covenant on Economic, Social and Cultural Rights, the Convention addressed individual rights and the organization of public responsibilities for cultural heritage or access to cultural heritage and democratic participation. This was complemented by Interpret Europe's Freiburg Declaration that emphasized how stakeholders can contribute to the development of the interpretive profession (Interpret Europe 2019).

The ICOMOS Ename Charter on the Interpretation and Presentation of Cultural Heritage Sites (2008) (ICOMOS Charter)

The Ename Charter Initiative

Probably the most important international document guideline to date relating to interpretation and presentation of cultural heritage sites is the ICOMOS Ename Charter on the Interpretation and Presentation of Cultural Heritage Sites (2008). The Charter lays out seven principles of interpretation and presentation about the conservation, education, and stewardship messages that represent the transcendent humanistic values of the resource. These principles provide an outline of professional and ethical standards, placing emphasis on the essential roles of public communication and education in heritage preservation. ICOMOS International Committee on Interpretation and Presentation of Cultural Heritage Sites (ICIP), formed in 2006, in addition to promoting the development, adoption, and application of the Charter principles, sponsors conferences and events designed to foster the formulation of best practices in interpretation and presentation within prescribed cultural and political settings.

The ICOMOS Charter is an important instrument for intercultural dialogue. Like the Council of Europe's European Landscape Convention in the year 2000 and the Faro Declaration on the Council of Europe's Strategy for Developing Intercultural Dialogue of 2005, the ICOMOS Charter is a modern-style "enabling" instrument in that it suggests and facilitates ways forward that depend on democratic consensus and interdisciplinary cooperation; it is not a top-down prescriptive directive in the tradition of earlier twentieth-century heritage paradigms. It regards heritage as a contemporary issue – a resource for social and economic development, for the enhancement of cultural diversity and the promotion of intercultural dialogues and as part of an economic development model based on the principles of sustainable resource use. In response to increased economic and political pressures from the tourism industry, coupled with an enhanced public interface, the standards for interpretation of heritage sites have become important topics for international discussion and debate.

The Ename Charter Principles

The Ename Charter on Interpretation is internationally significant in the history of heritage management in that it addresses the purpose and principles of public interpretation, arguably the most important activity that occurs at a historic site, by delivering the conservation, education, and stewardship messages that represent the transcendent humanistic values of the resource. The principles place emphasis on the essential roles of public communication and education in heritage preservation and are presented under the following basic headings: Access and Understanding, Information Sources, Context and Setting, Authenticity, Sustainability, Inclusiveness, and Research, Education, and Training. On the surface, the principles are generally commonsensical in terms of conditions and prescriptions for effective public interpretation. Just how the principles are articulated, however, determines how well they are received in international circles and whether they will be considered desirable, practical, and feasible. In countries with fragile or questionable human rights histories or poorly developed infrastructure, practical applications are problematic.

Adoption by ICOMOS

International dialogue and reaction spurred by the Ename Charter initiative led ICOMOS to expand global discussions using the Ename Charter as a stimulus to guide and inform the process. In early May 2005, in recognition of high public interest and the effects of mass tourism, the connections to current heritage management practices, and technological advancements, US/ICOMOS held a conference in Charleston, South Carolina, to better articulate a consensus on internationally applicable public interpretation principles. The main outcome of the conference was the Charleston Declaration on Heritage Interpretation, issued on May 7, 2005, which reiterated the importance and purpose of establishing a set of internationally relevant principles for interpretation. The declaration pointed out that additional clarifications were needed before the final adoption of a doctrinal document on interpretation at the ICOMOS General Assembly in Quebec in 2008 (Silberman 2006, 2009).

Interpretation and the Concept of Authenticity

The concept of authenticity has become a central concern in the conservation and interpretation of cultural heritage. The Nara Document of 1994 (ICOMOS 1994) built on the Venice Charter (ICOMOS 1965) considering an expanding scope of cultural heritage concerns. It addresses the need for a broader understanding of cultural diversity and cultural heritage and underscores the importance of considering the cultural and social values of all societies. It emphasizes respect for other cultures, other values, and the tangible and intangible expressions that form part of the heritage of every culture. There are no fixed criteria to judge value and authenticity of cultural property; rather it must be evaluated within the cultural context to which it belongs. Though responsibility for the care and management of heritage belongs primarily to the culture that produced it, the document calls for adherence to the principles and responsibilities imposed by international charters.

At Chaco Canyon in the mid-1990s, Christine Finn (1997) examined the quandary of US National Park Service employees in dealing with ritual objects left at Casa Rinconada. In her essay, she raises the issue of "authentic" use of an ancient site and asks whether it is possible to discriminate one use as more worthy than another. The Native American community argued their right through inheritance or continued use: How might more recent visitors, such as twenty-first century New Age followers, claim their right to use the site? Is their use, for ritual purposes, an expression of care and understanding, or does it mark a lack of consideration for earlier claims on the site? Is the site, or the significance of the encompassing landscape, the main issue? Chaco Canyon, she points out, as a celebrated heritage complex located in the American Southwest desert, continues to be a valuable resource to Native Americans while also becoming a ceremonial center for New Age followers, who were, ironically, in part inspired by Native American knowledge.

As this case exemplifies, and as was reflected in the conclusions of the Charleston Declaration and as listed as a core principle in the ICOMOS Ename Charter of 2008, further discussions are needed on the concept and meaning of "authenticity" in interpretation. Traditional attitudes that focus on static, material authenticity will need to be replaced with more conditional and contextual definitions shaped by acknowledgment of dynamic processes of cultural change and diversity rather than judgments based on fixed criteria. Definitions of authenticity should be tempered or guided by local and community-based, inclusive analyses. Any analysis model for authenticity should reflect and represent multiple perspectives on what is authentic or "true" about a site or place and should provide a roadmap for practical solutions. The nature and qualifications of "experts" on authenticity should reflect the diversity of cultural affiliations and values attributed to the site, which, in turn, should be periodically reviewed and reassessed.

Nara +20

Building on international conventions and charters and the work done by academics and professionals since the drafting of the Nara Document, we can expand the scope of cultural heritage and underscore the importance of cultural context and cultural diversity. The Agency for Cultural Affairs (Government of Japan), in celebrating the 20th anniversary of the Nara Document, initiated a series of meetings of experts in cooperation with Kyushu University to evaluate and learn from the practical experiences of applying the Nara Document to the identification and management of heritage sites over the last 20 years (Silberman n.d.). This Nara +20 text (adapted from Silberman n.d.), building on the Himeji Recommendation, identified five key interrelated issues highlighting prioritized actions to be developed and expanded within global, national, and local contexts by wider community and stakeholder involvement:

1. *Diversity of heritage processes*. Just as the Nara Document indicates that authenticity varies according to the cultural context, the concept of cultural heritage itself assumes diverse forms and processes. In the last 20 years, heritage management and conservation practices have increasingly taken into

consideration the social processes by which cultural heritage is produced, used, interpreted, and safeguarded. In addition, social processes and perceptions of authenticity have been affected by emerging modes and technologies for accessing and experiencing heritage. Further work is needed on methodologies for assessing this broader spectrum of cultural forms and processes and the dynamic interrelationship between tangible and intangible heritage.

2. *Implications of the evolution of cultural values.* The Nara Document acknowledges that cultural heritage undergoes a continuous process of evolution. In the last 20 years, recognition of this evolution has created challenges for heritage management and has led practitioners to question the validity of universal conservation principles. In addition, during this period, fruitful engagement by communities in heritage processes has given rise to the acceptance of new values that had previously gone unrecognized. These changes require that the identification of values and the determination of authenticity be based on periodic reviews that accommodate changes over time in perceptions and attitudes, rather than on a single assessment. A better understanding is needed of the processes by which authenticity can be periodically assessed.
3. *Involvement of multiple stakeholders.* The Nara Document assigns responsibility for cultural heritage to specific communities that generated or cared for it. The experience of the last 20 years has demonstrated that cultural heritage may be significant in different ways to a broader range of communities and interest groups that now include virtual global communities that did not exist in 1994. This situation is further complicated by the recognition that individuals can be simultaneously members of more than one community and by the imbalance of power among stakeholders, often determined by heritage legislation, decision-making mechanisms, and economic interests. Those with authority to establish or recognize the significance, value, authenticity, treatment, and use of heritage resources have the responsibility to involve all stakeholders in these processes, not forgetting those communities with little or no voice. Heritage professionals should engage in community matters that may affect heritage. Further work is needed on methodologies to identify the rights, responsibilities, representatives, and levels of involvement of communities.
4. *Conflicting claims and interpretations.* The Nara Document calls for respect of cultural diversity in cases where cultural values appear to be in conflict. In the last 20 years, it has become evident that competing values and meanings of heritage may lead to seemingly irreconcilable conflicts. To address such situations, credible and transparent processes are required to mediate heritage disputes. These processes would require that communities in conflict agree to participate in the conservation of the heritage, even when a shared understanding of its significance is unattainable. Further work is needed on consensus-building methods to heritage practice.
5. *Role of cultural heritage in sustainable development.* The Nara Document does not specifically address issues of culture and development. Over the last 20 years, however, the need for considering cultural heritage in sustainable development and poverty reduction strategies has gained broad acceptance. The use of cultural heritage in development strategies must take into account cultural values, processes, community concerns, and administrative practices while ensuring equitable participation in socioeconomic benefits. The trade-offs between conservation of cultural heritage and economic development must be seen as part of the notion of sustainability. Further work is required to explore the role that cultural heritage can play in sustainable development and to identify methods of assessing trade-offs and building synergies so that cultural values and community concerns are integrated in development processes.

Despite years of expert discussion, the concept of "authenticity" continues to be elusive. Additional research and discussion are needed to define its nature and role in heritage interpretation.

The Challenges of Today and the Future

Recognizing Key Concepts in Interpretation: Multiculturalism, Inclusiveness, and Community Engagement

In present-day discussions and debates about interpretation standards, as with "authenticity," the subject of inclusiveness tends to be one of the more contentious and problematic issues. There are many, often overlapping, roadblocks to inclusiveness involving cultural, political, economic, and social factors. It can seem hopeless in a wide variety of sites and settings: Can Jerusalem, for example, ever be interpreted in a way that we can describe as inclusive to all, or even a majority, of stakeholders?

Multiculturalism is a view, or policy, that immigrants and other groups should preserve their cultures with the different cultures interacting peacefully within one nation. It is one of those terms that are difficult to describe definitively, but it is a key concept in heritage studies because it describes the general sociopolitical environment that is necessary for public policy in managing cultural diversity in multiethnic societies, stressing mutual respect and tolerance for cultural differences within a country's or region's borders. As a policy, multiculturalism emphasizes the unique characteristics of different cultures, especially as they relate to one another within national boundaries. This has been the official policy of Australia, Canada, and the United Kingdom. Multiculturalism has been described as preserving a "cultural mosaic" of separate ethnic groups and is contrasted to a "melting pot" that mixes them, the United States commonly being given as an example of a melting pot. Some use the term multiculturalism differently, describing both the melting pot and the "cultural mosaic" condition, such as in Canada, as being multicultural and referring to "pluralistic" vs. "particularist" multiculturalism. Pluralistic multiculturalism, like the melting pot concept, views each culture or subculture in a society as contributing unique and valuable cultural aspects to the whole culture. Particularist multiculturalism is more concerned with preserving the distinctions between cultures. Probably no country falls completely into one, or another, of these categories.

When we contemplate the challenges posed by the study and commemoration of heritage places within modern multicultural societies, we step into a complicated maze of terminology and semantics centered on international debates about relevance and conscience as well as cross-cultural and international priority and appropriateness. The nature of the reality of multiculturalism in any one country or region affects public policies and attitudes about inclusive heritage interpretation and where to focus the discussions: that is, what are the messages, and to whom are the messages directed?

We come to the table with developing, and sometimes divergent, assumptions and purposes for site commemoration and treatment. While no country or region in the world practices or exhibits multiculturalism in the same manner, most of the these conversations occur in countries from the Western cultural tradition, or, at least, the terminology used in these discussions stems from the predominately Western ideas of equal treatment, ethnic sensitivity, and accountability for multiple points of view that are constantly and openly debated. Many of the categories used in heritage site management, such as national park, national monument, and world heritage site, are notions of commemoration originating in the West. We should remind ourselves that, as we enter discussions of international and universal relevance, we need to be cautious in avoiding terminology that can appear, to a non-Westerner, to be patronizing and insensitive. Notably, the concept of "multiculturalism" has been described as "no longer tenable" by nondemocratic leaning political leaders (BBC News 2019). Multiculturalism may be rejected altogether as invalid or undesirable by some cultures and countries, making the preconditions for inclusive heritage interpretation more challenging.

Developing Community-Engaged Relationships in Interpretation

Heritage studies are increasingly engaged in publicly interactive research involving interpretation programs that are a collaboration between

archaeologists and other heritage specialists and the lay public. During the last two decades, globalization forces created a need for contextualizing knowledge in order to address complex issues and collaboration across and beyond academic disciplines, using more integrated methodologies that include the participation of nonacademics and increased stakeholder involvement. Successful programs empower (or share power), as well as motivate, lay persons to more active involvement in not only archaeological fieldwork but also interpretation and dissemination processes. The resulting collaborative relationships generate "multivocality" within a participatory culture model. In these cases, participatory approaches often apply public/professional mediation within established principles of public presentation and interpretation. At times, this complements the academic perceptions of the past, but in others it challenges or replaces them. Cultural heritage specialists should embrace these collaborative opportunities that ultimately strengthen public support and appreciation of archaeology and cultural heritage (Jameson and Eogan 2013; Jameson 2013).

The relationship between community participation and interpretation of the sites is an important topic for current and future research. We are only beginning to evaluate our results and experiences. In these endeavors, we need to work with our social science colleagues in such fields as sociology and social psychology in developing methodologies (surveys, focus groups, interviews, ethnographic observations, etc.) that can be applied to studies of cultural and archaeological heritage. We need to complement these studies with innovative ways to identify, and receive input from, stakeholders. We need to develop marketing and social media skills. We need also to work with our communication partners such as interpreters, guides, exhibit designers, and site managers in developing collaborative relationships.

Those of us who strive to work in community-engaged environments often carry out our deliberations and reflections in the context of a juncture of cultural heritage and community values. Those of us in resource management positions seek to empower, and share power, with diverse communities of defined stakeholders interacting in a variety of social contexts. In our interactions with and within communities, however they are defined, we need to recognize that our work is always going to be an intervention into an existing social context where people are already actively producing and negotiating identities and where the past is plural and contested. Community archaeology may well contribute to social cohesion, i.e., using fieldwork to counter a spike in crime and disorder in school-aged populations, but "we should also recognize that outcomes are not invariably positive and beneficial; once archaeologists engage with the heritage process they are engaging with the politics of recognition. And recognition and inclusion must, by definition, also differentiate and exclude" (Smith 2012; Nevell and Redhead 2015).

We should also recognize that there may be a complex play between individual motivations and benefits and any sense of community. Participation in projects may primarily be to augment the school curriculum or as parts of therapeutic practices. Recognizing the importance of individual motivation has led to new and significant forms of evaluation, pioneered by the Dig Greater Manchester project in the United Kingdom that found that "volunteers and participants usually have more personal reasons for engaging with community projects: to gain confidence, for the enjoyment of working with others, and for the empowerment that comes from giving the present more meaning. Simply by taking part in the process and engaging in these activities, individuals can acquire new life skills while some of our larger academic questions are being addressed".

We know that funding is always a challenge, both because resources are increasingly scarce and because funding schemes can impose their own rules and conditions, which, in themselves, make the relationships between communities and professional heritage studies practice more complicated. We have seen the reduction of major funding sources, such as the National Science Foundation in the United States and the National Lottery Heritage Fund in the United

Kingdom, and a draining away of support from universities, exacerbating the problem.

Advancement of Community Activism and Collaboration

Today, application of a participatory culture model and cultural specialist/lay person collaborative relationships are central components of effective interpretation of cultural heritage sites. An active role by the community in the interpretation of material culture is an essential ingredient that gives non-archaeologists power to interpret the past. Practice shows that people can ascribe new relationships with sites, with technical or scientific interpretation being just one of the many variations of meaning.

The attainment of effective and sustainable outcomes is unlikely if heritage professionals plan interventions without consulting stakeholder groups or believe they are the experts in a field and think that they know what is best for the community. In simple terms, community engagement in heritage practice involves ongoing consultation and support to develop the community's confidence, skills, and resources to identify, prioritize, organize, and collectively solve its heritage-related problems and issues.

Authorized Discourses, Elitism, and the Politics of Power

In most countries, the authorized heritage discourse (AHD) has dominated interpretation at managed sites reflecting an elitist narrative, displaying and requiring technical knowledge and insight to be comprehended. In many cases, the interpretation is very classical with a romantic vision and little or no conservation, highlighting the aesthetic, monumental, and "spectacular" aspects of sites at the expense of other significant features. Laurajane Smith (2012) has examined the consequences of this discourse for heritage study practices associated with community engagement and outreach. Smith maintains that the AHD frames archaeology heritage practices and works to conceive heritage as specifically "archaeological heritage." The archaeological discipline owes much to the existence of this discourse, which privileges expert values over those of community and other subnational interests and which works to constrain understandings of heritage as primarily material, neglecting intangible values. The political dominance of this discourse has hindered productive and critical community engagement, rendering it essentially a top-down interaction. This is particularly the case in cultural resource management (CRM) and cultural heritage management (CHM) situations where the government or regulatory authority is dominant. However, as they partake in decision-making schemes and processes worldwide, archaeologists are increasingly engaged in self-conscious and explicit challenges to this discourse to facilitate meaningful community partnerships (Jameson 2016).

Ideally, these community partnerships and conversations between two or more groups of people are democratic in considering all perspectives. But this is not the reality. Too often, these communications are "silently" dictated by those with authority. In cases of heritage management, it is the archaeologists and heritage authorities with meaningful power. For example, within the South African context, the perspectives of communities are considered against unrepresentative legal mandates that do not consider their ritual beliefs meaningfully. In these situations, a truly democratic approach to heritage management, framed within a framework of community empowerment, is difficult, if not impossible, to attain (Ndlov 2019).

Pedro Funari and colleagues in Brazil (Funari et al. 2016; Funari and Alfonso 2019) have dealt with the question of using material culture (artifacts) to change perceptions of people and empower them. They present a case of African-Brazilian community participation in Southern Brazil, discussing how heritage issues can be a catalyst for empowerment and social diversity. Their work illustrates the importance of collaboration between universities and communities and shows how, through community-based participatory research and the use of museum material, participative principles can guide the construction of more pluralist interpretive narratives, embracing issues associated with memory, exclusion, and empowerment.

Knowledge-Making and New Narratives

Coburn and Stein (2006) have described the promise of local knowledge for a new generation of scholars that seek a connection rather than domination or mastery over their subjects/objects of interest. The focus is on a situated knowledge-making practice that includes, on equal footing, expert and local knowledge-makers. In this context, "knowledge-making" is a transformative connection between the people and the outcomes of collaboration, research, and action.

Proponents of community-based participatory research advocate for the active involvement and engagement of community members, citing improved construct validity, intervention efficiency, and accountability (Montoya 2017; Montoya and Kent 2011).

In some interdisciplinary collaborations, a new creative space emerges, created beyond the realms of all the participants' disciplinary and bureaucratic silos. The resulting entirely new community space is possible only through nonspecialist participation in the planning and carrying out of the research project's design and the sharing of archaeological knowledge through engagement with "others" (Jeppson et al. 2019).

In several parts of the world, indigenous populations have adopted the works of tourist art to create new interpretive narratives that imply a transformation in the appreciation and revaluation of indigenous cultural heritage sites. In the case of the Maya architecture in Chichén Itzá, the rebuilding of a new pyramid emphasizes the importance of the physical site to the ancient Chichén Itzá community, helping to demonstrate the need for continued preservation, allowing for acknowledgment of the past while moving toward the future. Here, commercialization and tourism have generated a new way to visit the distant past, where the spectacle of restoration catches the visitor's eye through illuminating the pyramid at night. The economic power of tourism dominates the scene. Modern Maya people accept this homily and have made it part of their culture today (Barry 2014, 2016). Conversely, in the American Southwest, traditional decorative design elements of pottery collected by nineteenth-century archaeologists have inspired modern indigenous potters to replicate the designs in the production of tourist art, resulting in a rediscovery of an important aspect of their traditional culture as well as an appreciation of the economic power of tourism (Jameson et al. 2003).

Facilitated Dialogue and Civic Engagement

The traditional approach in public interpretation defines interpretation as a communication process that facilitates emotional and intellectual connections between the interests of the audience and the meanings inherent to the resource. Effective programs have designs and content that is appropriate for the audience and provides clear focus for these connections by demonstrating the cohesive development of a relevant idea or ideas rather than relying primarily on a recital of a chronological narrative or series of facts or lists.

Today, one measure of success in the practice of heritage interpretation is a robust degree of community engagement. Many of these projects and programs emphasize substantial efforts in professional/community collaboration and power sharing. Cultural heritage interpretation, as an expression of certain cultures, can be an important mediator between pasts and futures. New philosophical/methodological trends in public interpretation are reshaping the messages delivered at archaeological and cultural heritage sites throughout Europe and worldwide. The role of the experts, as well as the participatory engagement of audiences and stakeholders, is being redefined and reassessed. For example, the communication technique of facilitated dialogue is used by professional interpreters to connect and interact with audiences. Facilitated dialogue engages and fosters an environment where the experiences of participants are shared and explored. It is designed to join the experiences and expertise of participants to contemplate conditions and opportunities for impacting the topic or issue being discussed. Dialogue facilitators need not be topical experts, but they do need to have personal communication skills that enable as many people who want to contribute to do so yet allowing others to feel comfortable about not wanting to be actively involved in the dialogue. Facilitated dialogue is designed to engage and foster an environment

where the experiences of participants are shared and explored. The goal is to encourage an environment where people feel free to consider other perspectives (NPS 2015).

One possible concern to heritage specialists with facilitated dialogue is the deemphasized role of the resource expert and his/her intrinsic knowledge of the resource. Will this lead to programs being developed that discount this role or an attitude by management that experts are not needed, do not need to be hired, by management and interpretation entities? If so, does this represent a major conceptual shift in effective interpretation and presentation philosophy and practice?

Community empowerment is about working in ways in which people and communities become empowered, where power is shared with the experts, and refers to the process of enabling communities to increase control over their lives. In these settings, people are satisfied and confident within inclusive and organized groups where the formed networks are cooperative, supportive, and influential.

The Limited Effects of Official Documents, Guidelines, and Charters

At the same time, several international guidelines, although they address the need for community engagement, also serve to promote the agendas of the educated and privileged, carrying some form of AHD. For example, the Convention on the Value of Cultural Heritage for Society (Faro Convention 2005, Council of Europe) states that the community must be involved in cultural heritage management. The aforementioned ICOMOS Charter on the Interpretation and Presentation of Cultural Heritage Sites (the 2008 Ename Charter) also addresses the importance of local community involvement. Internationally, primarily in the West, national guidelines, such as the Burra Charter of 1979 and 2013 (Australia ICOMOS 2013), generally follow the 2008 ICOMOS Ename Charter guidelines in terms of definitions, concepts, and principles. These and other international guidelines, however, tend to be optimistic and positivist, in the sense that they reflect the definitions and engineering of the heritage domain through top-down instruction of archaeologists or heritage managers. As an example, Barry (2016) outlined the challenges of the Tell Balata Archaeological Park project in Palestine, where it is almost impossible to comply with such professional standards and to follow the 2008 ICOMOS Charter due to the political, social, and economic situation and a lack of recognition of, and respect for, multiculturalism (Jameson 2014).

The Continuing Challenges of Heritage Tourism

As alluded above, an important current and ever-growing challenge affecting the inclusiveness of heritage interpretation is the juggernaut of heritage tourism. Heritage tourism is a collaboration between conservationists and commercial promoters. In heritage tourism, the goal is to harness people's fascination and sense of connection to the past and turn it into a commodity. It is often an uneasy association because the motives of these respective groups are not always compatible. While there is general recognition that heritage tourism can work to promote preservation of communities' historic and cultural resources and also educate tourists and local residents about the resources, the resulting effects are not always viewed as beneficial, especially from those of us on the conservationist side of the fence. Nevertheless, because heritage tourism is a growth industry in almost every part of the world, the issues it conjures up – good and bad – must be addressed.

Globalization and global tourism are changing our world in ways that we are just beginning to understand. Heritage tourism, with its ties to the currents of rapidly evolving global economies, is causing increasing needs and demands for cross-cultural and international communication and interdisciplinary training. Greater importance is being placed on transferable skills such as the application of interdisciplinary approaches, writing for both academic and nonacademic audiences, oral presentation, experience with multimedia packages, and social media.

Heritage tourism run amok – when the relationship lacks conservation-driven decision-making and objectively derived value assessments – threatens or limits the goal of inclusiveness in interpretation by rendering

community and other stakeholder involvement superficial. Interpretation of the meaning of sites is inherently important to the conservation process and therefore plays a defining role in conservation/tourism interactions. Those of us whose primary goals and interests are conservation should be determined that our values and standards in this relationship are not compromised or diminished.

Interpretation as a Mechanism for Resource Sustainability

Much of the established principles for interpretation in the United States and internationally stem from the writing and philosophy of Freeman Tilden. Tilden (1957) defined interpretation as an educational activity that aims to reveal meanings and relationships using original objects by first-hand experience and illustrative media rather than to simply communicate information facts. Freeman's six principles emphasized relevance to the experience of the audience and interpretation as a teachable art form. According to Tilden, the chief aim of interpretation is not instruction but provocation and must address itself to the whole person rather than any phase. Tilden advocated what we would describe today as a "layered" approach to interpretation that considers the perspectives of a variety of audiences differentiated by age, sociocultural background, and other factors.

Later advocates have built on the foundations of Tilden and applied postmodern theoretical approaches. Jon Kohl (2003), for example, defines interpretation in terms of a "paradigm," a deeply embedded set of beliefs that together form a story or worldview. To Kohl, each culture has a story that explains its people's creation, significance, and destiny. This set of beliefs directs how they relate to resources. Kohl advocates expanding the scope and goal of interpretation beyond conservation goals toward an integration of "deep stories" that "carry it across the divide to conservation in the short-term and sustainability of natural and cultural resources in the long." For interpreters, he says, these changes will first be felt in conservation, a sector of sustainable resource management, and then later for sustainability issues in general. Kohl believes that effective interpretation in the future will involve a paradigm shift that rewrites the worldview script by interpreting new ideas and meanings in order to move society toward sustainability.

Interpretation Through Inspiration and Cognitive Connection

Many cultural heritage specialists today are not content to rely solely on traditional methodologies and analytical techniques in their attempts to reconstruct human history and bring it to life for people. They want to venture beyond utilitarian explanations and explore the interpretive potential of cognitive imagery that archaeological and cultural heritage information and objects can inspire. They realize the value and power of artistic expression in helping to convey this information to the public and are increasingly concerned with how the past is presented to, and consumed by, nonspecialists. They want to examine new ways of communicating cultural heritage information in educational venues such as national parks, museums, popular literature, film and television, music, and various multimedia formats.

Archaeology and archaeologically derived information and objects have inspired a wide variety of artistic expressions ranging from straightforward computer-generated reconstructions and traditional artists' conceptions to other art forms such as poetry and opera. Although some level of conjecture will always be present in these works, they are often no less conjectural than technical interpretations and have the benefit of providing visual and conceptual imagery that can communicate contexts and settings in compelling ways. Two such interpretive formats, two-dimensional paintings and popular history writing, are used by the National Park Service as public interpretation and education tools (Jameson et al. 2003).

Interpretation Practice

In the United States, the development of resource protection legislation and cultural resource management (CRM) strategies in the 1960s and 1970s, and the resultant very rapid accumulation of archaeological and historical site information

and collected artifacts, led to concerns for inclusiveness and sensitivity to heritage values of multidimensional communities and constituent stakeholders.

From the input of Freeman Tilden and the experience of NPS, the United Kingdom and Canada were two of the countries which began to introduce interpretation alongside conservation, first in natural surroundings and later in towns and historic sites. The Countryside Commission for Scotland and its sister organization in England and Wales produced a two-part guide to Countryside Interpretation in 1975, the year the Society for the Interpretation of Britain's Heritage was founded. It later became the Association for Heritage Interpretation. In North America, two organizations came together to form NAI, which was followed by similar bodies in Canada and Australia with a number of individual advocates located in other countries. Leaders such as Mark Sagan in the United States and Don Aldridge in the United Kingdom became spiritual successors of Freeman Tilden. They in turn inspired interpreters in Spain, Italy, Scandinavia, and elsewhere to take up the baton and introduce interpretation as a complement to environmental interpretation aimed at children.

By the late 1980s, many cultural heritage specialists in the United States and elsewhere were addressing the contemporary context of their research as part of a growing practical and ethical awareness. The 1990s saw the emergence of greater energy and funding devoted to the public interface of archaeology as the professional community became aware that intellectual introversion was no longer acceptable and that more attention should be paid to the mechanisms, programs, and standards of public presentation. In the face of an increasing public interest and demand for information, archaeologists and their cultural heritage colleagues began to more actively collaborate to devise the effective strategies for public presentation and interpretation. Until the 1990s, publications on public presentation and interpretation strategies and standards were rare and largely obscured in isolated accounts and academic gray literature.

By 2005, traditional definitions for the terms *heritage*, *historic*, *archaeological*, and *scientific* were changing to incorporate intangibles such as aesthetic, artistic, spiritual, emotional, and other values stemming from introspection and reflection. An expansion and broadening of the content of "archaeological knowledge," this term increasingly subsumed in professional practice parlance under the more general category of "cultural heritage," to be more inclusive and less authoritative has emerged, broadening the definition and meaning of "expert." An important result has been the emergence of the interpretive narrative approach in archaeological and cultural heritage interpretation, where heritage specialists actively participate in structuring a compelling story instead of just presenting sets of derived information. The interpretive narrative is used as a vehicle for understanding and communicating, a *sharing* as well as an *imparting* of, cultural heritage values within the interpretation process. This trend is resulting in profound ramifications for definitions of significance in heritage management deliberations and what is ultimately classified, conserved, maintained, and interpreted. It has changed the role we play and the values we present in historic preservation and education. It affects our strategies for conducting research and the public interpretation of that research. The challenge for heritage managers, archaeologists, cultural historians, and other resource stewards is to educate ourselves on the requisite knowledge, skills, and abilities to deal with these developments.

Paramount for professional educators and interpreters today is ensuring that their audiences connect with and understand cultural heritage values, those tangibles and intangibles that define what is important to people. They strive in these endeavors to develop more holistic interpretations in which the values of sustainable environment and heritage are inextricably linked. They also recognize that multidisciplinary, inclusive, and community-engaged approaches are the most effective. Heritage sites are no longer limited to great iconic monuments and places but include millions of places of importance to sectors of society that were once invisible or intentionally ignored. These under-recorded sites can play an

important role in fostering peaceful multicultural societies, maintaining communal or ethnic identities, and serving as the indispensable theater in which the ancient traditions that make each culture a unique treasure are performed periodically, even daily. The values of these previously ignored and heretofore low-priority sites and features are often not readily obvious in the material fabric or surrounding geography but today carry an imperative that they must be identified and require a narrative for the fullness of their meaning to be properly conveyed to local communities, site visitors, and the public at large. This is accomplished through processes of public interpretation, presentation, and education.

Interpretation is now a recognized skill and an essential part of managing special sites and protected areas worldwide. In many countries, there are degree and postgraduate courses in interpretation, which include interpretation alongside other subjects. Courses and programs are run for professional interpreters and for volunteers at heritage sites, museums, and visitor centers (Interpret Europe 2019).

Recurring Issues in Interpretation

Today, new philosophical and methodological trends in public interpretation are reshaping the messages delivered at archaeological and cultural heritage sites worldwide. The role of the expert, as well as the participatory engagement of audiences and stakeholders, is being redefined and reassessed. For example, as mentioned, the communication technique of facilitated dialogue is being utilized by professional interpreters to connect and interact with audiences.

Pervading the philosophical underpinning and evolving global history of public interpretation are several issues and questions that carry over to present-day practice and program implementation. Examples include:

- **Why interpret?**
  What are the categories and cultural, socio-political circumstances that surround and influence our decisions to interpret?
- **Devising effective mechanisms for securing stakeholder participation**
  How do we define and promulgate mechanisms for securing stakeholder participation in that there are no universally shared views on who qualifies as valid stakeholders?
- **Establishing acceptable boundaries**
  Establishing acceptable boundaries and better guidance on the interpretation of religious and sacred sites, places of memory, and "sites of conscience."
- **Debates surrounding the nature and circumstances of "authenticity"**
  The nature and circumstances of "authenticity" as it relates to both tangible and intangible heritage resources in both multicultural and more endemic societies.
- **Defining and identifying more inclusive target audience infrastructure**
  Defining "target audience" to include not only the professional preservation community but also the growing numbers of communities of specialists that conceive, design, and build interpretation programs and infrastructure that know little about the principles of heritage conservation and management.
- **Recognition that community participation, buy-in, and power sharing are essential**
  Many examples are emerging of a bottom-up approach where members of the respective communities provide feedback, actively participate, and *effectively change* the original design of the way cultural heritage is presented. Community participation and buy-in are essential ingredients for successful outcomes in terms of public understanding, support, and building collaborative relationships that effectively protect heritage sites and the dynamic traditions they represent.

Interpretation Organizations

Notably, in 2019, six of the largest heritage interpretation organizations in the world (Association for Heritage Interpretation (UK), Interpret Europe, Interpretation Canada, Interpretation Network New Zealand, Interpretation Australia, and National Association for Interpretation) have come together to form the Global Alliance for Heritage Interpretation advocacy organization whose stated purpose is to coordinate efforts in

support of individuals and interpretation groups around the world (NAI 2019).

The predominant interpretation agencies and organizations include:

- Asociación para la Interpretación del Patrimonio, Spain
- Association for Heritage Interpretation, UK
- Association for Living History, Farm and Agricultural Museums, USA
- Interpretation Australia
- Interpretation Canada
- Interpret Europe
- Interpret Scotland
- Interpretation Network New Zealand
- ICOMOS Charter for the Interpretation and Presentation of Cultural Heritage Sites, International
- ICOMOS International Committee on Interpretation and Presentation
- International Council of Museums (ICOM)
- National Association for Interpretation, USA
- National Park Service, USA
- Swedish Centre for Nature Interpretation
- Global Alliance for Heritage Interpretation

Conclusions

In modern contexts, applications of a participatory culture model and cultural specialist/lay person collaborative relationships are central components of effective interpretation of cultural heritage sites. Innovative participatory approaches, avoiding the pitfalls of authorized and elitist heritage discourses, are raising the potential of cultural resources to heighten public sensitivity to the rich cultural heritage these resources represent. These approaches serve to connect multiple perceptions of the past, all equally important, that must be transmitted or facilitated by the cultural heritage manager.

Many argue that the incorporation of local knowledge is important to the survival of archaeology and other fields of heritage studies as an academic discipline. Community involvement serves to end the elitism and exclusive control that heritage authorities have had over the material in the past, resulting in a "decolonized" archaeology, giving non-archaeologists a shared role in interpreting the past. The degree of interpretive control that communities have in archaeological projects can vary from using interview and consultation data to producing academic publications written by community members based on community-identified research questions. Project success requires investing the requisite time and resources to develop rapport and mutual respect with the local community. Today, experience has taught cultural heritage specialists to plan for long-term collaborations beginning at project inception (Nevell and Redhead 2015). Recent publications highlight alternative and innovative participatory approaches in cultural heritage management and interpretation. They also reveal a need to develop effective and sensitive interpretation in all communities (Jameson and Musteata 2019).

Fundamental Questions Going Forward

What are the new trends and transnational perspectives, as well as levels of communication – from local to regional, national, and international – on public interpretation of archaeological and cultural heritage? Do these activities represent new emphases in interpretation, and can they contribute to, or help mediate, dialogues between European identity and diversity of cultures? Can they be shared experiences as examples of best practice at national and international levels? What are the interpretation and presentation challenges for the future?

In our deliberations regarding who owns the past and what constitutes inclusive public interpretation, we can couch our discussions within the framework of attempting to answer some fundamental queries. While present and future deliberations will not easily resolve these questions, they continue to encompass many of the key issues (Jameson 2012).

Firstly, what constitutes an inclusive public interpretation of heritage? The Ename Charter on Interpretation defines "inclusiveness" as that which seeks to ensure that the interpretation of a cultural heritage site is not merely a carefully scripted presentation prepared by outsiders but

should instead actively involve the participation of associated communities and other stakeholders. In all aspects of site commemoration and site management, whether these are interpretive programs, exhibits, physical maintenance activities, or the effects of heritage tourism, according to the charter, an interpretation program must be seen as a community activity rather than something imposed by persons or institutions perceived to be outside the community. "Community" in this sense is simply a group or class having common interests, or likeness or identity. Communities include educational, professional, academic, governmental, descendant, local, or virtual. Communities are not discrete in that they can and do overlap. For example, members of a descendant community may also be part of the educational and the professional communities. In discussions of inclusiveness, our ideal for communities is that they be involved in participatory education and public interpretation where members of a community actively participate in developing, carrying out, delivering, or otherwise producing the program or elements of the program or interpretive product.

The second question we might pose is: does the term "inclusive" connote democratic or equal treatment? How does it relate to, appeal to, and be available to broad masses of people? If we accept the assumption that some form of multiculturalism is a necessary backdrop for inclusiveness, our approaches to commemoration and public interpretation should follow an objective process that seeks to identify the attributes, or values, inherent in the resource that make them important to people and therefore worthy of protecting, preserving, celebrating, and interpreting.

A third question comes to mind: in multicultural societies, how are standards of significance and authenticity promulgated and agreed upon, and how are they effectively formalized while accommodating multiple points of view in heritage interpretation? And, once commemoration standards are formalized in official management and interpretation oversight procedures, how are the values of immigrant and minority communities, as well as evolving values of the "majority," addressed and accommodated within the identification/commemoration process?

Public interpretation treatments worldwide run the gamut for tendencies of inclusiveness and exclusiveness. What does a Palestinian, or Palestinians as a group, believe as authentic and therefore worthy of protection and commemoration? How does this compare in terms of commonality of commemoration, sense of place and setting, etc., with the heritage values of Israelis for the same territory or site? Can divergent communities in terms of values and opinions on commemoration ever arrive at a consensus, or even develop a constructive dialogue, about the rights of inclusion in heritage interpretation and site management?

The last decades have witnessed a dynamic period of evolving standards and philosophy in public archaeology and heritage interpretation. Philosophical approaches and techniques exemplified by the US National Park Service's IDP program, NAI's Certification and Training Program, Interpret Europe's European projects on heritage interpretation, and the goals of the newly organized Global Alliance for Heritage Interpretation have formed a basis for the development of international definitions, standards, and collaborative approaches that lead to more effective strategies for site protection and interpretation through enhanced public stewardship. Discussions on issues such as authenticity and inclusiveness will continue to dominate international debates about the significance and proper use of sites. The challenges for international relevance and application posed by the ICOMOS Ename Charter initiative will form the center of future debates and deliberations. The goal of more inclusive interpretations will require an acceptance of divergent definitions of authenticity that depend on a level of tolerance of multiple definitions of significance with concomitant, objectively derived, assigned, and ascribed heritage values. We can hope that these efforts lead to the recognition of humanistic values that are reflected in cultural heritage narratives and heritage tourism practices as well as site commemoration and protection decisions by controlling authorities.

Cultural Heritage Issues in Africa

Edith Onkoba
Mombasa, Kenya

Introduction

Africa is a continent rich in diverse cultural and natural heritage. Most African countries, however, are facing major challenges in preserving this heritage. According to various Africa's Periodic Reports prepared by the World Heritage Centre and presented to various sessions of the World Heritage Committee, these challenges include development pressures, lack of human and financial capacity, and inadequate legislation (World Heritage Committee 2002). It has been argued that some of these challenges stem from a lack of appreciation of the role that heritage can play in sustainable development (Makuvaza and Chiwaura 2014). This is partly because African policy makers still regard archaeology and heritage management as colonial pursuits that fail to generate tangible benefits to their economies (Schmidt 2017a). The result is that heritage issues have a low priority for most African governments leading to provision of low budgetary support to those institutions responsible for cultural heritage management. This leads to poorly paid staff with inadequate specialist skills. This entry will briefly look at some of these challenges.

Definitions

This entry considers the trends that are occurring in the African continent. There are 54 countries in the African continent. UNESCO, however, has grouped the African continent into two regions, the African region that covers all countries in sub-Saharan Africa and the Arab region that covers countries in Northern Africa (Arab-speaking African countries: Algeria, Egypt, Libya, Morocco, Sudan, and Tunisia) and extends to Arabia. The African World Heritage Fund (AWHF), however, deals with the entire African continent as one unit, and this is the perspective that this entry will take. While the examples discussed here only apply to countries in sub-Saharan Africa and especially those in Eastern and Southern Africa, these examples, however, provide insights into the critical issues that are important to cultural heritage and sustainable development throughout the continent as a whole.

The definition of cultural heritage for this entry is drawn from ICOMO's (2002) definition that sees cultural heritage as an expression of the ways of living that a community develops and

thereafter passes on from one generation to another. Most scholars now acknowledge that heritage is not only manifested through tangible forms such as artifacts, buildings, or landscapes but also through intangible forms such as voices, music, dances, values, traditions, and oral history (Abungu 2012; Kiriama 2009). The intangible dimensions of cultural heritage act as a means of preserving the links between the past and the present and also allow the transmission of its different shades and colors to future generations (Kiriama 2009). UNESCO (2003) defines intangible heritage as a "people's learned processes along with the knowledge, skills and creativity that inform and are developed by them, the products they create and the resources, spaces and other aspects of social and natural context necessary to their sustainability. Intangible cultural heritage is transmitted from generation to generation, and is constantly recreated by communities and groups in response to their environment, their interaction with nature and other people, and their history and it provides communities with a sense of identity and continuity."

Historical Background

Most African countries save for Ethiopia were under various colonial administrations for most of the nineteenth and twentieth centuries. During the colonial period, only those heritage places that enabled the colonial government to achieve their colonial objectives of colonialism were preserved; for instance, in Rhodesia (present-day Zimbabwe), the colonial government argued that the site of Great Zimbabwe had been built by conquering Phoenicians, showing that local inhabitants had no capacity for such developments, and therefore it was the duty of the colonialists to govern the country in order to enlighten the populace and in the process denying "the legitimacy of local narratives that omit discussion of colonialism or that do not arise out of colonialism" (Schmidt and Pikirayi 2018: 447; Sinamai 2019). From the mid-twentieth century, however, these countries started gaining independence, and some of them utilized the heritage places to assert their new found identity; for instance, Rhodesia took the name of Zimbabwe as name for the country (Sinamai 2014).

The years 2010–2015 witnessed most of sub-Saharan Africa striving to achieve lower or upper middle-income status within the next 15 years. This aspiration has been enshrined in the development plans and economic policies of these countries. The end result is that most heritage places have come under pressure to give way to the development of infrastructural projects that can enable these countries to achieve this intended goal. The dilemma that many of these countries are facing now is how to balance the development needs with conservation of their heritage (UNESCO 2015).

Key Issues and Current Debates

Development Pressures

Most African countries are facing unprecedented population growth. In 2019, the total African population is projected to be 1,287,920,518 people. This growing population is accompanied by migration from the rural areas into the cities and the coasts (Breen 2014). One result is that cultural sites in cities and along the coasts, such as open spaces and historic buildings, bear the brunt of this migration by being demolished to give way to high-density buildings and infrastructure. Moreover, the increased population in urban centers motivates local authorities to shift budgetary resources from heritage conservation to the provision of basic needs for the population; hence, low investment is put into heritage conservation. In their quest to uplift the livelihoods of their people, African governments, with assistance from their development partners, are investing heavily in infrastructural developments such as construction of roads, rail, airports, energy supply facilities, and telecommunication networks. These developments have had adverse effects on heritage resources. For example, the Chinese government is helping Kenya, Ethiopia, and South Sudan to develop the Lamu Port South Sudan Ethiopia Transport (LAPSSET) project.

This is going to see construction of rail, road, airports, and a port from Lamu on the northern Kenya coast up to Juba in South Sudan and Addis Ababa in Ethiopia. This project will be undertaken in areas, especially Lamu and southern Ethiopia, that have archaeological sites dating to millions of years ago as well as historic buildings dating to the nineteenth century CE. Inevitably, some ancient sites as well as historical buildings will be impacted negatively. In Lamu, some communities are up in arms against the project because of fears that it will negatively impact on heritage resources (Basravi 2019). Another example is in the Central Rift Valley of Kenya where rapid population growth has resulted in a population density of 191 persons per square kilometer. This has put pressure on the Nakuru-Naivasha Basin which is home to some of the archaeological sites that have yielded significant data on the evolution of human societies (Government of Kenya 2009; Nyanchoga 2012; Wilshaw 2012; Frahma and Tryon 2019).

The discovery of oil and minerals in most African countries and the belief that these resources are a panacea to the poverty of Africa have led to an emphasis being placed on the exploitation of these resources. However, the utilization of these resources is associated with massive infrastructure development which poses a danger to heritage. For example, many heritage sites in Zimbabwe, Cameroon, and Swaziland are threatened with destruction as a result of the increased exploitation of minerals. For instance, Swaziland withdrew the Ngwenya Middle Stone Age ochre mines from the UNESCO World Heritage Sites nomination list in order to allow the government to revive industrial iron ore extraction in the area (Ndlovu 2016). Other African World Heritage Sites facing danger because of mining activities include Mount Nimba Strict Nature Reserve (Cote d'Ivoire and Guinea – iron ore mining), Virunga National Park (DRC – oil drilling), Selous Game Reserve (Tanzania – uranium mining), and the Mana Pools National Park, Sapi and Chewore Safari Areas (Zimbabwe – heavy mineral sand deposits) (Osipova et al. 2017). Lake Turkana in northern Kenya, with its associated hominid sites (Leakey and Walker 1988; Brown et al. 2001), is threatened as a result of the damming of rivers that feed the lake by the Ethiopian government. Similarly, the Mapungubwe Cultural Landscape in South Africa, though the home of a thriving Kingdom between the late eleventh and early thirteenth centuries and was listed on the World Heritage List, in respect of its significance as an archaeological site that offers an important insight into Southern Africa's early civilization, is, however, now faced with threats from mining and need for more energy (Meskell 2011; Ndlovu 2016). On the other hand, infrastructure development also provides an opportunity to survey areas that were previously unknown and thus contributes to improving our knowledge of the past. However, at the moment, this development poses greater threats than benefits to Africa's cultural heritage. The World Heritage properties of the region also pay a heavy toll to the increasing need for energy. Indeed, mining operations (exploration and/or exploitation) affect 27% of the properties and oil and gas exploration/exploitation 14%. When the dam projects (14%) are added, this leads to nearly one property out of three (35%) of heritage sites that are impacted in the region (Osipova et al. 2017).

Inadequate Financing

Development pressures and the provision of essential services, such as education and health services, along with a poor understanding of the role that heritage can play in sustainable development, has led to small budgetary allocations for heritage conservation. The result is that most heritage sites in Africa – even those with a recognized high value – have been neglected. A case in point is the Khami site in Zimbabwe, which, despite being on the UNESCO World Heritage List, has seen minimal financial allocation to it by the Zimbabwean government. The result is that the site has been left to go into ruins (Sinamai 2019). The focus by governments on meeting the basic needs of their people has led to inadequate funding of antiquities departments making it difficult for these departments to attract the best talent or

pay the salaries needed to retain talented individuals; therefore, there is a high staff turnover which leads to limited institutional memory (Deacon 2014). In addition, the lack of sufficient funds has made it difficult for African countries to support the nomination of their sites to the World Heritage List or indeed the proper management of those sites already inscribed in the List; this has partly led to Africa being underrepresented in the List while at the same time being overrepresented in the List of World Heritage Sites in Danger (Makuvaza and Chiwaura 2014). However, there is a counter-argument that some national heritage institutions do not prudently use the available resources. Irrespective, low budgetary allocation has negatively affected the management of heritage resources in most African countries.

Weak Legislation and Weak Institutional Frameworks

Every heritage conservation decision is based on the values of that heritage. Unfortunately, in many African countries, the legislation does not make it clear how to define the values that attend cultural heritage (Gwasira 2005). Further, most African legislation stems from the colonial past of that specific country and tends to emphasize the protection of physical heritage more than the protection of intangible heritage. This is because in Europe, monumentality or physicality of places was for a long time considered as the embodiment of heritage, and therefore any legislation that was enacted was meant to take care of the tangible aspects of heritage and not the intangible elements. In addition, the continued use of this colonially influenced legislation in the post-colonies has seen the communities, who traditionally have been the keepers of heritage and who are the major stakeholders in the continued existence of the heritage, kept at the periphery of key decision-making concerning that heritage (Gwasira 2005; Sinamai 2014). Another problem is that most African heritage legislation is weak and therefore cannot adequately protect heritage resources. For instance, in the majority of African countries, the legislation does not demand that heritage impact assessments are carried prior to any development, even in areas that are rich in heritage resources. Where such legislation is available, it is so weak that it cannot be enforced. In Kenya, for example, the National Museums and Heritage Act of 2006 requires an impact assessment to be done prior to commencement of any development project. This requirement is, however, premised on the fulfillment of the requirements of the Environmental Management Act (EMCA). In other words, a developer is told to comply with the EMCA, and when that is done, they are free to continue with the project. The EMCA, however, deals only with the physical environment and not with cultural heritage. The result is that most developers do not engage an archaeologist or heritage practitioner to carry out a dedicated assessment of the cultural heritage.

These deficiencies in legislation are exacerbated by weak institutional structures. In some African countries, heritage institutions are placed into government ministries where heritage is given low priority. For instance, national heritage institutions may be placed under the Ministry of Constitutional Affairs or the Ministry of Home Affairs which is also responsible for internal security. As Mahachi and Kamuhangire (2008) point out, the priority of such ministries cannot be heritage conservation. In my view, heritage can only be afforded sufficient protection when it is included in the title of a designated ministry, such as heritage and environment. In this situation the ministry has a mandate to protect heritage.

Low Levels of Local Participation

The combination of archaic legislation and inadequate financial support has made it difficult for most heritage institutions in Africa to involve local communities in decision-making regarding the conservation of heritage resources. A failure to include them in decision-making has made many local communities detached from the conservation of the sites. This can lead to the destruction of important sites as the local communities want to know how they can benefit from these sites (Chirikure and Pwiti 2008). Ironically, this situation can emerge from the listing of a site as national heritage. A case in point is the Sacred Mijikenda sites in Kenya. After they were listed as

national monuments, the local communities that hitherto had cared for the sites were forbidden from doing so. This led to the destruction of some of the sites by people who previously had feared the wrath of the traditional custodians if they interfered with the forest (Kiriama 2013). In addition, due to lack of local involvement in policy making and a lack of financial and human capacity to manage the sites, the sites of Shanga and Pate in the north coast of Kenya are slowly being destroyed by the local community, who want farming land, in case of Pate and grazing land for their animals, in the case of Shanga (pers. Obs). These issues can be addressed more effectively through an increase in local participation in site management.

Inadequate Training and Capacity Building/ Lack of Enough Specialist Human Resources

Most African countries have inadequate expertise and experience in heritage management. It is only very few countries in Africa that have colleges/ universities that teach heritage conservation and management. In those countries where these courses are taught, the few students who are willing to study heritage management are unwilling to work for government heritage departments after graduation because of poor remuneration; they instead work for private companies or other organizations with higher salaries. This has made it difficult for these African countries to use their heritage resources for the sustainable development of the local communities. The site of Kilwa Kisiwani in Tanzania is an example of a site that was destroyed because experienced staff refused to work there as a result of poor pay offered by the government and the location of the site in a remote part of Tanzania (Sinamai 2019).

Gender Inequities

Many discourses on heritage as well as exhibitions tend to ignore gender issues. Therefore, the stories told at heritage places and museums tend to convey and legitimize gender stereotypes of men and women (Smith 2008). In the end this perpetuates societal gender inequality. This perpetuation of gender inequality can be seen within the sacred Mijikenda Kayas of the Kenya coast. The Kayas are the sacred forests of the Mijikenda people of the coastal belt of Kenya. These forests are important both for their ritual power and as centers of cultural identity of the Mijikenda; people go to the Kayas to hold prayers either to seek guidance or when calamitous times hit the community. The Kayas become significant ritual places because they are the resting (burial) places of the ancestors – who are now spirits that mediate between the living and the god of the Mijikenda. Consequently, any prayers that either the community or individuals need to offer have to be done in the Kayas but with the assistance of the ordained Kaya elders, who are believed to be the mediums between the ancestors (the dead) and the living. The Kaya elders pray on behalf of the affected person to the ancestors who in turn pass the request to god. These ordained male elders, who form the council of elders, are the custodians of the Kaya forests. They enforce sanctions against anybody who goes against the rules and regulations that govern the Kayas. Consequently, for a long time, it has been assumed that women do not play a role in the management of the Kayas. Though the management of the Kayas is vested in the council of elders which, on the surface, seems to comprise only men, women, however, are also members of the Kaya management, and they play an important role in ensuring adherence of the Mijikenda beliefs and customs.

The Kaya rituals and ceremonies have their symbolism built around the concept of the home and village (Mitzange and Giles 2014). Therefore, big ceremonies for the entire village are not done before a ritual clearing of the paths, and cleaning of the central space has been done by the women elders. There are two types of Kaya women elders, one is the Wanguchi (Akuzi) and the other is the medicine women (waganga). The medicine women are responsible for anointing the house of God (Kadzumba ka Mulungu) immediately after it has been constructed by the elders. The women elders also prepare the food offerings for the gods. No ceremony can be complete and accepted by the gods without the food offerings. In spite of this important role women elders

play, they are not publicly acknowledged as elders. Indeed, the role that women play is overlooked or considered as nothing by the community, and yet no ceremony can continue if the women refuse to play their part. In everyday life of the community, both women and men take for granted the various roles that women play in the Kaya; "it is their duty," it is often said. The elders however aver that women are an important component in the life of not only the Kaya but the community as a whole because the well-being of the community is dependent on the fullness of the ceremonies carried by the entire Kaya eldership – both male and female. The consequence of this omission is that stories of women within the Kayas are not told, and therefore any conservation efforts that are made do not involve the input of women. This is the same case in most other African countries as well.

These issues partly arise as a result of the cultural change that most African countries are going through because of westernization. The end result is the depreciation of intangible heritage – "the neglect of the materials imbued with meaning" (Schmidt 2017b: 235) – and this leads to lack of appreciation and therefore neglects destruction of the heritage that is connected with these intangible elements.

The Relationship between Donors and NGOs

In most African countries, development partners that include governments and nongovernmental organizations (NGOs) have been the driving force for the protection of heritage sites (Segobye 2006). One problem that has been cited for this involvement of NGOs in heritage conservation is that they tend to dictate what aspects of heritage that should be conserved and who should be involved, even if this is against the wishes of the local community. For instance, in some places, tradition demands who should and should not enter into a sacred place, but when a site is being conserved using donor funding, sometimes this aspect is overlooked to the chagrin of the local community. The result is that the community may refuse to be associated with the site. Another issue is that reliance on donor funding may lead to a dependency syndrome. When the donor funds dry up, governments do not take any steps to support the conservation of the affected sites. Further, if there are strained relations between countries and the donors pull out, the sites that were supported end up suffering as a result of this withdrawal. For instance, when Western countries imposed sanctions on Zimbabwe in the 1990s because they did not agree with the policy directions of the then Zimbabwean government, funding for major heritage sites was also withdrawn. This has had a negative impact on the conservation of these sites (Sinamai 2019).

Conflict and War

A number of African countries have seen conflicts within themselves or with neighbors. This conflict has affected many sites in these countries. For instance, places of worship have been targeted in Mali, Nigeria, Kenya, and Egypt. The Arab spring that affected the countries of North Africa has also been associated with the looting of sites (Al Azm and Paul 2017; Doppelhofer 2016). In the Democratic Republic of the Congo, the conflict has seen most of its World Heritage Sites placed on the List of World Heritage Sites in Danger (Kiriama 2014). The conflict in Somalia has not only affected research and the proper documentation of its heritage sites but also has affected the care and protection of Kenyan heritage sites on the Somalia border. Important sites such as Ishakani in Kiunga that has a thirteenth-century doomed mosque and is only one of the three domed mosques in Kenya have been allowed to become derelict because of insecurity caused by the Somalia conflict. In Mali, ethnic, religious, and political problems have impacted negatively on the sites of Timbuktu and the Tomb of Askia (Thiaw 2014; Silverman and Ruggles 2007).

Risk Preparedness

The majority of African countries have not put in place risk management protocols to protect their heritage resources from unforeseen disasters such as fire, earthquakes, and armed conflict. For instance, the Kasubi Royal Tombs in Uganda and the Royal Palaces of Abomey in Benin were destroyed by fire (Butagira and Haywood 2010;

World Heritage Centre 2009); available evidence indicates that the governments concerned had no risk control measures in place.

Unresponsiveness of Heritage Managers

Some heritage managers do not sensitize policy makers and administrators of the role of heritage in national development. Therefore, instead of collaborating with other government agencies, they become arrogant and refuse to compromise with other stakeholders, making it difficult for government to carry out development projects. It is important for heritage managers to be cognizant of the role of government in promoting the livelihoods of its populace and to seek to a middle ground where heritage and development can coexist.

Illegal Activities

Another key threat affecting the conservation of the heritage places in Africa is related to illegal human activities such as poaching, illegal logging, and destruction of heritage, as well as illegal settlements (UNESCO 2002).

International Perspectives

While this entry has focused on cultural heritage issues in Africa, many of the concerns raised here are also relevant to the sustainability of heritage in other parts of the world, particularly in relation to tourism and human rights. In Latin America, for example, the Second Cycle of the Periodic Reporting Exercise done by the UNESCO World Heritage Centre identified the lack of management capacity and expertise as one of the many issues that some countries in the region face (World Heritage Centre 2014; Kiriama et al. 2010; Ndoro et al. 2018; Sam 2014). The same Second Cycle of the Periodic Reporting for the Asia Pacific region done in 2012 shows that similar issues have been raised for parts of Asia and the Pacific (Taylor 2004; Henderson 2012; World Heritage Centre 2012).

In addition, some of the concerns raised in this paper are also relevant to countries with high incomes (Graham et al. 2005). Concerns about the coexistence of development and heritage have been raised in Japan (Kakiuchi 2014; Matsuda 2014), Australia (Carter 2010; Marsh 2013), and North America where development pressures are threatening a number of heritage sites in the region (Meier 2013) and Europe (Guštin and Nypan 2010; EU JPI 2009; Bartel-Bouchier 2013; Moukala and Odiaua 2018). These are all legitimate concerns. The situation in Africa, however, is particularly dire due to the confluence of the wide range of factors described in this entry. In Africa, the threat to cultural heritage is both imminent and extreme. Immediate action needs to be taken (Kiriama et al. 2010).

Future Directions

This entry has briefly discussed the issues that heritage in Africa is facing. It has been shown that most of the issues stem from the fact that African leaders and policy makers still do not understand the role that heritage can play in sustainable development. Consequently, this leads to development of policy or lack of development of policies that can adequately support heritage conservation. This then leads to misplacement of heritage administrative units that in turn leads to low budgetary allocation which in turn leads to lack or engagement of poorly trained staff and therefore improper management of heritage resources. It is however gratifying that the African Union, in its Agenda 2063 that intends to turn Africa into a middle-income continent by 2063, has recognized heritage as one of the important pillars that should be used to attain this goal. As a result, African governments are being encouraged to set aside a substantial amount of their national budgets for heritage activities (African Union).

Cultural Heritage Management and Armed Conflict

Dacia Viejo-Rose
Department of Archaeology, University of Cambridge, Cambridge, UK

Introduction

Cultural heritage and armed conflict are two domains that sit uncomfortably side by side and yet are irrevocably linked. In the violent and volatile circumstances that characterize armed conflict, cultural heritage is often caught in the crossfire: deliberately targeted, looted, vandalized, its ownership contested, and its meanings reinterpreted by confronted sides. Recent conflicts have also shown how cultural heritage can be instrumentalized in order to drive cleavages between communities. Cultural heritage sites have been taken hostage and are employed as bargaining chips, or their destruction used to send intimidating messages. It is not surprising then that the management of cultural heritage during armed conflicts poses a considerable challenge.

Cultural heritage is managed at all stages in a conflict cycle, from the initial sabre-rattling through the phases of the conflict and right to the reconstruction process. The management of cultural heritage before armed conflict takes the form of preventive actions, preparedness training for site managers and museum staff, and training for military personnel including informing them of what responsibility international treaties hold them accountable for. The management of cultural heritage during armed conflicts often becomes a race to secure and evacuate movable heritage, prevent destruction form "friendly" fire, and alert customs officials in order to stem the seemingly inevitable flood of illicitly obtained archaeological and other heritage objects that comes from the region in turmoil. Once a conflict formally ends, the efforts to restore, recover, return, and repair the damage to cultural heritage begin.

Definition

Cultural heritage is a rapidly growing field of fundamental contemporary significance. Diverse institutions, political movements, and communities of all sizes have been recurring to it as a core element of identity formation, an object and tool of contestation, a basis for rights claims, and a resource in development strategies. Cultural heritage is and always has been political, it has and always will be a part of armed conflict, and yet many have noted a recent intensification in the scale and complexity of these ties (Meskell 2015; Viejo-Rose and Sørensen 2015). Once seen as the tame realm of amateur antiquarians, its contested nature is increasingly coming to the fore as much in the highly mediatized acts of deliberate destruction as in fervent debates about protection strategies; this is nowhere more explicit than during armed conflicts.

Armed conflict critically impacts on cultural heritage in all its variety of forms and manifestations; in the process, heritage is managed and mismanaged, protected and neglected, and used and abused. The contact begins already before the first shots are fired when propaganda battles are ignited, redrawing lines of belonging and exclusion, of "us" and "them." The violence against cultural heritage escalates during actual periods of combat as a further dimension of physical violence becomes a demolishing force. And, in the aftermath, with a transformed landscape as a base, the conscious (re)construction of

a new vision begins with its selective regard toward the remains of the past.

Historical Background

Prevention and Protection

In response to destruction, the actions that have been most developed thus far are the pairing of prevention and protection. Efforts to prevent the destruction of cultural heritage in the event of armed conflict have evolved along two main lines. The first, and most important in terms of the volume of work accomplished, is the legislative. Attempts to control the wartime destruction and plunder of cultural property go back to the 1500s (O'Keefe 2006), yet the Lieber Code of 1863, prepared during the American Civil War (1861–1865), is often cited as the first stage in this process of codification (Schindler and Toman 1988). This code was also a precursor to the first attempt to codify customary international rules regulating this kind of action with the 1907 Hague Rules (O'Keefe 2006; Hadik 2001). Today, the Convention on the Protection of Cultural Property in the Event of Armed Conflict (Hague Convention, 1954) and its subsequent protocols (1999) are the principle instruments. Furthermore, many of the basic principles concerning respect for cultural property present in the convention have become part of customary international law (Toman 1996). It is important to note that the two key moments in the drafting of this convention were wars in which the destruction of cultural heritage became an important bellicose act, the Second World War and the wars of the 1990s in the former Yugoslavia, respectively. Then, in the wake of the destruction of the statues of Buddha in the Bamiyan Valley of Afghanistan, UNESCO's General Conference approved a declaration concerning the intentional destruction of cultural heritage in 2003.

The second prevention line has involved training and sensitization programs directed at heritage professionals and military personnel. Here the International Committee of the Blue Shield and UNESCO have taken important steps. The Blue Shield is a protective emblem created by the 1954 Hague Convention and intended to function as the cultural equivalent of the Red Cross. The International Committee of the Blue Shield, established in 1996, comprises representatives of the five NGOs working in the field: International Council on Archives (ICA), International Council of Museums (ICOM), International Council on Monuments and Sites (ICOMOS), International Federation of Library Associations (IFLA), and Coordinating Council of Audiovisual Archives Associations (CCAAA).

Several intergovernmental and professional organizations as well as numerous NGOs also do considerable work directed at preventing the destruction of cultural heritage during armed conflicts by establishing professional networks, offering training, communicating information about existing protocols and legal instruments, administering exchange programs, and developing sensitization campaigns around the issues. Aside from those programs specifically relating to armed conflicts, there are also valuable initiatives (e.g., numerous ones by the Getty's research and conservation institutes) that explore the values of cultural heritage; how these are constructed, selected, and communicated, and the conflicts that might arise over different valuations. This is an important part of preparedness as it begins to map out where the vulnerabilities of sites might be should conflict break out and it links in with a broad range of work on contested heritage (Silverman 2011).

Protection if perhaps a less straightforward action than might appear at first glance, for the act of caring for heritage, has the effect of signaling its importance for one group, even when that groups speak in the name of "humanity." Gestures of destruction and of protection both have symbolizing effects tying the objects of their attention to a set of values. "The history of iconoclasm," writes Gamboni "[. . .] recommends certain objects to the care of those who share these values but attracts the aggression of those who reject them or who feel rejected by them" (Gamboni 2011: 11). And the instruments created for the, selective, protection of culture have also involved important degrees of appropriation and disowning. The two world wars prompted attempts

at the international management of both armed conflicts and cultural heritage with the two merging in the 1954 Hague Convention. The debate continues, however, about whether signaling something out for particular protection turns it into a target, a debate that in part informed the 1999 Second Protocol of the Hague Convention amid fears that sites in the former Yugoslavia had been targeted *because* they were marked out as heritage. Yet protective strategies have also evolved considerably through initiatives working in parallel to, complementing, or completely separate from the international legal instruments. Notable among these are the collaborations of heritage academics and professionals with military and police outfits. The Blue Shield in particular has led in this area. The Blue Shield is in an advisory body that was set up as the 1999 Second Protocol of the Hague Convention was being prepared, by the joint action of the International Council of Archives (ICA), the International Council of Museums (ICOM), the International Council on Monuments and Sites (ICOMOS), and the International Federation of Library Associations and Institutions (IFLA). Often referred to as the "Red Cross for culture," it is nonetheless significantly different in terms of its longevity, being barely 20 years old; finances, having none to speak of; and staff, having no permanent staff (Stone 2016). The Blue Shield works with the military in a four-tier approach responding to the different phases of the conflict cycle: immediately pre-deployment, during conflict, during post-conflict stabilization, and long-term (Stone 2013).

Key Issues and Current Debates

The key issues today are numerous, which include issues about practice and also about more comprehensive understandings of the relationship between cultural heritage and armed violence. On the practical side, the issues are about improving pre-conflict preparedness, developing responsive action in the face of fatalism when the fighting begins, and developing comprehensive recovery and reparation strategies that genuinely consult with the communities affected and not only with post-conflict reconstruction "entrepreneurs." On the more conceptual side, the issues are about mapping the polysemic interpretations of sites, the values that they are used to project, and the symbols and narratives that they are integrated into; unpacking the often multilayered motivations underlying destruction, and assessing the nature of the harm caused by it including taking full account of intangible manifestations of cultural heritage.

Preparedness involves a combination of analysis and planning; aside from practical technical measures, it essentially takes the form of training programs and the establishment of emergency protocols, and it is an area in which the specialized agencies, both intergovernmental and non-governmental, have assumed a great deal of leadership. For instance, the International Centre for the Study of the Preservation and Restoration of Cultural Property (ICCROM) runs regular workshops aimed at training heritage professionals to assess risks, identify key stakeholders, take preventive actions, improve response, establish networks, and apply relevant international legal instruments. Other examples include the publication edited by ICOM entitled "Cultural Heritage, Disaster Preparedness and Response" (2003) and the Prince Claus Fund's Cultural Emergency Response program.

Responses to destruction once fighting has begun involve close monitoring of the conflict in ways that combine satellite imagery and sources on the ground, military expertise, and heritage expertise. Together these collaborations can indicate what sites are likely to be targeted, can communicate the coordinates of sites to be avoided by military interventions, and can help collect evidence to track and stem the illicit trafficking of artefacts. What all responses need is a much more joined-up approach that addresses not only one dimension of the destruction but the whole picture. Illicit trafficking is a good case in point; whereas efforts have often focused on the act of looting, there has been less of an effort to tackle the demand side, the market, dealers, and collectors that make looting profitable in the first place (Brodie 2015).

Addressing the UN Security Council in March 2017, the Director General of UNESCO stated: "The deliberate destruction of heritage is a war crime, it has become a tactic of war to tear societies over the long term, in a strategy of cultural cleansing. This is why defending cultural heritage is more than a cultural issue, it is a security imperative, inseparable from that of defending human lives" (http://en.unesco.org/news/security-council-adopts-historic-resolution-protection-heritage). During this meeting, the Security Council adopted Resolution 2347, the first ever to focus on cultural heritage.

The Nature of Destruction and Harm

In order to develop comprehensive recovery and reparation strategies, it is important to be able to estimate and understand both the nature of the destruction and of the harm done. Once an armed conflict begins, the management of cultural heritage becomes increasingly complicated. One measure put forth in the existing literature is response, defined as "the action taken during the period of an actual emergency to minimize its effect on both life and property" (Boylan 2003: 66). Behind the modestly calm appearance of this phrase, however, lie the chaos and confusion of war, in the face of which even heroic efforts are often frustrated. A moving, literally blow-by-blow, account of the struggles faced by the museum's staff, and some of its civilian neighbors, to safeguard the National Museum of Baghdad during the 2003 invasion was documented by Donny George (2008: 97–107).

The dangers to which cultural heritage is exposed during armed conflict come in a myriad of ways; there are those that have to do with human resources such as weakened governments, disrupted professional activities, collapsed rule of law, and personnel denied access to the heritage sites and collections under their care. Then there are the dangers posed to the material integrity of heritage sites: collateral damage, misuse (as defined by the 1954 Hague Convention), looting, vandalism, and deliberate targeting – expressed not only by the destruction of monuments and objects but also the persecution of particular cultural groups, artists, intellectuals, crafts persons, and religious leaders. And there are also the dangers related to the instrumentalization of the symbolic meanings associated with cultural heritage whereby "ownership" is reassigned – i.e., this represents "us" and that represents "them" – and conflicts are pitted as black-and-white scenarios that forcefully categorize differences into opposed factions, leaving no room for the nuances and hybrid alternatives more true to life. It is in this third area that the much work has yet to be done, for the current understanding of the complex nature of cultural heritage, with all of its multifaceted ramifications, and has yet to be mirrored by an equally substantial appreciation of how it fares in situations of armed conflict.

While the development of a typology might seem a futile exercise when trying to pin down actions carried out in highly volatile conditions, mired by a web of political, social, and cultural subcurrents, it can at least help to bring out precisely that complexity of interactions. Table 1 indicates two elements in developing a typology

Cultural Heritage Management and Armed Conflict, Table 1 Destruction of cultural heritage during armed conflicts: a typological exercise (revised version of Viejo-Rose 2007: 104)

Destructive action	Object destroyed or damaged
Looting and pillaging Deliberate misuse/reuse Deliberate targeting (frontlines) Deliberate targeting (behind frontlines) Neglect Vandalism Collateral damage Military imperative Iconoclasm Official policy of selective abandon Failure to safeguard Disrepair	Museum and/or collection Heritage site Archaeological site Library or archive Civilian building (i.e., school) Historical monument Religious building/objects Cemetery Memorial Government building Political monument Infrastructure (bridges) Tourist infrastructure Natural heritage
Enemy image propaganda Symbolic/cultural violence Appropriation Misrepresentation	Historical narratives Constructions of identity (group belonging) Ownership and significance Sense of belonging (to a place)

of destruction: the violent action itself and the object targeted. Depending on which combination is made when linking the act with the object targeted, a different story emerges. For instance, the purposeful neglect of a piece of public art suggests different motivations and expected outcomes than the deliberate targeting of an archive. A further indicative element to take into account is the type of armed conflict and its contextual specificity. Armed conflicts come in a variety of forms, and most recently there have been conglomerates of different types: declared wars and international armed conflicts, occupations, and non-international armed conflicts (which can easily become a fuzzy category if a third state, or multinational force, becomes involved or if the conflict spreads across a border as soldiers and refugees move), and finally there is the nebulous category of terrorism and counter-terrorism (i.e., the "war on terror"). Thus, understanding the nature of the destruction of cultural heritage during armed conflicts –getting at the underlying motivations, dynamics, and impacts – cannot be approached as a uniform, blanket action. Developing a typology of the destruction of cultural heritage can be a useful tool to this end as long as the dynamics of particular historical and social contexts are not taken out of the picture (Gamboni 2007: 22–24).

As indicated at the outset of this entry, while the destruction of cultural heritage during armed conflicts is not new, there is certainly a sense that its intensity and global reach of these highly performative acts is a relatively recent phenomenon. What a schematic typology can help us do is, when complemented with further information about the context of a given conflict and the means by which the acts of destruction are communicated, to allow us to begin to develop a more complete vision of the motivations, aims, and impact of these. This in turn helps to understand the nature of the violence, for instance, whether it is systematic and sustained, opportunistic and media oriented, and how to address it. Constructing this deep and contextualized understanding of the destruction is fundamental, not least because it will help understand how the uses of heritage, often in the name of protection, turn it into a particularly attractive target. The outrage caused by such destructions often incites fiery retorts denouncing the destroyers as barbarians, yet failing to place these acts within the context of the specific political genealogy in which they take place makes protection measures clumsy at best. In the case of Iraq, for instance, this means understanding the long history of archaeology in the country and its political uses by national regimes, colonial powers, and other international actors including museums and archaeologists (di Cesari 2015).

Reconstruction, Recovery, and Reparations

International law has for the most part focused on imposing obligations on states to preserve, protect, and prosecute the destruction of cultural property, yet treaties remain silent on guiding the reconstruction and reparations process with regard to cultural heritage. Moreover such treaties concentrate on the physical manifestations of heritage, neglecting its more intangible dimensions which war also damages and transforms.

In the aftermath of armed conflict, cultural heritage can be used to serve a number of functions acting simultaneously as receptor, container, and reflector of meaning and emotions. Whether it is rebuilt, restored, ignored, or preserved in a ruined state, each action will be presented and interpreted as part of the construction of the new, post-conflict, society. Considering the points made above, concerning how conflict not only destroys but also transforms cultural heritage by adding and altering meanings and how the intangible dimensions are also targeted, it is then possible to appreciate that the post-conflict management of cultural heritage occurs on the basis of a transformed symbolic landscape and that the intangible therefor matters immensely. In emerging from the chaos of war, societies often aspire to create order. With regard to cultural heritage, this can translate into policies that often lie between two extremes, that of "tabula rasa," of clearing the ruins and starting anew, or that of trying to restore and recover what has been lost. Neither of these options is exclusively realizable. Instead, post-conflict reconstruction processes combine what often seems to be contradicting aspirations. On the one hand, they contain projects

to build a new landscape of monuments and symbolic markers that will reflect the emerging society, and they take advantage of some of the destruction to modernize urban plans and infrastructures. On the other hand, there is an affective drive to recover some of what has been lost, to retrieve it, and to recover the roots of society by looking to its past and selecting key defining moments to carry forth into the present and the future.

Another issue in the post-conflict management of cultural heritage is that of how the conflict itself is to be remembered. This emerges in memorial processes and policies as revealed by the decisions that are made about what anniversaries to commemorate officially and what sites of traumatic events to mark with monuments. It is frequently reiterated that memorials have an aspiration to remind, so that the errors of the past are not repeated. If so, then they would have a dual mission of public recognition of loss on the one hand and peace on the other. Yet one of the trends that can be observed in the aftermath of recent armed conflicts is a competition over victimhood by which each side uses memorial gestures not only as a vehicle for mourning but also as a means of planting a sign of contention and, occasionally, provocation. This results in one-dimensional narratives of events that create a pantheon of martyrs and heroes with their associated values; the messages evoked then become those of reminding of "our" suffering at "their" hands; "we will not forget" that this context is far from having a peaceful intention.

It is important to realize that cultural heritage can be managed in such a way as to divide and exclude as much as to unite and include. This is not only true in a context of armed conflict, but these extreme moments do make such uses more explicit. Cultural heritage can be a richly textured tool to engage in bringing a variety of groups together, discuss, share stories, and collaborate in activities that will help define them as a community. Achieving access to and education about this heritage is essential, for without them there will be no sense of individual and group "ownership" of cultural heritage and it is precisely that alienation ultimately fuels destruction both inside and outside the context of armed conflicts.

The destruction in Syria spurred the creation of several funds dedicated to the protection of cultural heritage during armed conflicts, a Cultural Protection Fund was created in the UK and endowed with 30 million pounds, and a Safeguarding Endangered Cultural Heritage conference jointly organized by France and the United Arab Emirates in 2016 aimed to endow it with a $100 million fund in a UNESCO-backed International Alliance for the Protection of Heritage in Conflict Areas (ALIPH).

One weakness inherent in the existing legal instruments is that they legislate for the protection of cultural *property.* The broader concept of cultural *heritage*, while gleaning affirmative strength from the relative concreteness of the first term, is far more complex and is overlooked due to the emphasis placed on the physical property aspect of the problem. Encouragingly a nascent, and as yet somewhat timid, trend can be observed in organizations taking up the use of the broader term "cultural heritage." One recent instance of this is the Reparations Order issued by the International Criminal Court (ICC) on 17 July 2017 in the case of *The Prosecutor v. Ahmad Al Faqi Al Mahdi* that reads:

> The Chamber highlighted the importance of cultural heritage and stressed that, because of their purpose and symbolism, most cultural property and cultural heritage are unique and of sentimental value. Their destruction thus carries a message of terror and helplessness; destroys part of humanity's shared memory and collective consciousness, and renders humanity unable to transmit its values and knowledge to future generations. (ICC 2017 Press Release ICC-CPI-20170817-PR1329)

Language use aside, these reparations set an important precedent in the management of cultural heritage in the aftermath of armed conflict. The Court identified and ordered reparations for three different categories of harm: damage to the attacked historic and religious buildings, consequential economic loss, and moral harm. One challenge for the Court is determining who the victims of this destruction are and what is the nature of the harm done. Another challenge is that for the last category, moral harm, the envisioned reparations involve symbolic measures such as memorialization, commemoration,

and ceremony, yet these approaches are largely informed by Western notions of mourning and repair, whereas not all victims of cultural destruction will want to be signaled out nor have their loss marked through museum exhibitions or granite monuments.

Future Directions

An important development in recent years has been the integration of cultural heritage management into peacekeeping operations, notably by the United Nations Department of Peacekeeping Operations (UNDPKO) and via the Security Council's Resolution 2100 (2013) that included cultural heritage protection as a mandate of the mission in Mali (MINUSMA). On 27 April 2015, Irina Bokova, Director General of UNESCO, declared in a meeting of the UN Security Council: "Culture stands on the front-line of conflict – it should be at the front-line of peacebuilding" (UNESCO 2015), and on the 9th of June 2016, European Union High Representative for External Relations Federica Mogherini commented that "Promoting heritage is not for archaeologists only — it is a peace imperative" (UNESCO 2016). Leaving aside the semantic slippage present throughout the official rhetoric by which culture and heritage are often used as synonyms, we are observing an interesting moment in which an attempt is being made to explicitly integrate cultural heritage into international peacebuilding and peacekeeping activities in a more concrete way than has been the case until now.

To improve current protection measures, three areas of cultural heritage management require improvement (see Curtis 2011: 56–75). First, it would be important for more states to ratify the Hague Convention and for the Blue Shield to become a more substantial institution. As key countries move to ratify the convention and, significantly, its protocols, this will become more practicable. Second, consultation mechanisms between government and military authorities on the one hand and heritage experts on the other need to be established in order that consultation can be constant – occurring before, during, and after conflicts – and are not just sporadic responses to emergency situations. This is already underway, and a series of regular meetings, conferences, and training workshops that bridge the two areas have been running for the past few years. Finally, more collaboration is required across the board to develop thorough appreciations of the circumstances that lead to the destruction of cultural heritage; this means linking research, policy, and practice but also a concerted effort to further our understanding of heritage values and valuation.

In order to support the two final areas of action, one future direction suggested here would be to combine quantitative and qualitative research in order to develop indicators relating to the wartime destruction of cultural heritage. This could help develop interventions at the various conflict stages: predicting the outbreak of conflict, its location, targets, and "tone," informing mitigation strategies that might allow preventive protective actions to be more effective than they have been to date, and gathering data on the destruction (its sustained and expansive nature when it is such) to use as evidence in trials that seek to attribute criminal responsibility and to generate reparations frameworks.

In addition to the need for deepening our understanding of these processes, there are three more avenues that require further exploration. The first is the imperative of developing a greater critical awareness of exactly when cultural heritage is being instrumentalized symbolically and rhetorically at different stages in armed conflicts – run-up, fighting, negotiations, and post-conflict reconstruction. The second is the need to fully appreciate the implications of the realization that armed conflict not only destroys cultural heritage, but it also has deep transformative effects on it as sites are interfered with and reinterpreted or become the location of critical events in the fighting. Guernica, Coventry, Dresden, and Hiroshima are but a few examples; all of these cities became signifiers for new sets of meanings after their respective bombings. Armed conflict thus also creates and adds to the heritagescape. The third avenue is that of reparations discussed above.

In sum, a great deal of work remains to be carried out in this field, but it is encouraging to

examine an overview of efforts made thus far and evaluate the extent to which legislation and awareness have evolved in the field (O'Keefe 2006: 1–3). The challenge remains to match approaches to the management of cultural heritage during conflict with the ever-expanding appreciation of what constitutes cultural heritage.

Cultural Heritage Management and Gender

Phyllis Mauch Messenger
Institute for Advanced Study, University of Minnesota, Minneapolis, MN, USA

Introduction

Since the seminal article by Conkey and Spector in 1984, calling for an archaeology of gender, the theory and literature on archaeology and gender have developed rapidly through the work of many authors, including Gero and Conkey (1991), Claassen (1994), Wright (1996), Pyburn (2004), Nelson (2006), Hamilton et al. (2007), Bolger (2010), and others. Writing and theorizing that focuses explicitly on the intersection of gender and cultural heritage management, however, is not yet as well-articulated and is often expressed indirectly in terms of diversity, multivocality, egalitarian methodology, and community participation, all themes that figure prominently in discussions of gender and archaeology.

Definition

Cultural heritage management (CHM, also called "cultural resource management," "heritage stewardship," or "archaeological resource management") is the process of undertaking activities to "care for such heritage assets as heritage places, sites, artefacts, cultural property, and other tangible heritage items in a society," according to Lee et al. (2007: 1). In assessing the maturity of heritage conservation in countries around the world, these authors note that "while CHM is a global phenomenon, its practitioners have no real sense of being a part of it." Instead, they say, many practitioners (called variously "cultural resource managers," "preservationists," or "historic building conservationists") focus on disciplinary and thematic issues, while wrestling with similar sets of issues related to management and stakeholder issues, including creating definitions and shared understandings of heritage. Some key issues that surface in the way cultural heritage assets are described in CHM literature are power, quality of life, specialist knowledge, community involvement, and a pluralistic narrative approach. As CHM practices evolve, according to Lee et al., a wide array of stakeholders emerges, and more attention is paid to community interests and consultations, to the point of considering community members "as legitimate managers and co-managers of assets" with a "goal of achieving a consensus approach to management" (pp. 13–4).

Gender, according to Sørenson (2000: 52),

> is best understood as a set of values that assign gendered meaning to behaviour and affect that behaviour. Through such meaning, culturally specific notions of femininity and masculinity. . .are constructed.

Moreover, "engendered individuals are social agents and their actions form society" (p. 8). At

the same time, she argues, we should not lose sight of the distinctions between "gender identity and gender ideology" that contribute to our understanding of the "interaction between self and society which lies behind normative behaviour." Sørenson discusses the importance of gender as a necessary part of theorizing about social relations, especially in archaeology, and the need for further analysis of gender "as a social construct that uses materiality" (p. 11) and "about how society relates to and constructs cultural categories from the differences that always exist amongst its members" (p. 72). These categories of gender identities and relations of past and present societies are of particular interest and relevance to archaeologists and heritage managers in a variety of ways, as discussed below.

Historical Background

While the origins of heritage management are not the subject of this entry, it is worth noting that, until quite recently, there has been a strong bias toward preserving, interpreting, and managing sites and events generally considered to have a masculine connotation. For example, in the United States, cultural resource management has its roots in historic preservation, which was based on efforts to commemorate the American Revolution and the Civil War and men "(and they were largely men)" who were the heroes of those and other wars (Davis 2010: 188). A century of legislation related to preservation, including laws designed to include Native American tribes and local governments and citizens in decision making, has slowly moved the pendulum toward more inclusive representations of whose heritage is being preserved.

The development of feminist theory and the role of gender in archaeology, gender in postcolonial and postprocessual archaeologies, and the relationship of cultural practices and gender have been discussed by many authors, including Claassen (1994), Gero (1996), Wright (1996), Nelson (1997), Kehoe and Emmerichs (1999), Hamilton et al. (2007), and Ströbeck (2010). Gero discusses the gendered nature of what is considered acceptable fieldwork techniques and argues that "the organization of gendered personnel in the field insinuates itself in the creation of archaeological fact" (1996: 250). Ströbeck (2010) summarizes the trajectory of feminist theory and gender issues in archaeology, particularly in relation to indigenous communities, and makes connections to choices that are made today. She argues that feminist work has revealed inherent gender biases in archaeological work, showing how feminist perspectives in archaeology have been marginalized (2010: 331–2). Furthermore, these biases have been reflected in heritage management, and challenges have been made to counteract androcentric constructions of the past, which in past decades would have been presented as uncontested truth in interpretations of the past at heritage sites and codified through decisions related to heritage management. Instead, according to Ströbeck (2010), Franklin and Paynter (2002), Jackson and Smith (2005), and Robles García and Corbett (2010), among others, relationships between colonists and colonized/indigenous subjects are being reframed at the intersections of race, class, and gender.

Key Issues

Examples from archaeological practice, discussed here and elsewhere, use similar sets of descriptors to discuss issues related to gender, whether it be research, fieldwork, or public engagement. This language describing aspects of communication and professional practice also applies to heritage management more broadly and can help us understand the relationship between cultural heritage management and gender.

Gero (1996: 275) discusses the gendered aspects of archaeological practice, including work relationships, divisions of labor, and specializations. She argues that values of the scholarly community are reflected in how and what work is carried out, providing a case study of how cultural politics work on the ground. She argues for a theorizing of gender that crosscuts race and class in order "to recognize and embrace a wide range of cognitive styles." Wright (1996: 15) notes that many authors who address gender issues illustrate an "open-ended and relational style of discourse

that promotes productive and fruitful exchange." These authors do not suggest that these styles of discourse "are possessed exclusively by females," she says, but that "feminist pedagogy argues against built-in, innate, natural states of gender constructs."

Democratizing strategies help to validate diverse ways of knowing the past and expand the voices heard in interpretation and management strategies. Franklin and Paynter (2010: 111–2), for example, discuss how feminist archaeologists use multivocality, multilinear narratives, and active engagement and collaboration to decenter archaeologists' knowledge claims and open space for community-based management frameworks. At the same time, they argue that "we can't compartmentalize gender inequality in the profession and theorizing about gender in the past as if they are separate projects." Hamilton (2007: 143) describes archaeology as still largely "a 'macho' craft", which "continues to pertain even while archaeological theory and practice have moved on to issues of reflexivity, multiplicity, and subjectivity, alongside considerations of the creative nature of fieldwork and its contribution to the building of knowledge." She calls for a "greater recognition and incorporation of female-gendered practice and approaches" in order to keep the craft dynamic and enrich the way forward.

Gender is reflected in research questions, fieldwork strategies, and interpretation of data, as discussed by numerous authors, including Dobres (2006), Nelson (2006: 1–27), and Smith and O'Donnell (2007). The gender of field researchers shapes the kinds of questions asked, who their informants are, and even what is considered to be important information. According to Jackson and Smith (2005: 337–8), many scholarly discussions about informants in field-based research fail to "recognize the intrinsic power that individuals and social structures within the research community may have over the choice of colleagues." Describing their own experiences in Australia, they suggest that "the areas of interest of individual researchers and their specific position in society (in terms of age, gender, marital status) predetermine them to work with individuals of comparable interests and status" which is helped along by informants steering researchers to "the appropriate people with whom we might/should work." The categories of data gathered, the networks developed, and the resulting interpretations also affect management decisions, and the role and influence of gender, age, and other variables should be acknowledged and taken into account. As Jackson and Smith describe it,

> This means that different data sets and different archaeological stories can be produced from the same community at the same time, according to the specific social relationships of individual researchers (p. 339).

According to Robles García and Corbett (2010: 115), the contemporary framework of archaeological resource management implies managing in multiple ways, including education as well as protecting, studying, and "conserving elements of heritage in socially defined contexts." They discuss the challenges of moving away from traditional styles of thinking and action, which may be top-down, authoritarian, and not allowing for flexible, participatory self-management. They describe the management plan for Monte Albán in Mexico as an alternative within the national plan, protecting the "social integrity of the archaeological site," while creating a "horizontal network among a complex array of social actors" (p. 118). The plan builds relations with local communities and stakeholders using a collaborative, sociological framework and a discourse "more sensitive to conservation, problem solving, and flexibility" (p. 120).

A discussion of CHM and gender must also address issues of gender inequity in education, research, and employment opportunities. The number of women in archaeology and related fields has steadily increased in the last 30 years, yet many disparities still persist. A special report to the Society for American Archaeology on the status of women in archaeology (Rizvi and Berg 2008) describes significant improvements in many areas affecting women and families but also cautions that progress still needs to be made to reach full gender equity. According to Altschul and Patterson (2010: 306), "The shape of the discipline in the academy still reflects

demographic trends set in motion in the 1940s". For example, the practice of steering female archaeologists away from fieldwork and into museums and labs, which persisted into the last decades of the twentieth century, is discussed by the authors in Classen (1994), Kehoe and Emmerichs (1999), and other biographers of women in the field. Smith and O'Donnell (2007) discuss the pattern that persists in Australian universities of greater numbers of women in research positions than in professorships. Franklin and Paynter (2010: 113) summarize key sources for discussion of gender disparities in employment and placement, citation practices, the marginalization of gender and feminist theory, training of studies, and other practices.

Future Directions

Debates about feminist theories in archaeology and their relationship to processual, post-processual, and postcolonial archaeology continue today and will no doubt expand to more fully encompass cultural heritage management and its diverse sets of stakeholders. These debates and scholarly work in this area will contribute to our understanding of the role of gender in heritage management; a theory of cultural heritage management and gender should be more thoroughly developed. A welcome contribution to the literature in this area would be case studies that show the impact of gender considerations on heritage management programs and policies. Similarly, more study of social identity formation at the crossroads of race, class, and gender and its relationship to issues in cultural heritage management should be carried out.

Cultural Heritage Management and Images of the Past

Ian Alden Russell
David Winton Bell Gallery, Brown University, Providence, RI, USA

Introduction

There are many sensory experiences that mingle as we apprehend and interpret our world, but one sense, sight, enjoys prominence in the documentation and mediation of the past. The power of sight and of viewing images does not lie in an inherent dominance of the sense of sight over any other senses. Rather, as John Berger (1972) argued in *Ways of Seeing*, sight and seeing is the earliest communicative medium in human development. It comes before words, and thus, it has a fundamental role in the understanding of our orientation to the world around us.

For the study of the past, sight has long been a sense by which knowledge was discerned, interpreted, and shared. For example, the recording of sites and monuments by the second century CE Greek writer Pausanias were founded upon the use of sight and seeing to correctly identify places, sites, and buildings and orient oneself in the world. At the outset of Book 1 of his *Description of Greece*, Pausanias (1918) begins what will be a recurring method of using sight to orient the reader towards places being described.

> On the Greek mainland facing the Cyclades Islands and the Aegean Sea the Sunium promontory stands

> out from the Attic land. When you have rounded the promontory you see a harbor and a temple to Athena of Sunium on the peak of the promontory (*Description of Greece* 1.1.1).

Pausanias' writings have a professed intention to orient people visually to the appearance of the world. This is a tradition of writing that continues today in the genre of travel writing, but it is Pausanias's visual descriptions that are of particular relevance to a consideration of archaeology and cultural heritage. They form a clear effort to share a visualization of place over time – an image of the past.

Key Issues

The Antiquarian Image

The value of the image of the past, as was apprehended by Pausanias as well as by artists and antiquarians throughout the centuries, is its mobility. Whether recorded in narrative, drawing, or painting, the image of the past allowed for the transportation and communication of visual experiences of places and sites both over distances and over time. Following in the geographic tradition of Pausanias, William Martin Leake (1777–1860), a geographer for the British military in Greece, pioneered the use of ancient texts to make connections to contemporary geography (see Witmore 2004). Leake is credited with being one of the earliest antiquarians to utilize advanced surveying techniques in order to fix the "images of the past" from these ancient sources in order to generate more precise and quantifiable images of the ancient landscape.

With the advent of the printed book and printmaking, the image of the past gained an additional value. Modern antiquarian studies advanced some of the earliest extensive use of printed illustrations as part of their texts. Antiquarian texts, such as Thomas Wright's *Louthiana* (1758), utilized abstracted schematic drawings of sites and places such as earthworks to create sets of images that could be used for comparative analysis of form and method of construction. For the first time, visualizations of structures, sites, and places separated by great distances could be compared alongside each other, and these comparisons could be printed and shared widely throughout the world through the libraries of learned societies.

The proto-scientific value of these illustrations and visualizations of the past quickly led to the incorporation of image making as a central aspect of antiquarian practice. In the nineteenth century, these efforts became part of broad efforts to survey and codify the state and condition of extant ancient sites throughout the landscapes of Europe. For example in Ireland, artist and antiquarian George Victor Du Noyer (1817–1869) was employed as part of the Irish Ordnance Survey to produce drawings and watercolors of sites being recorded as part of the vast cartographic endeavor. Du Noyer's drawings and watercolors formed a critical component of the survey, but given his reputation as an artist in his own right, they were also appreciated aesthetically as art. Similarly the so-called father of Irish archaeology, George Petrie (1790–1866), who also worked as part of the Ordnance Survey, was a famed painter. His subject was often Romantic views of the Irish landscape. Beyond his painting and his leadership of the antiquities committee of the Royal Irish Academy, he contributed illustrations to many of the earliest tourist guide books to the Irish countryside.

This situation illustrates a fundamental tension in the relationship of the image of the past to archaeological and heritage work. On the one hand, images and technologies of image making were adopted as a means of documenting faithful representations of sites, structures, artifacts, and places. However, Du Noyer's drawings and Petrie's paintings and illustrations, like other antiquarians illustrations of their time, were their own artistic interpretations of their visual encounters. They were their own images, but they were consumed simultaneously by burgeoning archaeological science as objective representations and by the wider public as subjective interpretations.

The Archaeological Image

As the discipline of archaeology was established at the end of the nineteenth century, a rift grew between objective and subjective appreciations of images of the past. The development of the discipline relied on the ability of practitioners to

visually observe and objectively document the changing colors of soil deposits, recognize the stylistic and compositional similarities between artifacts and sites, and visualize the architectural form of buildings long since destroyed. In order to render a visual archaeological record to sustain the objective comparative analysis required by the nascent science, the drawing and visualization of the objects and sites of the past became a fundamental part of the skill set of a professional archaeologist. Archaeological students were trained in the practice of technical drawing as a means of rendering objective, scientific documentations of objects, structures, and sites, and over the twentieth century, as new methods and technologies of visualization presented themselves (such as photography), they were incorporated as extensions of the endeavor to render an objective, visual archaeological record of the past. Especially after the acceptance of positivism as a central epistemological orientation for the discipline in the mid-twentieth century, archaeologists pursued and incorporated these image-making tools (e.g., laser scanning) as progressive steps in the endeavor to truthfully represent the exact condition of the traces of the past for the purpose of documentation and preservation.

Parallel to this growth in visual positivism, there remained, however, a steady use of illustration for the purposes of communicating the image of the past to the wider public. Archaeological illustrators were commissioned by archaeologists to respond to data and narrative interpretations of data to create artistic interpretations of objects, structures, places, and at times, whole communities and societies (e.g., the Greek and Roman archaeological illustrator Peter Connolly). Continuing in the somewhat more subjective or interpretive aspect of antiquarian images, these illustrations facilitated the imagining of the past through the enjoyment of a skilled artist's interpretation of objective archaeological science.

The Representation of Heritage

Eighteenth- and nineteenth-century antiquarianism and early archaeological science significantly impacted the representation of heritage in the modern era. Images of the past being produced by antiquarians and prehistorians received increasingly wider audiences as their images and illustrations began to be consumed by wider society as representations of burgeoning national identities. A growing interest and concern over the representation of distinct and glorious national identities spread throughout Europe as more and more unique "ancient" objects and sites were "discovered," documented, and illustrated. In some countries, archaeological objects themselves became nationalistic symbols. For example, the membership card of the National Repeal Association in Ireland (a political group determined to repeal the Act of Union between Ireland and Great Britain) featured images of many artifact types that were being discovered throughout Ireland – socketed axes, Bronze Age shields, medieval brooches, and Iron Age torcs. These appropriations of images of the past for the purpose of distinct, unique, indigenous national and cultural symbols that established a tradition of cultural representation were not restricted to Europe and expanded and persisted throughout the twentieth century to our contemporary moment. Extreme examples from the twentieth century include the use of archaeological research, distribution maps, and design motifs derived from Germanic runes and pottery by the national socialist regime in Germany in the 1930s and 1940s to articulate and represent a distinct ethno-nationalist identity. A more common example would be the use of archaeological objects and ancient sites on currency and coinage by nations throughout the globe as a way of expressing unique visual identities. The significance of this for cultural heritage work is that these national cultural identities in many respects have become the primary product and experience that is marketed by states as part of tourism and development initiatives. Thus, the objects and sites with which we work are often charged with social and cultural expectation to be materializations and representations of core national identities which may limit the possibilities for subjective reinterpretations and, in the extreme, displace subaltern and minority identities, articulating a singular representation rather than allowing for diverse and multivocal images of the past.

Current Debates

The Image of the Past as Popular Culture

The image of the past has tremendous power and value in modern society. Heritage and archaeology are not simply academic pursuits but are also important parts of popular culture (see Holtorf 2002). As the popularity of cultural tourism has grown in the later half of the twentieth century, so too has interest in cultural heritage. Cultivating and stewarding interest in the past and promoting a broad "archaeo-appeal" of various experiences, heritage practitioners are both the initiators and the subjects of creative mediations of the data and experience of the past in the modern world. Beyond the enjoyment of heritage sites and museum exhibitions as touristic experiences, cultural heritage and also archaeology have been themes in popular media and entertainment in the twentieth century. For example, the cinematic image of the past has been a source of creative collaboration for archaeologists and historians with filmmakers either hoping to recreate plausible scenarios for dramatic narratives or dramatizing the character of the archaeologist or historian themselves (e.g., Indiana Jones) (see Schablintsky 2007). In the first decade of the twenty-first century, the use of the cinematic image of the past has expanded beyond the cinema. With the boom of "reality" television, historical enthusiasts, historians, archaeologists, and heritage professionals have seized the new genre as an opportunity to move beyond the objects of archaeological and historical enquiry and mediate the experience of discovery itself (e.g., Time Team) (see Piccini 2010). Not always an altruistic act, the presentation of the past within modern media is also a means to brand, market, and sell the past (and identities associated with it) to modern society, with many stakeholders from small businesses to national tourism industries (see Holtorf 2007). As part of the expanding marketplace of identities, images of the past rendered through cultural heritage provide potent visual identities for the experiences and products being marketed to people throughout the globe.

New and Emerging Media

Responding to technological progress, there has also been an increasing use of digital and web-based technologies to render visualizations and visual experiences of the past. In the early part of the twenty-first century, scholars at University of California, Berkeley, and Stanford University (i.e., the Metamedia Lab) established substantive initiatives to explore and interrogate the role of digital media in the visualization of archaeology. Of particular note is Ruth Tringham's work with students and colleagues to apply multimedia to the interpretation of the site of Çatalhöyük in Turkey. In 2007, they began the use of the online, three-dimensional social media site Second Life (secondlife.com) as a tool for interpreting and sharing a virtual visual experience of the site. A major step in the engagement of new and emerging multimedia (digital, visual, and social) for the experience of the image of the past, it can be seen to be within a tradition of digital illustration simultaneously being developed and adopted by more traditional archaeological illustrators.

Engaging these emerging trends, the recent Visualisation in Archaeology project undertaken at the University of Southampton (viarch.org.uk) was an important effort to discuss the history of and the contemporary role of visualization in archaeological practice. Bringing together archaeologists, artists, illustrators, and art historians, the project followed on from important work by scholars such as Brian L. Molyneaux (*The Cultural Life of Images* (1997)) and Stephanie Moser and Sam Smiles (*Envisioning the Past* (2005)) in opening up a critical discussion into the ways human beings view archaeology and view objects which they interpret as having archaeological authority. These scholarly efforts also mark an important step in reflexively critiquing not only the role of the image in archaeological practice but also the exhibition of archaeological materials.

Future Directions

Recently, there has also been a move towards a deeper engagement between archaeological image making and the discourses of art history

and contemporary art practice. Broadly dissatisfied with the approach to the image as a purely objective representation of the past, scholars and practitioners such as Colin Renfrew (1999, 2005 also see Renfrew et al. 2004), Michael Shanks (1991; also see Shanks and Pearson 2001), or Doug Bailey (2005, 2008) have undertaken substantive endeavors to sustain critical, interdisciplinary initiatives in the exploration of the image of the past through both archaeological and artistic practices. Their work is inspiring shifts in the next generation of archaeological thinkers and practitioners challenging the objective representational image of archaeological practice (e.g., Cochrane and Russell 2007). What is resulting is a diverse range of projects ranging from artist-in-residence projects at archaeological sites (e.g., the Stonehenge Riverside Project) to curatorial projects such as the *Ábhar agus Meon* exhibition series from the Sixth World Archaeological Congress to *avant-garde* practices by artist-archaeologists such as Fotis Ifantidis, Michael Jasmin, or Christine Finn.

Another important shift in more recent archaeological and heritage work is balancing the sense of sight by exploring other senses' ability to explore the past. Work by scholar-practitioners such as Aaron Watson (2006) on archaeoacoustics highlights the possibility of sound and of hearing to reveal compelling archaeological interpretations of sites. Similarly, new research is currently being undertaken in Istanbul, Turkey, by scholars at Koç University engaging with artist and smell expert Sissel Tolaas on an exploration of the role of smell in the understanding of the past and heritage of the city. These initiatives are part of a widening effort within archaeology and heritage practice to have a more holistic approach to human experience, apprehension, and interpretation of the past. Building on the long tradition of creating images of the past, these new modes of archaeological practice are a reminder that the image of the past is not fixed but is a continually renewed expression of how humans see the world, interpret it, and imagine its meanings.

Cultural Heritage Management and Maritime Law

Craig Forrest
Marine and Shipping Law Unit, TC Beirne School of Law, University of Queensland, Brisbane, QLD, Australia

Introduction

The management of submerged cultural heritage is not only difficult because of the nature of the marine environment but especially so because this environment is subject to a very different regulatory regime to that applicable on land. It is subject to "maritime law." This potentially impacts on every aspect of cultural heritage management the further out to sea the heritage lies.

Definition

In a very broad sense, "maritime law" is composed of two separate bodies of law: admiralty law (largely of a private law nature) and the law of the sea (public law). These bodies of law, together with a third body of law – cultural heritage law – intersect and potentially apply to cultural heritage that lies below the low-water mark. All three of these bodies of law are underpinned by an international law framework, though this is interpreted, implemented, and supplemented by differing national perspectives, making the management of underwater cultural heritage particularly challenging. While each country has a unique regulatory regime, common, though debated, themes exist.

Historical Background

The law of the sea developed through customary use over many years to a point when, in 1958, it was codified in four separate international conventions: the Convention on the Territorial Sea and the Contiguous Zone, the Convention on the Continental Shelf, the Convention on the High Seas, and the Convention on Fishing and Conservation of Living Resources of the High Seas. With a changed international sociopolitical context together with rapidly changing technology that allowed access to the depths of the oceans, a new convention was adopted in 1984 (coming into force in 1996), which replaced these earlier conventions: the UN Convention on the Law of the Sea (UNCLOS). Not all countries, however, are party to UNCLOS, and the earlier conventions may still apply to some countries, though this is now only a very few. The conventions are supplemented by the customary international law of the sea, being rules of law derived from the consistent legal conduct of countries. To a large extent, UNCLOS codified the customary international law, and while it continues to develop, it effectively embodies the contemporary international law that governs the sea.

UNCLOS is often described as the "constitution of the oceans," and its most important function is to allocate rights and duties to countries through the creation of six maritime zones: internal waters, the territorial sea, the contiguous zone, the exclusive economic zone, the continental

shelf, and the Area (high seas and deep seabed). Within these zones, a balance is struck between the interests of the coastal countries and those of other countries, especially with "maritime countries," being those with significant investment in the world's merchant fleet through ownership, ship registration, or shipping logistics, such as Panama, Greece, Denmark, the United States, Korea, China, Japan, and Singapore. As each zone is situated further away from the coast, the interests of the coastal country wane and give way to the interests of maritime countries and the broader international community. The ability of any country to manage cultural heritage in each of these zones is therefore dependent on what rights and duties apply in each zone coupled with the coastal country's implementation of those rights and duties in its national laws.

While the international law of the sea defines the rights and duties of countries, a body of admiralty law has developed which regulates the conduct between individuals that relate to ships and shipping. It addresses, for example, issues relating to liability for collisions between vessels, liability for pollution and other hazards emanating from ships, and rewarding those that have saved ships and their cargo from the perils of the sea. Since much of the underwater cultural heritage is sunken ships, this admiralty law may play an important part in determining the regulatory and protective environment for this heritage. While underpinned by international customary law and a number of international conventions which seek uniformity across countries' laws, this admiralty law is essentially that of each country, applying to the maritime zones over which it exercises jurisdiction, as well as to its nationals and to those ships that are registered there and said to fly that country's flag.

This maritime law, as the law of the sea and admiralty law, when applied to underwater cultural heritage, necessarily imports a third newer body of international law: cultural heritage law. This cultural heritage law is an emerging area of international law underpinned by a number of international conventions adopted under the auspices of the United Nations Educational, Scientific and Cultural Organization (UNESCO), including the Convention for the Protection of the World Cultural and Natural Heritage, the Convention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Ownership of Cultural Property, and the Convention on the Protection of the Underwater Cultural Heritage. Fundamentally, these conventions attempt to structure a regulatory regime which "protects" cultural heritage by ensuring its physical integrity, recognizing its social context, and emphasizing its contextual importance.

Key Issues

The management of underwater cultural heritage is entirely dependent on the regulatory regime of each coastal country and, depending on its constitutional structure, possibly sub-entities, such as provinces, states, territories, etc. However, the scope of this regulatory regime is dependent on the rights and duties the coastal country has in accordance with the law of the sea as set out in UNCLOS. When UNCLOS was negotiated, underwater cultural heritage was not particularly high in the order of priorities and therefore did not receive the consideration that was necessary to establish a strong protective regime in any of the maritime zones. Furthermore, a number of issues were left open for differing interpretation and country implementation. These legal problems are compounded in their practical application by the fact that, while most underwater cultural heritage lies in internal waters and territorial sea, advancement in diving technology has opened up the other maritime zones to exploration and exploitation. An appreciation for the possible scope of the coastal country's jurisdiction and the geographical extent of each zone becomes the essential framework for the management of the underwater cultural heritage.

Since UNCLOS applies where the land ends and the sea begins, it is from this point that each maritime zone is measured. This is never constant given the ebb and flow of the tide and which is exasperated by the fact that coastlines are not uniform and usually indented by bays, estuaries, ports, and rivers and may have numerous islands

close to the mainland. The solution provided in UNCLOS is for each country to measure this "baseline" at the low-water mark and have this represented on appropriate nautical charts. Exactly how this is done is left to each country. Some may use the lowest astronomical tide, while others might use a nominal point which might exist some way out to sea given changing sea levels and shifting coastlines. The baseline does not necessarily always follow the low-water mark around the coast and may be drawn across river mouths, bays, and harbors and along islands or sandbanks that appear at low tide. The baseline does not, therefore, necessarily reflect its geographical descriptor.

The maritime zones in which the coastal country has absolute sovereignty are its internal waters, and refer to those waters which lie on the landward side of the baseline, and usually include waters in harbors, ports, bays, and tidal rivers or between islands lying close to the shore and the mainland. As a sovereign country, the coastal country can regulate all activities in this zone as if those waters were land.

The sovereignty of a coastal country extends, beyond its internal waters to an adjacent belt of sea measuring up to 12 nautical miles from the baseline, described as the territorial sea. This sovereignty is subject to the convention, which provides for the innocent passage of foreign ships through this zone. Any activity directed at cultural heritage in the territorial sea would not, however, constitute innocent passage, and the coastal country has the exclusive right to enact laws that regulate such activity and protect cultural heritage in that zone. Indeed, most countries have legislation that regulates activities in the territorial sea, many of which also include the regulation of shipwrecks and underwater cultural heritage, such as the United States' Abandoned Shipwrecks Act, the United Kingdom's Protection of Wrecks Act, and Australia's Historic Shipwrecks Act. Naturally, the vast majority of submerged cultural heritage sites are likely to lie close to the land and within the territorial sea and include such important sites as the sunken city of Port Royal, underwater Alexandria, and the submerged temples of Mahabalipuram, as well as important shipwrecks such as the Bronze Age wrecks of Cape Gelidonya and Uluburun, *Batavia*, *La Belle*, *Lusitania*, and the *San Juan de Pasajes*.

Beyond the territorial sea, the jurisdictional capacity of the coastal country is less clear and subject to some international disagreement. This is particularly the case in relation to the exact jurisdictional capacity of the coastal country in the contiguous zone. This zone is an area adjacent to the territorial sea, measured 24 nautical miles from the baseline, in which the coastal country has limited control to prevent or punish infringements of its custom, fiscal, sanitary, or immigration laws. A number of countries, including Australia, Brazil, Canada, China, Denmark, Greece, Ireland, the Netherlands, and the United States, extended their national legislation to take into account underwater cultural heritage in this zone.

Whether the coastal country has any jurisdiction over underwater cultural heritage on the continental shelf is also subject to disagreement. The continental shelf extends from the shallows of the territorial seas down to the deep seabed and may extend up to 350 nautical miles from the baseline. Each coastal country is given the exclusive right to explore and exploit the natural resources of this zone, which includes mineral, gas, and oil resources as well as the living resources of the seabed such as lobsters, crabs, etc. Underwater cultural heritage was not, however, included in the definition of "natural resources," though UNCLOS requires countries to "protect objects of an archaeological and historical nature found at sea and shall co-operate for this purpose." A number of countries have interpreted this as allowing for an extension of their jurisdiction so as to regulate underwater cultural heritage on their continental shelves. These include Australia, Ireland, Seychelles, Cyprus, Spain, Portugal, Norway, and China. These are contentious claims, and while other countries, such as the United States, have indicated a contrary interpretation, no formal objection has been made to these possible extensions of jurisdiction. Coextensive up to 200 nautical miles of the continental shelf is the exclusive economic zone, in which the coastal state has the right to exploit the living resources of the seabed and water column, most importantly

fish. Like the continental shelf, UNCLOS failed to set out a clear regulatory regime for underwater cultural heritage in the exclusive economic zone. Heritage such as the wreck of the *RMS Titanic*, which lies on the continental shelf of Canada, is not therefore well regulated by UNCLOS.

A further complication in both the continental shelf and exclusive economic zone is the contextual relationship between the underwater cultural heritage and the marine environment. In these zones, the coastal country has rights with respect to the marine environment and its natural resources. Cultural heritage, such as historic shipwrecks, may quickly become part of the marine environment, through the concretization of marine flora and use by marine fauna, and subject to coastal country environmental protection regimes (such as the wreck of the *USS Monitor* on the continental shelf of the United States). This invokes the considerable body of international and national environmental law, compounding the complexity of the regulatory regime.

Beyond the continental shelf lies the Area (high seas and deep seabed), in which countries have the right to search for, survey, and excavate underwater cultural heritage and can authorize their nationals and vessels flying their flag to do so. While UNCLOS urges countries to protect underwater cultural heritage in this zone, the provision is too vague and imprecise to provide a basis for any regulatory regime.

While the extent of the coastal country's jurisdiction beyond the territorial sea is debatable, and therefore impacts on its ability to regulate activities by foreign-registered ships and nationals, it does not hinder the ability of the country to regulate its own nationals and registered ships. A country can therefore adopt laws regulating the conduct of its registered ships and nationals in any international maritime zone, including in relation to underwater cultural heritage found in that zone. The agreement between France, the United Kingdom, Canada, and the United Countries in relation to the activities directed at the *RMS Titanic*, for example, is based upon this jurisdictional capacity.

Within this jurisdictional context, countries may regulate underwater cultural heritage. It is here that cultural heritage law principles and admiralty law principles intersect. This intersection is fraught with tension as the two bodies of law are underpinned by fundamentally different principles. Cultural heritage law is fundamentally of a public law nature, seeking to preserve and protect the physical manifestations of our past for the benefit of society as a whole. This, for example, ensures that through the science of archaeology, pictures of past cultures and societies and their ways of life can be constructed through interpretation of scientifically gathered evidence. Increasingly, this protection of underwater cultural heritage is achieved while preserving the cultural heritage in situ. This body of law is underpinned by notions of collective interests, preservation, and non-commercialization.

Admiralty law, on the other hand, is fundamentally of a private law nature, regulating the manner in which private individuals interact in shipping activities. An ancient principle of admiralty law, for example, is the right of a person who has saved, or salved, another's property from the dangers of the sea to a reward from the owner of that property. This salvage principle is underpinned by notions of private ownership and commerce.

Attempts to reconcile these two bodies of law with their fundamentally different principles in international law continue to be particularly difficult. The 1989 International Salvage Convention seeks to achieve uniformity in the way countries implement salvage principles and fundamentally encourages individuals to voluntarily save lives and property at sea and to return such saved property to its owner and back into the stream of commerce. This, however, may be inconsistent with notions of protection in situ where the property is, for example, a sunken ship of archaeological importance. Whether salvage principles ought to apply in such a situation was the subject of much debate during the negotiation of the Salvage Convention and required a compromise. The compromise was essentially to leave this decision to each country, allowing the country the right not to apply the convention "when the property involved is maritime cultural property of prehistoric, archaeological or historic interest and is situated on the sea-bed." While some countries

such as Australia, China, France, Norway, Netherlands, Sweden, and Spain entered such a reservation, the majority of countries have not. That does not however necessarily mean that these countries apply salvage law to underwater cultural heritage as, despite not entering a reservation to the convention, they may nevertheless not allow for the provision of salvage law in their national legal systems.

A second attempt at addressing this conflict between cultural heritage law and admiralty law was made through UNESCO with the adoption of the Convention on the Protection of the Underwater Cultural Heritage. While the convention was prompted by this conflict, and the need to ensure that any activity directed at underwater cultural heritage was undertaken in accordance with appropriate scientific methods, it also sought to address the international law of the sea uncertainties in the jurisdictional capacities of countries to regulate underwater cultural heritage beyond the territorial sea. Both objectives were controversial and required compromise. The result was the partial extension of coastal countries' rights to regulate underwater cultural heritage on the continental shelf, requiring that country to cooperate with the country or countries with which the cultural heritage as some cultural or legal connection; and a restriction on the application of salvage law to underwater cultural heritage to those instances where prior authorization for disturbance has been given by the relevant country, which is usually the coastal country. Of great significance are the rules of good archaeological practice for underwater cultural heritage that are contained in an annex to the convention. It is the application of these rules that provides protection for that heritage in each of the maritime zones.

This attempt at reconciling these two bodies of law has only been partially successful, not only because of the compromise inherent in the text but because the convention has yet to achieve broad acceptance and ratification by countries. Some countries, such as the United States and the United Kingdom, which have traditionally favored the application of salvage law to underwater cultural heritage, have failed to become a party, as have a great many developing countries that have yet to address this conflict in their waters. The countries that have ratified the convention have tended to be those that have favored a cultural heritage context to the management of the cultural heritage and have largely excluded the application of traditional admiralty law. A number have taken such an approach, including Greece, Turkey, Spain, and Portugal. Nevertheless, for many, whether a party to the convention or not, their regulatory regimes evince an attempt at reconciling these two bodies of law without completely excluding either. Usually this compromise is underpinned by a system which allows private individuals to engage with the underwater cultural heritage but within a country's regulated system. Ordinarily this is underpinned by a system of authorization such that a license is needed prior to, variously, searching for, disturbing, or excavating underwater cultural heritage. In some cases, such as the United Kingdom, elements of salvage law persist such that the private individual may benefit financially from the sale of some of the recovered heritage. In other cases, such as Australia and South Africa, while private individuals may be involved in activities directed at underwater cultural heritage, no commercialization is permitted. In a number of countries, such as China, Greece, and Turkey, only the State, and not individuals, may engage in activities directed at underwater cultural heritage. Some though, such as Indonesia, appear to do so for commercial gain.

The scope of these regulatory systems differs remarkably between countries. Some, such as the United States and United Kingdom, while largely maintaining an admiralty law system, have excluded a small number of historic wrecks from this system. Only those specifically deemed to be of importance are excluded. Many other countries take a broad approach, excluding not only historic wreck of a certain age but also underwater cultural heritage other than historic wreck, such as submerged landscapes and settlements. What qualifies as an historic wreck is also subject to a number of different approaches. In South Africa, for example, it is wreck that has been underwater for more than 50 years, in Australia, 75 years, and in Ireland, 100 years.

Whether a country's regulatory regime is fundamentally based upon admiralty principles, or embraces a publically orientated cultural heritage framework, questions of ownership of underwater cultural heritage may still persist. Notions of continuing private ownership of underwater cultural heritage, most notably sunken ships and cargo, are entirely consistent with admiralty law principles and, indeed, underpin the very basis of salvage law. While problems may arise in establishing ownership, or determining whether ownership has been lost or abandoned, either expressly or impliedly, the notion of ownership prevails, so much so that in some countries, such as the United States, a finder of abandoned property may become the owner of that property, including the property of cultural or historical importance. In most countries, however such abandoned property will vest in the State. At the other end of the spectrum, a number of countries, such as Greece, Turkey, and South Africa, vest ownership of all cultural heritage, whether abandoned or not, in the State. This vesting of ownership in the State may be problematic when a private owner exists, as it effectively becomes a form of nationalization or confiscation, invoking human rights issues.

Given that a large number of historic ships are warships, and therefore State owned, a further problem in the regulatory regime is dealing with foreign State-owned cultural heritage within maritime zones over which the coastal country exerts jurisdiction. For example, the wreck of the *CSS Alabama*, sunk in 1864 off the coast of France, was claimed by the United States, while France has claimed ownership of the *La Belle*, which sank in 1686 off the coast of Texas, United States. This is particularly problematic in the territorial sea and internal waters when the regulatory regime of the coastal country does not necessarily give effect to the ownership rights as perceived and exerted by the owning country.

Future Directions

While the law of the sea provides a basic, but opaque, framework within which individual countries may exert regulations to manage the underwater cultural heritage, it does little to encourage a uniform approach to heritage management. Admiralty law too, though capable of taking some archaeological and historical value into account when awarding salvors for the recovery of private property, is no longer the basis upon which most countries manage underwater cultural heritage, and at its core, admiralty law principles are incompatible with cultural heritage law principles. The most promising mechanism for a uniform and effective management regime for underwater cultural heritage lies in the 2001 Protection of the Underwater Cultural Heritage Convention. Having come into force in 2009, a number of countries that had abstained from voting in favor of the convention, such as Germany, have now indicated that they will ratify the convention in due course. Similarly, countries such as the United States and United Kingdom face significant internal pressure to adopt the convention or, at the very least, to adopt the annex of the convention which sets out the code for best practice for activities directed at underwater cultural heritage.

Conclusion

Given its geographical location, the management of underwater cultural heritage is at times compromised by the need to address maritime law issues. The extent to which maritime law impacts on this management is entirely dependent in the particular national legal system. The extent of this impact can only be managed globally through the development of agreed regulatory regimes such as the 2001 Convention, which brings certainty and predictability to what is increasingly an international management issue.

Cultural Heritage Management and Native Americans

Joe Watkins

Archaeological and Cultural Education Consultants, Takoma Park, MD, USA

Introduction

The involvement of Native American groups in the field of cultural/heritage resource management is in some ways antithetical to the history of the discipline in the United States. A brief review of the historic preservation movement in the United States makes it clear that early historic preservation efforts were based primarily on upper-class values applied to concepts of history practiced by nationalist-focused groups. This nationalist focus has had implications for tribal groups who often get caught up in the conflict between "anthropology" as the study of allegedly simpler people and "history" as the study of groups which have evolved into civilizations. Such a conflict is also implicit in the term "historic preservation," since it seems to focus on saving those things whose purpose was fulfilled primarily in the past. For example, when tourists visit places like New Mexico's Taos Pueblo, they see a cramped, dusty, five-story structure that Americans have come to know as a pueblo. However, they are often disappointed when they encounter the Pueblo's inhabitants operating motor vehicles while talking on a cell phone in perfect English.

Historical Background

The first piece of legislation that related to the preservation of heritage resources in the United States – the Antiquities Act of 1906 – directly impacted the Native American heritage. The law extended governmental protection to historic and prehistoric remains on public lands; it established criminal sanctions for the unauthorized destruction or appropriation of antiquities owned or controlled by the federal government; it authorized a permit system for the scientific investigation of antiquities on federal land; and, peripheral to this discussion, it established a process whereby the President could set aside areas of "importance" for national monuments. In this manner, the law established a national principle relating to heritage – that cultural resources, regardless of origin, were an important fabric of the cultural history of the United States and were worthy of protection.

This attempt at protecting the cultural heritage of "all" Americans carried with it an unintended complication. The permit system which was established privileged the scientific community in that "the examinations, excavations, and gatherings are undertaken for the benefit of reputable museums, universities, colleges, or other recognized scientific or educational institutions, with a view to increasing the knowledge of such objects, and that the gatherings shall be made for

permanent preservation in public museums." Thus, early on in the historic preservation legislation, American Indians were denied any consideration of any interests they might have had in protecting their own unwritten history and material culture from appropriation by those "reputable museums, universities, colleges, or other recognized scientific or educational institutions." While the federal government deemed it was important to protect the material evidence of the American Indian cultures that had gone before, the fact that the contemporary tribal groups did not rate a mention in the law perhaps illustrates the amount of consideration that living American Indians rated at the time.

The cultural context of the time of the passage of the Antiquities Act is telling as well, especially as it related to those American Indian groups and their participation in federal legislation related to heritage preservation. 1906 was during the second decade of the federal government's grand experiment to "de-Indianize" the Indian by turning them from nomads into farmers and from communal land ownership/stewardship into individual "owners" of land. The Dawes Commission (1893–1907) and the Jerome Commission (1889–1893) turned millions of acres of American Indian tribally owned land into small allotments owned by individual Indians, with the "excess" land made available to homesteaders and non-Indian settlers. In this way, the land within and upon which Native American heritage rested was removed from American Indian control.

It was not until the passage of the Archaeological Resources Protection Act (ARPA) in 1979 that Native Americans were formally incorporated into historic preservation legislation, being given the right to participate in the granting of permits for archaeological excavations on Indian land. Still, while the uniform regulations developed to carry out ARPA required consultation with tribal groups who owned the land upon which the archaeological resources were located, the intent of these regulations was more to govern the issuance of permits than to involve American Indian groups. Additionally, as demonstrated by the inclusion of human skeletal material as "cultural resources" within the definitional section of the Act, Native American sensibilities were far removed from any underlying intentions of the Act.

While these two laws have had strong influences on the extent to which Native Americans have become involved in cultural heritage management, the most far-reaching law has been the National Historic Preservation Act (NHPA) of 1966, but only after the passage of later amendments.

The NHPA requires federal agencies to identify and mitigate the impacts of federal actions on historic properties within the scope of the federal project. These agencies conduct or contract for cultural resources surveys to find the historic properties that might be affected by the project, find the most appropriate ways of protecting the information within those properties, and then document the information so that the American public derives a benefit from the entire process.

As one aspect of this process, federal agencies consult with Native American groups in order to determine the extent to which American Indian heritage issues are impacted. Consultation (defined in the federal regulations that govern the NHPA as "the process of seeking, discussing, and considering the views of other participants, and where feasible, seeking agreement with them regarding matters" arising in the compliance process (King 1998: 94) is required at various stages in the historic preservation compliance process. In the United States, the status of land ownership or the level of federal involvement in a project determines which (or even whether) cultural resources protection laws apply. Federal laws apply to projects that occur on federal or tribal land, if there is federal funding involved in a project, or if a federal permit of any kind is required for the project to occur. Privately funded projects on private land are not required to follow federal laws regarding cultural resources *unless* a federal permit is required for the project to occur.

In addition to the consultation requirements of the NHPA, amendments to the Act passed in 1992 enhanced the role of tribes in the national preservation program. The amendments also strengthened the protection to places of cultural significance to Indians and Native Hawaiian

organizations. Specifically, the amendments allowed for the creation of tribal historic preservation programs and funding mechanisms, allowed for the creation of a competitive grant program to fund tribal initiatives in this regard, and required that one presidentially appointed member of the Advisory Council on Historic Preservation be a Native American or Native Hawaiian.

In 1996, as a result of the 1992 amendments, the National Park Service of the United States Department of the Interior approved the applications of 12 American Indian tribes to assume the responsibilities of the State Historic Preservation Officer to carry out compliance activities on tribal lands. By assuming these functions, the tribes agreed to be responsible for conducting (or causing to be conducted) historic property surveys within the areas under their jurisdiction, preparing and maintaining permanent inventories of historic properties within the lands under their jurisdiction, nominating properties to the National Register of Historic Places, and reviewing federal agency undertakings pursuant to Section 106 of the NHPA. As of July 2018, 183 tribes have been formally recognized as qualified to take over SHPO responsibilities on their lands.

Under the NHPA, Tribal Historic Preservation Officers are officially designated by a federally recognized Indian tribe to direct a program approved by the National Park Service. In addition, the THPO must have assumed some or all of the functions of State Historic Preservation Officers on the lands under the tribe's jurisdiction. In this manner, it is the tribe, and not the particular state (or states) within whose borders the tribe lies, that has the final say regarding the effects to cultural resources.

Key Issues and Current Debates

Limitations on Tribal Heritage Management Programs

The status of land ownership is the primary factor taken under consideration in regard to implementing federal historic preservation programs. As noted above, federal laws apply only to projects that occur on federal or tribal land, if there is federal funding involved in a project, or if a federal permit of any kind is required for the project to occur. Privately funded projects on private land are not required to follow federal laws regarding cultural resources *unless* a federal permit is required for the project to occur.

In this regard, some tribal groups are geographically removed from their aboriginal lands as a result of federal removal policies of the 1800s which forced tribal groups to give up land in the eastern United States and move to areas hundreds of miles away. Some groups still occupy large tracts of land within traditional or aboriginal lands within reservations originally defined in the 1800s. In other areas such as Oklahoma, land ownership has been interrupted because of the actions of the Dawes and Jerome Commissions that divided up reservation lands into individually owned allotments. This land tenure issue is doubly important, however, when one takes into consideration the fact that the cultural heritage of Native American tribes is so closely tied to the lands where their cultures originated, developed, and flourished – lands that, in the majority of cases, are no longer under the jurisdiction or control of its original occupants.

Additionally, because of the vast number of different tribal groups (567 as of October 1, 2017), land issues, relationships with local and the federal governments, financial conditions, size of population, and other issues vary by tribe. For some tribes like the Navajo Nation, it is economically and geographically feasible to undertake a heritage protection program, while, for others such as the Berry Creek Rancheria of Maidu Indians of California, finances and small population numbers preclude the need for such action.

Balancing scientific values required under federal laws with tribal values associated with heritage protection is a difficult and challenging task for tribal groups involved in heritage management programs. Because of the importance of oral tradition within tribal culture, many tribal historic preservation plans emphasize the importance of ongoing consultation with tribal elders and spiritual leaders with special knowledge of the tribe's traditions. Tribal groups also have given emphasis

to the importance of protecting "traditional cultural properties." These places are eligible for inclusion on the National Register of Historic Places not merely because of any archaeological or historical reasons but because of their association with cultural practices and beliefs that are rooted in the history of the community. They are important in maintaining the continuity of the community's traditional beliefs and practices and are links between past and contemporary cultures.

There are, however, many tribal programs that successfully managed to incorporate the best of tribal and scientific values (Swidler et al. 1997; Dongoske et al. 2000). The Society for American Archaeology published a "Working Together" column in the *SAA Bulletin* (http://www.saa.org/AbouttheSociety/Publications/SAABulletin/tabid/1341/Default.aspx) that explored these issues. The Society's current venue, the *Archaeological Record* (http://www.saa.org/AbouttheSociety/Publications/TheSAAArchaeologicalRecord/tabid/64/Default.aspx), continues to offer examples of ways that tribes work in these fields. These projects provide models for how archaeologists and indigenous peoples can work together to attain goals that are mutually beneficial to all heritage management parties involved.

Examples of Tribal Heritage Management Programs

The Navajo Nation exists within the largest reservation in the United States, covering about 25,000 miles^2 (about 65,000 km^2). The development of the Navajo cultural resources management program should be seen as a watershed event in the history of American Indian heritage management. The establishment of the Navajo Tribal Museum in 1956 was the beginning of tribal involvement in an archaeological and historical research program. In January 1972, the Navajo Tribal Council passed a resolution enacting an Antiquities Preservation Law for the Navajo Reservation which acknowledged the existence of the many ruins and artifacts on the Navajo Reservation. It also noted that the sites and objects were irreplaceable and invaluable in the study of the history and preservation of the cultural background of the Navajo Nation. It went on to set up procedures for permitting archaeological studies, the punishment of lawbreakers, and the protection of the resources. This resolution was one of the first attempts to extend tribal protection over cultural resources on tribal lands.

In 1977, the Navajo Nation established its own Cultural Resource Management Program to combine Navajo customary knowledge with professional anthropological expertise. Today it maintains several programs relating to protecting and preserving Diné (Navajo) culture in the Arizona, New Mexico, Colorado, and Utah region of the American Southwest, including its Chaco Sites Protection Program, its Cultural Resources Compliance Section, Facilities Management, its Forestry/Natural Resources Program, a Roads Planning Program, and its Traditional Culture Program. The overall program is not a tribally operated copy of the dominant scientific culture, however; the Navajo use traditional religious practitioners in the identification of project impacts on sacred sites, shrines, and other localities of importance to the Navajo quite apart from any other archaeological or ethnographic professionals (Navajo Nation n.d.).

The Zuni, another tribe in the American Southwest, have been involved in cultural preservation programs since the formal establishment of the Zuni Archaeology Program in 1978 and formed the Zuni Cultural Resource Enterprise in 1982. In 1994, the tribe preplaced the Zuni Archaeology Program with the Zuni Heritage and Historic Preservation Office, which is charged with the development and implementation of tribal policies to preserve the cultural and historic heritage of the Zuni people. This new organization now operates with a staff separate from that of the Zuni Cultural Resource Enterprise.

Since then, the tribe has been able to protect its cultural resources in the manner it wishes, without relying on outsiders to implement what might be perceived to be alien policies and procedures. The Zuni government recognizes the need for protecting their heritage as well as the benefits of

cultural resources management. They play an active role in the federal cultural resources management compliance process in a way that provides an interface between the historic preservation bureaucracy and the tribal structure in a way that helps to alleviate conflict between the tribe and outside interests. Additionally, the formulation of the Cultural Resources Advisory Team of the Pueblo of Zuni in 1991 added another process by which cultural resources are protected by the Pueblo.

In the state of Oregon in the American Northwest, the Cultural Resources Protection Program of the Confederated Tribes of the Umatilla Indian Reservation (CRPP n.d.) has been in existence since 1987 and was one of the first 20 tribes to take over the function of the Oregon State Historic Preservation Officer in 1996. It utilizes a combination of educational programs including cultural sensitivity, tribal cultural resources management perspectives, and other areas relative to heritage management. It also incorporates traditional cultural knowledge into its program as a means of further customizing its approach to the management of heritage resources important to the tribe and its members. Through these processes, the Umatilla have managed to modify the federal program into one that meets the needs of the tribal communities rather than only those of the anthropological or archaeological community.

As a result of treaties between the Choctaw and the United States, the Choctaw left their homeland in Alabama and Mississippi and trudged more than 400 miles westward to new lands in Oklahoma. This resulted in two things: the archaeological and historical manifestations of Choctaw heritage were no longer under tribal control, and the archaeological heritage of the Caddo and Wichita was placed under the control of the Choctaw as new landowners.

After the jointly held tribal land was divided among individual Indians during the allotment period, and after the excess land was opened to homesteading by non-Indians, the tribe had only minor control over cultural heritage that existed on non-Indian-owned lands. Currently, however, the Choctaw Nation of Oklahoma maintains a Tribal Historic Preservation Office as a means of protecting not only the historic culture of its own tribal members, but it also works with the Caddo Nation of Oklahoma and the Wichita and Affiliated Tribes of Oklahoma through intergovernmental agreements and procedures to ensure that the heritage of all groups is protected in ways each tribe wishes them to be protected.

These examples are glimpses of ways that tribal organizations are involved in heritage management and heritage protection. They are committed to protecting the manifestations of heritage on the landscapes over which they maintain control. More importantly, however, many tribal groups see cultural and heritage preservation as more than the protection of the archaeological or historic sites that more often are the focus of archaeologists. Some tribes focus on the interrelationships between land and people rather than on the single manifestations of human habitation on the landscape; others include botanical and other resources among items of heritage and provide mapping to prevent the destruction of traditional gathering places of wild resources; still others utilize state-of-the-art geophysical techniques to identify and protect areas that contain tribal grave locations.

The National Association of Tribal Historic Preservation Officers (NATHPO)

In 1998, the National Association of Tribal Historic Preservation Officers was formed to "support the preservation, maintenance, and revitalization of the culture and traditions of Native peoples of the United States." It does this through its support of tribal officials who undertake the role of the Tribal Historic Preservation Officer through training programs, lobbying for improved historic preservation funding, and providing an interface between federal agencies and the tribes. It also serves as a clearinghouse for tribal issues related to historic preservation, repatriation, and other cultural issues deemed important to the continuation of tribal sovereignty (NATHPO n.d.).

As is apparent in the previous discussion, American Indian tribes have chosen to participate

within the United States' cultural resources management and preservation programs. Many of the tribes operate programs that mirror those of the federal government as a means of protecting tribal historic resources from impacts to the physical manifestations of tribal history; many others have extended the definition of "cultural resources" to cover other aspects of heritage such as language, places where traditional plants are gathered, sacred locations, and other traditional cultural properties.

In this manner, Native American tribal programs have adapted federal programs to fulfill the needs of their membership in ways that strengthen ongoing concepts of tribal identity, contribute to the education of young tribal members, and protect one of the more important pieces of the fabric of American Indian life.

Cultural Heritage Management and Poverty

Andrew Sneddon
UQ Culture and Heritage Unit, University of Queensland, Brisbane, QLD, Australia

Introduction

For most of the time that cultural heritage management has been a discipline of study and practice, the impoverished members of society have been overlooked. Their contributions to the world's tangible and intangible heritage have been undervalued, and their role in the management of their own heritage has been minimized. In recent decades, this has changed to a considerable degree, but the process of bringing the poor from the periphery to (or closer to) the center of heritage management has been a complex one.

Definition

This entry considers the evolution of cultural heritage management from the perspective of the less advantaged members of society. It considers "poverty" as an evolving subject of study within cultural heritage management, while also considering the ways in which the material culture of the poor (including the gentrified poorer quarters of cities) are now drivers for heritage town planning and sympathetic urban redevelopment. It considers the involvement of "the poor" in community-based heritage planning and the role of heritage in the empowerment of Indigenous communities (which are commonly the most disadvantaged members of society).

Key Issues/Current Debates/Future Directions/Examples

Moving the Poor from the Periphery to the Core of Cultural Heritage Management

In the eighteenth and nineteenth centuries, "cultural heritage" (including the disciplines of

archaeology, art history, and architecture) was commonly the preserve of the wealthy. The "Grand Tour," as often as not, involved elites visiting the aging villas and ancient palaces of other elites. Most archaeologists (even those that did not necessarily come from wealthy backgrounds themselves) concentrated their efforts on the lavish tombs and palaces of Egyptian pharaohs and Mycenaean warrior-kings, while architects and art historians tended towards the study of grand monuments and masterpieces at the expense of the modest dwellings and art forms of the poor. As a result, a one-dimensional history of the world began to emerge, in which the history of past cultures became a history of the wealthy and powerful. The "other 98%" of society featured less commonly in these histories.

This phenomenon was reflected in the management of cultural heritage at the time. Typically, heritage management was governed by the principle of property ownership, which excluded less wealthy members of society from the process. To use the UK as an example, the *Ancient Monuments Protection Act 1882* was controversial (only narrowly being voted by parliament into law and only after a number of attempts) because it placed responsibility for the conservation of ancient monuments in the hands of government, thereby taking control of items of national heritage out of the hands of private (and almost invariably wealthy) land owners. There was, and still is, a clear philosophical divide between those who assert that property rights should prevail over the rights of the community to conserve and appreciate the nation's heritage, on the one hand, and those who argue that the community's views and interests should prevail over those of individual property owners, on the other hand. In the nineteenth century, when government became involved in the management of the national estate at all, it was typical to impose its own view of order on the populace and rarely took account of the heritage of its poorer citizens. For example, Haussmann's rebuilding of large parts of Paris (1853–1870), which resulted in the fine boulevards that characterize the city today, was carried out at the expense of large swathes of the medieval city, which were demolished en masse, despite the objections of the city's poorer residents.

This period was not entirely without proponents of a different approach to cultural heritage. The nineteenth-century essayist and art critic, John Ruskin, argued strongly for the conservation (rather than restoration) of cultural heritage places, which to Ruskin included the works of humble artisans and craftspeople. While Ruskin's political philosophy inspired early Christian Socialists and the creators of the welfare state, his philosophy in relation to art and architecture, which emphasized the "dignity of labor," underpinned the "Arts and Crafts" movement – a movement that drew inspiration from the tastes and skills of the poorer classes.

At around the same time, people began to appreciate the importance of good housing for the working classes. While European industrialization was at its height, some wealthy industrialists made a point of constructing "model villages" for their workers, drawing on sentimental perceptions of the rural idyll as inspiration for their housing schemes. These model villages provided a mental template for what the "true" historic English village looked like and became somewhat kitsch heritage goals to aspire to. Some of these model villages (e.g., Saltaire in Yorkshire) are today cultural heritage places in their own right. However, it took some time for the profession of town planning to truly appreciate the importance of a city's older quarters to its character and sense of self. It was not until after the Second World War, when inner-city gentrification became fashionable in western society, that the principles of town planning and urban design were augmented to reflect this concept. Sites that had hitherto not generally been thought of as heritage places, including the former residences and work places of the down-at-heel (rows of Victorian terrace houses and the chimney stacks of defunct factories), began to be listed on heritage registers and to receive legislative protections.

Such places are now commonly protected by legislation that makes no distinction between the heritage places of the rich and poor. For example, the Burra Charter, which provides guidelines for the assessment and management of heritage

places, makes no distinction on the grounds of the economic circumstances of the place's construction. In fact, the criteria that the Burra Charter provides for the assessment of heritage places are entirely neutral on this subject.

The Poor as an Object of Study

In the first half of the twentieth century, there was a slow shift away from the academic focus on the history and material culture of the rich and powerful. This has seen a concomitant expansion of the concept of cultural heritage and an embrace by many of the heritage of "slums," "the working class," and "the humble abode." Marxist theorists in particular began to ask very different questions of material culture in the early decades of the twentieth century, reorienting the emphasis of study towards the lives of the urban and rural poor. The "archaeology of poverty" has become a productive field of research for historians and archaeologists, particularly as inner-city development commonly occurs on the sites of the earliest-settled parts of cities (e.g., New York's "Five Points" and Melbourne's "Little Lon" District). Related to this are fields of research such as "the archaeology of capitalism," "the archaeology of inequality," and "the archaeology of slavery." Similarly, archaeologists began to expand their interests beyond the classical cultures of Greece and Rome to include prehistoric and "non-complex" cultures where the badges of rank and status were less clear and possibly less relevant. Archaeological sites, characterized by little more than scatters of stone artifacts or rudimentary mud-brick dwellings, appeared more commonly in both the academic and nonspecialist literature.

These shifts in the archaeological literature were reflected in the broader fields of cultural heritage. A new discipline – industrial archaeology – began to emerge in the 1970s and 1980s. "Industrial archaeology" does not necessarily involve material culture excavated from below the ground. Rather, it is a fast-expanding field of cultural heritage that concerns itself with the technologies, machinery, and work places of past cultures. In other words, it deals with the kinds of material culture that were traditionally the domain of the working classes and the poor.

Town planners have also been responsive to the desire of many people to reinhabit the houses and streets of the historically poorer parts of cities. The "gentrification" of parts of the world's great cities has been accompanied by new fields of research in architecture and design. Today, instead of the demolition of old buildings, we are more likely to see their retention and adaptive reuse. This trend has seen the emergence of a new kind of architect who specializes in the creative introduction of contemporary design into historical built forms.

Similarly, heritage interpretation has shown a willingness to embrace the stories of the urban and rural poor. Plaques, heritage trails, and public art now commonly reconnect us to the lives and living conditions of the poorest members of past societies.

The Poor as Participants in, and Proponents of, Cultural Heritage Management

In 1963, the monumental and iconic New York landmark Pennsylvania Station (or "Penn Station") was demolished in the face of international outcry. Many have pointed to the demolition of this heritage building as the birth of the modern architectural preservation movement. The demolition of Penn Station formed part of a program of "urban renewal" which was resisted by representatives of all sections of New York society on the grounds that it failed to appreciate the importance of historic built forms and ways of life. The 1950s and 1960s were characterized by many such urban renewal initiatives across the world. They typically entailed the wholesale demolition of the older parts of cities, those usually inhabited by the urban poor, and the construction of "modern" high-density residential structures in their place. This often pitted town planners and architects (who commonly held a single-minded commitment to the principles of "modernism" and to Le Corbusier's objection to the "disorder" of working class living places) against residents and others who recognized the value that the older parts of town (often places characterized by existing or recent poverty) lend to the character of a city as a whole. As a result, the latter decades of the twentieth century saw a movement towards the

recognition of the rights of *all* residents (including the poor) to be consulted in relation to the redevelopment of their living places. Today, legal processes in most developed countries provide everybody, including the poor, with access to the courts in order to object to development that they find offensive.

In Australia, a modernist-inspired movement to demolish some of the country's oldest homes in the inner-city Sydney suburb of "The Rocks" resulted in widespread resistance from both the local residents and the union movement, which imposed the so-called "green bans" on heritage places earmarked for demolition. Their resistance saved numerous heritage homes from the wrecking ball and resulted in the retention of social housing in this part of the city.

Similar battles are now being fought outside of the western world. Recent decades have seen an increased appreciation of the rights of Indigenous cultures to conserve both their tangible and intangible heritage. Indigenous cultures are commonly the most marginalized and economically disadvantaged members of society and their opposition to mining and development activities that threaten their cultural heritage often occurs at great personal and financial risk. The management of the impacts of such things as rampant tourism on the tangible and intangible heritage of Indigenous cultures (e.g., at Angkor in Cambodia and Machu Picchu in Peru) is a common challenge, recognized by UNESCO through international conventions such as the *Convention for the Safeguarding of the Intangible Cultural Heritage 2003*, which makes no distinction between the living heritage of the rich and poor. Equally, there are many who now recognize that cultural heritage can actually provide a means of poverty alleviation by providing developing countries with opportunities for sustainable development.

Today, all sections of society are heavily involved in cultural heritage practice. For example, community archaeological excavations regularly invite participation from volunteers, many of whom ask the legitimate question: "well, whose heritage is it anyway?" Meanwhile, in the inner-city suburbs of our metropolises, the gentrification of once down-at-heel places has seen a renewed appreciation of the houses and technical skills of yesteryear's poor. In most developed countries, all members of a community have the right, through heritage legislation, to be consulted about the form that their part of their cities may take and to object to offensive development in the courts.

Cultural Heritage Management and Submerged Sites

Joe Flatman
English Heritage, London, UK

Introduction

Submerged cultural heritage encompasses everything from shallow, freshwater environments, through the coastal zone, down into the waters of the continental shelves, and ultimately into the abyssal depths of the oceans. Unfortunately, national inventories for such sites are still in their infancy, well behind equivalent inventories for cultural heritage sites on land. Meanwhile, international, collaborative inventories of submerged cultural heritage are virtually nonexistent. But hundreds of thousands of historically known wrecks have been mapped around the world, alongside countless other single find-spots of cultural materials identified by archaeologists, divers, fishermen, and other marine-zone users. There are thus potentially millions of such sites in existence, including everything from single find-spots up to complicated multiperiod submerged "landscapes." Technological advances now mean that there is no corner of the worlds' oceans that is not accessible to humans, although the logistics and costs of such access remain considerable, particularly in the deep ocean (Ballard 2009).

Submerged cultural heritage site types can be split into four main groups:

1. Wreck sites that are the result of accidental or deliberate loss (including sea, air and spacecraft debris, also land vehicles like tanks lost during amphibious warfare or transport)
2. Submerged settlement sites, especially prehistoric sites, that have been inundated over the long term through natural processes of climate change
3. Coastal industrial and settlement sites submerged due to medium- to short-term processes of flooding and erosion, both naturally and culturally driven
4. Inland and coastal freshwater and wetland sites, including lakes and rivers

The latter include both sites that have been lost to natural processes of coastal flooding and erosion and also through *cultural* processes of large-scale environmental management, particularly water management schemes that flood cultural sites, a contentious practice that has regularly been challenged by resident, especially Indigenous, communities. The US National Reservoir Inundation Study undertaken between 1976 and 1980 was one of the first and remains one of the best examples of the analysis of the impact of such practices on cultural remains (Lenihan et al. 1981).

There are particular issues of the public understanding of and engagement with submerged cultural heritage, including problems of understanding from within government. The scale and invisibility of many such sites encourage an "out of sight, out of mind" mentality among many communities. Related to this are issues of the lack of clear responsibility for site management, with a large number of sites lying in international waters outside of the direct control of any one nation, representing legally ambiguous sites with no management analogies to sites on land. The extreme depths of some sites, and thus the technical problems (also costs) of site access, exasperate these management problems. Even within the territorial waters of individual nations, cultural heritage management on submerged sites is regularly confused by an overly complicated management and planning regime. In general, most nations manage their marine cultural and natural assets, and also their terrestrial and marine environments, via different planning policies, environmental protection, and management laws. Different departments within a single government are in turn usually responsible for these different policies and laws. Such policies and laws operate within a broader management framework – including specific national cultural heritage laws, for which again there is often further variation in application and extent between the land and sea

zones. Exasperating this complicated management regime, many governments also fail to maintain overlapping terrestrial and marine zone datasets and inventories. Overall, such fragmented management and data regimes prevent a "seamless" understanding of these different environments and thus make effective cultural and natural heritage management extremely difficult. Such dedicated marine cultural resource management teams as different governments maintain – if any – are also usually under-resourced and overcommitted. One of the best known and most experienced of these is the US National Park Service's Submerged Resources Center (formerly the Submerged Cultural Resources Unit) founded in 1980 (Lenihan 2002).

Definition

The term "underwater cultural heritage" is most often used to define submerged heritage sites, including in legal terms. UNESCO defines underwater cultural heritage as meaning "all traces of human existence having a cultural, historical or archaeological character that have been partially or totally under water, periodically or continuously, for at least 100 years" (UNESCO 2001: article 1, point 1(a)).

Recognizing the urgent need to preserve and protect such heritage, UNESCO developed the *Convention on the Protection of the Underwater Cultural Heritage* in 2001 (UNESCO 2001) in order to promote international collaboration in the field of submerged cultural heritage. In January 2009, this convention came into force with respect to the first 20 States that had deposited their instruments prior to October 2008. As of September 2011, 40 nations had ratified or accepted the convention (Dromgoole 2006). However, many nations with major marine industrial or commercial commitments have so far failed to ratify the convention, variously citing (a) concerns about "creeping coastal state jurisdiction" (e.g., additional legal responsibilities stemming from ratification, which could upset the international jurisdictional balance achieved under the United Nations *Convention on the Law of the Sea* (UNCLoS) (1982) – see below), (b) concerns about the possible dilution of the principle of Sovereign Immunity by the convention (see below), and (c) the convention's "blanket" application to all underwater cultural heritage irrespective of relative archaeological or historical significance. Many nations also voice broader concerns as regards the costs of management and enforceability of the principles laid out in the convention.

In terms of definition, it is important to also clarify the basic relevant legal principles for the international marine zone as agreed under the United Nations *Convention on the Law of the Sea* (UNCLoS) (1982) (United Nations 2011):

- Article 3: Coastal States exercise sovereignty over their territorial sea, which they have the right to establish to a limit not to exceed 12 nautical miles.
- Article 49: Archipelagic States (made up of a group or groups of closely related islands and interconnecting waters) have sovereignty over a sea area enclosed by straight lines drawn between the outermost points of the islands.
- Article 57: Coastal States have sovereign rights in a 200-nautical mile "exclusive economic zone" (EEZ) with respect to natural resources and certain economic activities and exercise jurisdiction over marine science research and environmental protection in this zone.
- Article 76: Coastal States have sovereign rights over the continental shelf (the national area of the seabed) for exploring and exploiting it; from the shore, the shelf can extend at least 200 nautical miles or more under specified circumstances.

Of related relevance is also the principle of "Sovereign Immunity" (as agreed under Article 236 of UNCLoS (1982)). This relates to the wreck of any warship, naval auxiliary, and other vessels or aircraft owned or operated by a State and used only on government noncommercial service. Such wrecks are deemed to remain – irrespective of their location – under the control and ownership of their nation-states, unless lost by capture or sinking during battle, by international agreement,

or by an express act of abandonment, gift, or sale by the sovereign. Examples of such historic vessels protected under this principle include the CSS *Alabama* (lost 1864) (US ownership in French waters), HMS *Birkenhead* (lost 1852) (British ownership in South African waters), and HMS *Spartan* (lost 1944) (British ownership in Italian waters). Many nations also protect the remains of warships or aircraft (both on land and underwater) that are war graves through domestic legislation, for example, the US Sunken Military Craft Act (2005) or the UK's Protection of Military Remains Act (1986). Such laws operate over and above various nations' dedicated cultural heritage management laws.

Historical Background

The formal practice of cultural heritage management on submerged sites arose in the 1950s with the advent of commercially available technologies to access the marine zone regularly and reliably. To this end, cultural heritage management on submerged sites is a part of the wider global development of cultural heritage management as a practice and theoretical discipline following from World War II. Many of the approaches and philosophies of underwater cultural heritage management were consequently first developed on terrestrial sites. In the twenty-first century, there are increasing efforts being made to interlink terrestrial and submerged cultural heritage management practices and philosophies, such as through the use of "seamless" GIS datasets running across the coastline to allow the holistic management of contiguous terrestrial and marine cultural zones. An example of such seamless management are former island battlefield and/or military testing sites in the Pacific associated to World War II and the Cold War, such as at Chuuk Atoll (part of the Federated States of Micronesia), which was a major Japanese military base subject to assault by the US military in 1944 (Rainbird 2000), and Bikini Atoll (part of the Republic of the Marshall Islands), which was a US military atomic test site between 1946 and 1958 (Delgado et al. 1991) (Fig. 1).

Cultural Heritage Management and Submerged Sites, Fig. 1 A World War II US Sherman tank in Saipan's lagoon (Photo by Jennifer McKinnon, courtesy and copyright of Ships of Discovery)

Through the 1950s and 1960s, the rise of "sports" (e.g., amateur) (and to a lesser extent "commercial," e.g., professional) diving led to growing concerns with the looting of submerged heritage sites, initially of classical era wreck sites in the Mediterranean (UNESCO 1972) and later in more inaccessible areas, notably of historic wreck sites associated to the Spanish Armada around the western and northern coasts of Ireland and Scotland (Martin 1975), and also of Dutch East India Company (VOC) wreck sites around the Indian Ocean, especially the western coast of Australia (Parthesius 2009). Concerns about such activities were instrumental in the development of the formal academic discipline of "maritime archaeology" and also of the emergence of "avocational" groups dedicated to promoting public understanding and training. Notable among such organizations is the charitable Nautical Archaeology

Society (NAS) (founded in 1986), which has its origins in the Council for Nautical Archaeology founded in the UK in 1964. The avocational training scheme of the NAS has been taught around the world and is a central component of ongoing efforts to ensure consistent submerged cultural heritage management (Bowens 2008). Growing international concern about the extent of looting of submerged cultural heritage subsequently led to increasingly strenuous lobbying of governments around the world in the 1960s and 1970s, demanding that legal protection be given to submerged heritage sites commensurate to that already in existence on land. Such legal protection is now in force among many other nations around the world, although there remains a considerable disjuncture between and even within different nation's approaches in this respect. Many nations of the world also have yet to enforce any legal protection of their underwater cultural heritage. Since the 1980s, the problem of site-specific looting of historic wrecks has largely moved out of the sphere of individuals and into the growing international concern with what is sometimes erroneously termed "commercial maritime archaeology." This involves multimillion dollar organizations undertaking the wholesale looting of entire wreck sites to recover cargoes for resale, often in partnership with or on behalf of governments. Such salvage has been a particular problem in southeast Asian waters, with the recovery of materials – with limited archaeological analysis at best – of numerous sixteenth-, seventeenth-, and eighteenth-century CE China cargo ships. The recovered cargoes of such vessels have ended up at auction, their contents dispersed around the world and thus unavailable for comparative study. Such salvage is also undertaken in increasingly deep, often international waters of the continental shelves. Archaeologists criticize the recovery of materials from such sites for profit as being contrary to the ethical principles underlying archaeology (counter, in particular, to the 2001 UNESCO *Convention on the Protection of the Underwater Cultural Heritage*, especially the convention's Annex, Rule 2). Archaeologists also criticize such projects as being of limited scientific merit, with scant consideration of wider research objectives in the selection of sites to explore and recover materials from and with little attention being paid to the survey or recovery of nonprofitable but culturally important materials such as the hulls of vessels. In reply, proponents of such activities counter that the UNESCO convention is an unenforceable political and bureaucratic quagmire and that the concept of "preservation in situ" does not work (see discussion below).

The 1990s onward witnessed an expansion of interest in submerged cultural heritage management beyond the traditional concern of the protection of historic wreck sites. In particular, there has been growing global interest in the identification, exploration, analysis, and management of "submerged prehistoric landscapes." These are land surfaces that have been flooded after the end of the Last Glacial Maximum from c. 20000 BCE onward (Benjamin et al. 2011). Such interest has increasingly been undertaken in relation to industry, especially marine extractive industries such as oil and gas companies and aggregates extractors (Flatman 2012). Although the existence of such sites had been acknowledged since the early twentieth century, and their general extent hypothesized from the 1960s onward, it was only in the 1990s that the full extent and cultural significance of such sites began to be fully recognized, and formalized programs of cultural heritage management put in place (Fig. 2).

In particular, the Aggregates Levy Sustainability Fund (ALSF), a British government management initiative that ran between 2002 and 2011, funded millions of pounds of collaborative research between academia, commercial archaeology, and the marine aggregates industry exploring the extent of the submerged prehistoric landscapes of the southern North Sea within the UK's Exclusive Economic Zone (Gaffney et al. 2009). The ALSF also funded much other work relating to the prioritization of different marine cultural site types (especially different types of wreck site) and thus the development of refined types of exclusion zone around wrecks, as well as contributing greatly to the UK's dataset and mapping of such materials (Archaeological Data Service 2011). Similar initiatives to map, prioritize, and manage marine cultural assets have also

Cultural Heritage Management and Submerged Sites, Fig. 2 General distribution map of features analyzed by the North Sea Palaeolandscapes Project, from Gaffney et al. (2009: 83, Fig. 3.17) (Courtesy and copyright of the Institute of Archaeology and Antiquity, University of Birmingham, UK)

been implemented in other locations around the world, notably in US territorial waters by the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) through their management of federally controlled marine zones (BOEMRE 2011).

The later 2000s has witnessed an expansion of not the type of heritage site impacted by industrial developments, but rather of these types of industrial development themselves. In particular, there has been a growth of marine zone renewable energy infrastructure that has been recognized to have considerable potential impacts on submerged cultural heritage. This mainly comprises offshore and onshore wind farms, and to a lesser extent tidal energy barrages (Wessex Archaeology 2007). The later 2000s has also witnessed growing concern about other marine zone industries impacts upon submerged cultural heritage, including commercial fishing. Meanwhile, new marine industrial areas are coming into increasing commercial use for which the full potential of the cultural heritage has only just begun to be considered, especially the High Arctic.

In a different sphere, the 2000s witnessed a growing concern with the place of cultural heritage management in land and underwater "Integrated Coastal Zone Management" (ICZM). Such

management aims to reconcile the overlapping demands of different coastal zone industries with broader cultural values – including the protection of heritage – alongside medium-term environmental management regimes. In particular, this process has witnessed the recording of historic coastal sites felt at particular risk from coastal flooding and erosion and also from coastal management such as "hard rock" defenses as well as "soft" responses like "managed retreat" through the restoration of coastal salt marshes. The development of ICZM strategies has in turn led to specific types of related marine archaeological survey, most notably Rapid Coastal Zone Assessment Surveys (RCZAS). This is a distinctive form of rapid evaluation of coastal heritage assets that was first developed and implemented in England during the 1990s by English Heritage.

Key Issues

The current key issue in the field of submerged cultural heritage management is that of the legal status of such management, and stemming from this the effectiveness of existing management strategies. International cultural heritage management of submerged sites is currently enforced legally at a national level through various national laws (both specific heritage management laws and also broader planning and development laws and also policies). The majority of these laws and policies are ill equipped to deal with the scale, extent, and subtlety of submerged sites that do not conform to the normal expectations of cultural heritage sites found on land. In addition, international cooperation on cultural sites in transnational and international waters is still in its infancy. There are serious ongoing debates as regards the effectiveness of existing management strategies. In particular, this involves the question of the principle of in situ preservation as the preferred option for submerged archaeological sites. This is a principle common on terrestrial cultural heritage sites and is enshrined as a key principle in the 2001 UNESCO *Convention on the Protection of the Underwater Cultural Heritage*. However, the principle has been subject to sustained criticism in the marine zone, both the accusation that it is a form of "laissez faire" government (i.e., an excuse for minimal low-cost institutional intervention in submerged cultural sites on the grounds of a spurious preservation philosophy) and also that it neither protects sites effectively nor allows opportunities for archaeologists to excavate sites in order to gain new knowledge or learn how to properly execute such fieldwork and thus train the next generation of site managers. Leaving aside the published hyperbole on this issue – much of it self-servingly written by communities such as treasure hunters who have the most to gain by the public criticism of all forms of marine zone cultural heritage management – the concept of in situ preservation is a sound one with well-established practical and theoretical principles. However, there has been a lack of critical analysis of this principle's formal application in submerged contexts, given both the distinctive nature of submerged cultural sites (e.g., issues of their extent and survival) and also the nature of marine zone impacts on submerged archaeological sites in comparison to terrestrial sites (e.g., that terrestrial archaeological sites in many nations are required to be explored, including excavated, under law, even where remains will be left in situ, which is not true of most marine archaeological sites). Until marine archaeological sites are required under different nations' laws to be explored to the same extent as terrestrial sites in advance of development, this disjuncture between the protection and understanding of submerged cultural sites is likely to remain. This relationship is evolving – witness the increasing requirements of development-led marine archaeological intervention in relation to offshore renewable energy (Wessex Archaeology 2007) – but is still nowhere near the scale of development-led in situ site management witnessed on land (Fig. 3).

The principle of in situ preservation is based on a terrestrial heritage resource management model. This model has problems of compatibility in the marine zone on two fronts. Firstly, the terrestrial model assumes much lower levels of preservation and much lesser physical extent of sites than is commonly witnessed in the marine zone. This means that archaeological intervention in such

Cultural Heritage Management and Submerged Sites, Fig. 3 Offshore wind farm near the Isle of Thanet, UK, with the turbines between 7.1 and 10.8 miles distant (Photo by David Ball, courtesy and copyright of the US Bureau of Ocean Energy Management, Regulation and Enforcement)

sites on land can be relatively small scale and thus faster, easier, and cheaper. Secondly, the terrestrial model assumes generally precise, immovable locations of sites of the types hard to ensure and accurately measure in the shifting seabed of some marine areas. This means that it is much easier to leave some or all of a site in situ on land in comparison to at sea. These management problems are exasperated by the relative lack of data on the scale and extent of marine cultural heritage, which makes site prioritization hard to achieve – that is, the relative significance of different types or ages of site are difficult to judge. This means that modern terrestrial management principles on the basis of judgments of things like relative "significance," "setting," and so on are difficult to formulate for marine cultural heritage.

Barring a few high-profile discoveries, usually of historic ships – for example, the *Mary Rose*, the *Vasa*, the *Hunley* – most marine archaeological sites remain invisible to the general population, and even when in such cases they are visible, this is normally as a consequence of costly recovery efforts rather than in situ site management. Such public mentalities are hard to shift. Partly, this is an issue of influencing public perception. The marine natural environment lobby has worked hard over the past decades to foster a sense of communal responsibility for the seas and oceans of the world, of the need to respect and protect as communities marine biodiversity. These efforts have paid considerable dividends – concern about marine ecology is now on the "radar" of politicians. But many of the same threats to marine biodiversity also threaten marine cultural heritage. The problem is one of perception and recognition; these threats are not generally understood to be to cultural as well as natural heritage. Combined cultural and natural heritage site management regimes are in their infancy in this respect and require considerably greater political will, as much as anything in many cases forcing different responsible government departments for cultural and natural heritage to work more closely together in their shared interest. In some cases this even means the management of marine cultural heritage sites that represent a threat to the natural environment, for example, World War II era vessels leaking oil, such as the example of the wreck of the USS *Arizona* in Pearl Harbor, Hawaii, that is subject to ongoing monitoring by the US National Park Service (Murphy 2010) (Fig. 4).

Management regimes also need to be developed to better deal with the sheer extent of submerged cultural heritage. Current management models are still generally tied to the principle of

Cultural Heritage Management and Submerged Sites, Fig. 4 NPS archaeologist Matthew Russell conducting precision GPS survey on USS *Arizona* (Photo by Brett Seymour, courtesy and copyright of the US National Park Service)

"spot finds" of individual wrecks in precise locations, but this is not an effective form of management of many types of marine cultural heritage, in particular large, overlapping and complicated marine heritage sites such as prehistoric submerged landscapes on the one hand or World War I and World War II marine and coastal battle sites (covered with wrecked ships, aircraft, and other battle debris) on the other hand. What is needed in such circumstances are developments of the types of marine-protected zone or reserve commonly used to identify locations of marine natural environment significance, but which are exceptionally unusual in the case of marine heritage (a rare example being the USS *Monitor* National Marine Sanctuary off the eastern seaboard of the USA).

International Perspectives

As noted above, there are particular issues in UK waters as regards the management of submerged prehistoric sites in relation to industry. The example of the ALSF serves as a model for other nations to follow in which the key is close working relationships between archaeologists and industry. Overlapping EEZ management in the southern North Sea involving the UK and neighboring nations has also been attempted, reaching beyond the British national territorial sea remit of the ALSF, with governments working together to overcome the legal challenges to conjoined cultural heritage management and submerged sites (Peeters et al. 2009). What is most notable over the long term is the key place of the "public" in cultural heritage management of submerged sites. Around the world, there is a long and admirable history of public engagement helping to actively manage such submerged sites for the common good. Many of the most famous investigations of submerged heritage sites began as, and in some cases remained throughout, entirely "voluntary sector" activities with little or no government, academic, or other "professional" involvement – from shipwreck sites like the *Mary Rose* in England to the submerged prehistoric settlement of Tybrind Vig in Denmark. Thanks to initiatives like the Nautical Archaeology Society's (NAS) international training scheme, there are standards of good practice in place for the thousands of volunteers who yearly commit extraordinary amounts of time, effort, and money to the management of submerged sites, without reliance upon the often-insecure government or industry support.

Future Directions

Submerged cultural heritage management is likely to become a growing concern of the international heritage community in the mid-twenty-first century. This is due to issues of increased access, thanks to advanced marine survey/sensing technologies (especially remotely and autonomously operated underwater vehicles) alongside an

increased scale and intensity of marine resource development. As the growing global population makes ever-increasing demands for resources and as existing terrestrial supplies of many resources dwindle, the marine zone is an appealing source for such resources, both "traditional" resources such as oil and gas, minerals and metals as well as "alternative" resources such as renewable energy, alongside new developments such as large-scale marine zone farming for fish and nutrients. The marine zone is also increasingly being looked to as a locale for new developments such as deep ocean storage of CO_2 as forms of "carbon offsetting."

Industrial developments are particularly likely in areas of the world traditionally underexploited for marine resources but close to expanding industrial markets, such as the marine zones of Southern America, the Indian Ocean, and the South China Sea. Such locations have a limited history of formalized cultural heritage management, with little catalogued documentary and archaeological data to help judge the extent and significance of cultural resources in such areas. Meanwhile, speculators are increasingly also looking to the High Arctic as a potential new industrial and also shipping zone, anthropogenic climate change making these areas more accessible to oil and has exploration and cargo ships alike. The potential for cultural discoveries, especially submerged prehistoric remains, in all of these areas is significant, as is the likelihood of conflict with existing Indigenous Communities in these areas over the control of such industrial and also cultural resources. Such communities claims of ownership of submerged industrial resources on the basis of identified ancestral remains may become the great legal challenge of cultural heritage management in the twenty-first century, akin to the land ownership battles on the basis of cultural patrimony of the Americas and Australia in the 1980s and 1990s.

Cultural Heritage Management and the Colonial Culture

Ian J. McNiven[1] and Sean P. Connaughton[2]

Introduction

In the wake of Columbus' voyages of "discovery" of the Americas in the late fifteenth century, Europeans began aggressive colonial settlement of what became known as the New World regions of North and South America. Continuing European maritime explorations of the world in the sixteenth, seventeenth, and eighteenth centuries resulted in the establishment of colonies in Africa, Southern Asia, Australia, and Oceania. While the history of colonial impact in these various places differed in form and scale, in all cases it involved the European appropriation of Indigenous lands and seas. In settler-colonial contexts such as Australia and the USA, such appropriation frequently involved removal of Indigenous peoples from their lands, often through murder. Left behind were landscapes materially rich with cultural sites and places representing the cumulative products of millennia of complex and intimate cultural engagements by countless generations of Indigenous peoples. The ensuing history and fate of these cultural sites and places parallel in many respects the ways local Indigenous peoples were subsequently treated by colonial regimes. Equally

important, such history entails not only colonial disassociation of Indigenous people from their cultural sites but also colonial appropriation of these sites by European colonizers in the name of science, heritage, and nation building. Reversing the colonial processes of disassociation and appropriation has been a challenging task for Indigenous communities seeking to regain control of their pasts and cultural sites within the broader context of redefining and attaining social, political, economic, and cultural autonomy within nation states (Atalay et al. 2014; Colwell-Chanthaphonh and Ferguson 2010; Nicholas and Andrews 1997; McNiven and Russell 2005; Smith and Wobst 2005; Liebmann and Rizvi 2008; Lydon and Rizvi 2010). The settler-colonial contexts of the USA, Canada, and Australia provide well-documented and instructive examples of these anticolonial dynamics.

Definition

The process of colonization of Indigenous peoples and their lands is complex and varied and subtle and catastrophic. The intensity of impact was broadly correlated with the intensity of colonial settlement, with major urban regions seeing the most extreme examples of usurpation and destruction of Indigenous cultural sites. In more remote regions, colonial impact was marginal, with Indigenous peoples often maintaining strong traditional relationships with their lands, seas, and cultural sites. Yet in all settler-colonial settings such as the USA, Canada, and Australia, erasure of Indigenous sites was seen to be as important to the success of colonial settlement as removal of the peoples themselves. Erasure was both literal and symbolic. Literal erasure was the most obvious strategy and involved physical removal or destruction of cultural sites and objects. Expanding settlements with roads and railway lines, deforestation, and plowing of topsoil to make fields literally obliterated millions of Indigenous sites and objects across the Americas and Australia. A more symbolic and in many ways more insidious and pervasive form of erasure was redefinition and appropriation of Indigenous cultural sites and objects as non-Indigenous. Such symbolic appropriation was underwritten by Eurocentrism and the denial of history and inventiveness to Indigenous peoples located far from the self-proclaimed cultural hearth of Europe (Blaut 1993). While literal (physical) erasure has at its heart the process of forgetting, symbolic erasure also acts to undermine the legitimacy of Indigenous occupation and connections to place (Trigger 1989; Kehoe 1998; McNiven and Russell 2005; Díaz-Andreu 2007). The legacy of this history of erasure and appropriation underpins and defines the colonial culture of contemporary practices of cultural heritage management.

Examples

In Canada, much like the USA and Australia, the interpretation of archaeological sites during the late nineteenth century to early twentieth century was steeped in racist views of Indigenous peoples and their lifeways. Colonial settlers viewed the Indigenous past (and present places which Indigenous people occupied and continued to use during the colonial era) as disposal. A celebrated example of physical erasure occurred in Stanley Park located in Vancouver where the Coast Salish village site – *xʷáyxʷay* – was mined to surface the park's first road in 1888 (Fig. 1). Little is known about this village from an archaeological perspective, as the site's matrix was dispersed across the park as part of the road construction (Barman 2005:21). *xʷáyxʷay* was (and still is) an important place, with an origin story and deep significance reflecting Coast Salish peoples' relationship to what is now known as Stanley Park. The forced removal of Indigenous peoples from this place in the early twentieth century further demonstrates how the government determines where "Indianness" stops and property begins (Wolfe 2016:145). Even today Indigenous peoples must organize themselves to prevent the destruction of ancient sites and sacred places in the face of development capitalism.

Earthen mounds in the USA and Kimberley rock art of Australia provide celebrated examples of symbolic erasure. The monumental earthen

Cultural Heritage Management and the Colonial Culture, Fig. 1 Photograph of *xʷáyxʷay* being destroyed. (J. Wood Laing photo, City of Vancouver Archives, SGN 91)

mound sites of southeastern USA gave rise to the myth of the Mound Builders as archaeologists in the nineteenth century delved into their supposedly mysterious origins. Marginalizing sixteenth- and seventeenth-century European observations of Native American ritual use of these mounds, a colonial narrative was created such that the mounds were ascribed a non-Indigenous origin, with possible ancestral links to the barrow cultures of ancient Europe. Native Americans were subsequently presented as usurpers of the Mound Builder race. This ideologically driven interpretation represented Native Americans as violent and savage destroyers of a sophisticated society and unworthy of respect. Such views were part of a broader ideology which attempted to delegitimize Native American connections to land and cultural sites and to present European colonization as righteous, legitimate, and indeed worthy (Silverberg 1968; Kehoe 1998; Mann 2002; Wolfe 2016).

The Kimberley region of northern Western Australia is renowned for two major styles of rock paintings – recent Wandjina figures with large radiant heads and much older Gwion Gwion ("Bradshaw") figures with slender bodies and elaborate adornments (Fig. 2). Since these paintings came to the attention of Europeans in the nineteenth century, their complexity and aesthetic virtuosity were seen to indicate a non-Indigenous origin. In short, the European representation of Aboriginal Australians as primitive "savages" precluded ascribing elaborate Kimberley rock art an Indigenous origin. As with the Mound Builders myth, Aboriginal Australians were seen as recent interlopers who, unlike Europeans, were not legitimate and worthy inheritors of the Australian landscape and its complex human past (McNiven and Russell 2005; McNiven 2011; Porr and Bell 2012).

Key Issues

With the professionalization of archaeology as a formal discipline in the late nineteenth and early twentieth centuries, colonialist narratives of Indigenous pasts in the USA, Canada, and Australia were increasingly replaced by more scientific approaches to the past. As a result, ancient human sites and objects and associated "prehistoric" cultures were seen to be of Indigenous origin. As more resources were directed toward

Cultural Heritage Management and the Colonial Culture, Fig. 2 George Grey's colonialist recording of a Wandjina following his 1838 observations. (From Grey 1841, 1: plate opp. p. 214)

archaeological research in the USA, Canada, and Australia, understandings of the deep chronology and historical and cultural complexity of Indigenous occupation of both landmasses grew dramatically. In North America in particular, this resourcing of archaeological research took place in the context of the development of museums which became storehouses for millions of Native American objects and the skeletal remains of hundreds of thousands of Native Americans (Thomas 2000). In Australia, archaeology developed more slowly, with large museum collections of Aboriginal artifacts and ancestral remains developing within the second half of the twentieth century.

The pace of development of archaeological research in both North America and Australia was matched by the enactment of laws to protect Indigenous archaeological sites. In the USA, the *Antiquities Act* of 1906 was aimed inter alia at protecting and preserving Native American archaeological sites from the ravages of "pot hunters." The scope of this protection was expanded considerably with the *Archeological and Historic Preservation Act* of 1974 which made it an offense to destroy Native American archaeological sites without prior assessment during projects either funded or endorsed by a federal agency.

Canada does not have a single definition for federal cultural heritage in Canadian law despite earlier attempts (Burley 1994). Rather, it is defined by specific statutes enabled by provincial governments. In British Columbia, for example, tangible cultural heritage is regulated by the Archaeology Branch which enforces the *Heritage Conservation Act* (*HCA*) (RSBC 1996) but only protects sites that existed pre-1846. The purpose of the *HCA* is to encourage and facilitate the protection and conservation of heritage property in British Columbia.

In Australia, the move to legally protect Indigenous archaeological sites came much later with most states introducing "relics" legislation during the 1960s and 1970s. Examples include Queensland's *Aboriginal Relics Preservation Act* of 1967 and Victoria's *Archaeological and Aboriginal Relics Preservation Act* 1972. While in the USA the *Antiquities Act* only applied to sites on federal lands, "relics" legislation in Australia applied to both public and private lands, with all archaeological sites and objects considered property of the Crown. The most obvious spin-off of the new legislation was the efflorescence of the cultural resource management (CRM) industry in the 1970s. CRM brought into sharp focus the view that the significance of archaeological sites was based primarily on notions of representativeness and archaeological research value in terms of sites as repositories of prehistoric data. Most archaeologists agreed that CRM was a positive move for site preservation (Smith 2004).

For many First Nations, Native Americans, and Aboriginal Australians, development of the CRM industry brought to a head the sense of marginalization created by archaeology's legislative and scholarly advances during the twentieth century. Such marginalization, as a further dimension of

colonial disassociation and appropriation, was expressed on four fronts. First, legal protection and excavation of sites were aimed at creating a cultural history for the benefit of White settlers. Second, Indigenous people had little or no say in the processes of archaeological research on their ancestral remains and little or no rights to veto what they considered to be inappropriate research. Third, couching cultural sites in terms of archaeological sites and relics was limited as it not only ignored other types of cultural sites (e.g., places of spiritual significance without archaeological remains), but it also implied that real Indigenous culture belonged to a dead past. Fourth, Indigenous people considered it inappropriate that the cultural heritage significance of Indigenous sites identified through the CRM process was assessed simply on scientific grounds without consideration of Indigenous cultural values. Many Indigenous peoples felt that non-Indigenous control and management of these cultural sites was based not on cultural right but on colonial might. The message was clear – archaeologists rather than Indigenous peoples were the appropriate stewards of the Indigenous past (Nicholas and Hollowell 2007).

Issues of marginalization and appropriation came to a head in the 1970s with debates over "who controls the past?" and "who owns the past?" (McBryde 1985). Many Indigenous communities in the North America and Australia demanded the return of ancestral remains and sacred objects held by museums as a counter-hegemonic and anticolonial strategy to reassert ownership and control of their past and heritage. The repatriation debate resulted in much soul-searching among archaeological and museum communities. Initially, Indigenous calls for ownership and control of ancestral sites and remains met with considerable resistance from archaeologists. Many archaeologists felt that the scientific integrity of their research would be jeopardized if Indigenous peoples dictated and censored research agendas and research results.

A watershed in the evolving debate over Australian Aboriginal control of archaeological sites and research arrived at the 1982 annual meeting and conference of the Australian Archaeological Association Inc. (AAA) held in Hobart, Tasmania. Present was Ros Langford, who on behalf of the Tasmanian Aboriginal community delivered a paradigm-challenging paper with a blunt message: "We say that it is our past, our culture and heritage, and forms part of our present life. As such it is ours to control and it is ours to share on our terms. That is the Central Issue of the debate." After considerable discussion, AAA passed a motion declaring that "This conference acknowledges Aboriginal ownership of their heritage. Accordingly, this conference calls on all archaeologists to obtain permission from Aboriginal owners prior to any research or excavation of Aboriginal sites." While during the 1980s most Australian archaeologists and CRM consultants took Indigenous permission as a given, it was not until the early 1990s that such values were enshrined in the AAA Code of Ethics. Similarly, the Canadian Archaeological Association's Statement of Principles for Ethical Conduct Pertaining to Aboriginal Peoples of 1996 fully acknowledges the need for meaningful engagement and involvement of First Nations peoples in archaeological research (McNiven and Russell 2005: Chap 6). In contrast, the Society for American Archaeology's (SAA) eight Principles of Archaeological Ethics in 1996 make no mention of Native American ownership of archaeological sites. Internationally, the World Archaeological Congress First Code of Ethics, exemplified in Point 4, states: *To acknowledge that the important relationship between indigenous peoples and their cultural heritage exists irrespective of legal ownership.*

For many Indigenous peoples in settler-colonial contexts such as the USA, Canada, and Australia, security in controlling the destiny and management of their cultural heritage sites and objects is assured only after it becomes legislatively mandated. In the USA, among the legislative turning points were the *American Indian Religious Freedom Act* of 1978 and the *Native American Graves Protection and Repatriation Act* of 1990 (NAGPRA). The upshot of this legislation was that Native American tribes were to be given back human remains and associated funerary objects and other sacred objects held by federally funded institutions. In the case of ancestral remains returned for reburial, repatriation was

linked directly to land and cultural site management. In a related sense, the *Tribal Self-Governance Act* of 1994 provided opportunities for Native American communities to compel federal agencies to enter into co-management arrangements for federally owned public lands as a dimension of self-determination. Thus, the issues of Native Americans regaining religious freedom and control of cultural objects immediately reframed cultural heritage management as a dimension of land management. In short, the Indigenous cultural value and significance of objects and sites (including archaeological sites) could only be realized when set within their appropriate landscape context (Swidler et al. 1997; Watkins 2000).

In Canada, Aboriginal affairs and Aboriginal rights are a federal responsibility governed under the *Indian Act* (1876). This act enabled the forced removal of Indigenous peoples from their land and heritage, outlawed cultural practices and customs, and forced children into residential schools to assimilate into settler society. The Canadian federal government is starting to take responsibility by acknowledging the past through the truth and reconciliation commission and publishing multiple reports (http://www.trc.ca/websites/trcinstitution/index.php?p=890), including 94 *Calls to Action* (http://www.trc.ca/websites/trcinstitution/File/2015/Findings/Calls_to_Action_English2.pdf) to redress the legacy of residential schools and advance the process of Canadian reconciliation. Heritage is mentioned in Point 79 but largely to integrate Indigenous history, values, and memory practices into Canada's national heritage and history. The recent Canadian Supreme Court decision *Tsilhqot'in Nation v. British Columbia* (2014 SCC 44) established a precedent for the establishment of Aboriginal title on unceded land, without the requirement of a treaty. This decision has yet to be fully understood but could lead to significant changes in archaeological practice in British Columbia.

In Australia, the legislative push that gave Indigenous peoples greater say in the management and protection of their cultural heritage sites and places similarly came from the federal government. The *Aboriginal and Torres Strait Islander Heritage Protection Act 1984* provided a process whereby Indigenous people could apply to the Australian government to protect threatened sites and places of traditional significance irrespective of whether or not they exhibited archaeological evidence or were located on public or private land. A decade later, the passing of the historic *Native Title Act* of 1993 created a situation where government agencies and land developers (particularly mining companies) are obliged to negotiate with local Indigenous communities to determine mutually agreeable strategies to manage Indigenous cultural heritage sites and places on public (Crown) land (Lilley 2007; McGrath 2016).

Thus, one of the more important outcomes of federal legislation in Australia and the USA has been an expanded understanding of Indigenous cultural heritage sites and places as a dimension of a more holistic approach to landscape and environmental management. Important consequences of these changes for government authorities were that Indigenous cultural site protection and management not only required a broadened landscape perspective but also necessitated the employment of Indigenous peoples in cultural heritage and environmental management agencies. In short, Indigenous cultural sites could no longer simply be seen as geographical isolates and repositories of scientifically important (archaeological) data. Rather, the cultural importance of such sites centered on their capacity to define and help conceptualize the geographical and spiritual word and landscape of living Indigenous communities. Thus, archaeological sites reconceptualized as cultural heritage places beseeched the meaningful incorporation of Indigenous landscape management values and practices (Nicholas 2017; Swidler et al. 1997; Ucko and Layton 1999).

Current Debates

Reconceptualizing archaeological sites as cultural heritage places represented an important anti-colonial step whereby Indigenous peoples regained better control of their lives. In a practical

sense, this development has provided opportunities for Indigenous communities to be considered as stakeholders in cultural site and land management practices. In Australia, the stakeholder model has seen Aboriginal communities become senior advisors and co-managers of numerous national parks and World Heritage areas such as Mungo National Park, Kakadu National Park, and Uluru-Kata Tjuta National Park. In other contexts where Indigenous communities own lands and seas, the Australian government has provided support and funding for the establishment of Indigenous Protected Areas whereby protection of cultural and natural places, including archaeological sites, centers on Indigenous values managed by Indigenous rangers. In the USA, similar examples of co-management of national parks well known for archaeological sites include Canyon de Chelly National Monument in Arizona. In other cases, parks fall within tribally owned lands and are managed by Native American communities. Examples include Monument Valley Navajo Tribal Park in Arizona and Utah and the Santa Clara Pueblo and the Puye Cliff Dwellings in New Mexico.

First Nations of Canada have declared culturally important areas within their traditional territories as tribal parks. Tribal park designation ensures that lands, resources, and archaeological resources are protected and managed according to First Nation's visions and preferences. These areas are designed to protect traditional values in a modern context. It may also offer protection of natural resources and implement restrictions on access and/or visitation guidelines and resource extraction. In 1984, Tla-o-qui-aht First Nation in Clayoquot Sound designated Meares Island a tribal park to protect it from clear-cut logging. In 2009, they continued to establish more tribal park projects working with Parks Canada. In 1987, the Nlaka'pamux declared the Stein Valley as the Nlaka'pamux Tribal Heritage Park to protect its old growth forests; it has since been designated a Class A provincial park. Recently in 2014, the Tsilhqot'in National Government established the Dasiqox Tribal Park to manage the sustainability of the ecosystems necessary to support their Aboriginal rights. Although tribal parks exist, the term "tribal park" is not recognized legally in either provincial or federal jurisdictions in Canada. This term or the designation tribal park is not present on either the BC or federal government websites (Paquet 2013:3). Tribal parks have largely come into existence via negotiation spurred by protests. This has led to land resource management plans and negotiations over use between First Nations and provincial governments.

Co-management of World Heritage areas introduces a number of broader philosophical issues beyond those associated with equitable power-sharing arrangements. For a site or place to be included on the World Heritage list, it must be of "outstanding universal value" and meet at least one out of ten selection criteria. Some Indigenous communities believe that the notion of world significance is part of a colonial meta-narrative whereby Indigenous cultural sites and places are appropriated and ranked into a universal human history of Western construction. Such issues came to a head in Australia in the 1990s when scientific arguments for the world significance of certain Aboriginal cultural remains and artifacts attempted (unsuccessfully) to override local Aboriginal cultural values. Examples include the repatriation of the Kow Swamp Pleistocene human remains held by the Museum of Victoria to the Yorta Yorta Aboriginal community and the return of rare Pleistocene occupation deposits from southwest Tasmania held by La Trobe University to the Tasmanian Aboriginal community (Smith 2004; McNiven and Russell 2005: Chap 7). Yet in 2011 the Gunditjmara people of western Victoria commenced negotiations with state and federal government agencies to have the Budj Bim cultural landscape which contains complex eel trapping and aquaculture structures dating back at least 6600 years nominated for World Heritage listing. In 2017 the Australian government put forward the Budj Bim cultural landscape for inclusion on UNESCO's World Heritage tentative list. Clearly, different Indigenous communities see different values and opportunities with the World Heritage convention and the notions of world significance. Arguably the critical point of difference in acceptance or nonacceptance is whether the engagement process is proactive or reactive, respectively.

Future Directions

Many Indigenous communities see co-management of lands and cultural sites as simply a step toward the larger goal of cultural heritage autonomy. While the past century has seen Indigenous peoples make important anticolonial advances in regaining control and ownership of their cultural heritage sites and places, it is equally true that economic problems and poor resourcing often limit the potential of advances to be realized and put into practice. Lack of economic independence ensures that the degree of control many Indigenous communities have over their cultural sites and places is conditional on government funding or development capitalism. Clearly, cultural heritage autonomy for Indigenous communities is closely linked to economic independence. The postcolonial challenge for settler-colonial nation states such as the USA, Canada, and Australia will be accommodating Indigenous cultural heritage autonomy and replacing the colonial fantasy of a single national heritage with plural and polyvocal heritages featuring cultural sites, places, and objects that are shared and not shared.

Cultural Heritage Management Quality Control and Assurance

Diane Lorraine Douglas
Environmental Business Unit, Sustainability Pty Ltd, Scottsdale, AZ, USA

Introduction

This entry briefly summarizes how quality control (QC) and quality assurance (QA) protocols and procedures came to be implemented in archaeology as a means of managing cultural heritage resources. This entry reviews how laws protecting cultural heritage resources led to the development of commercial archaeology in the 1970s and 1980s. With the advent of commercial archaeology, leading practitioners established best practices standards that were designed to ensure that archaeological sites were investigated and documented by qualified archaeologists. An integral component of best practices in archaeology is the implementation of QC/QA on all aspects of a project.

Definition

QC refers to the process implemented by a company or organization to ensure that standards are in place to ensure production of a quality project or service: This includes providing training for management and staff, providing software programs and equipment that facilitate provision of quality products and services, and establishing a culture of quality service within the organization. QA refers to programs that are established by companies or organizations to conduct systematic monitoring and evaluation of processes that are undertaken to complete a project, or provide a service, to ensure that their standards of quality are being attained.

Key Issues/Current Debates/Future Directions/Examples

Professional archaeologists have always been concerned about the quality of their work and the accuracy of their interpretations of the material remains left by past civilizations. With the advent of commercial archaeology in the 1970s to 1980s, however, archaeological investigations started being undertaken for profit and a new breed of archaeologists was born (Willems and van den Dries 2007a). In some instances, the desire to make a profit outshined the desire to perform quality research and archaeological resources suffered (Willems and van den Dries 2007a). Oddly, commercial archaeology started being practiced in many countries following the establishment of

laws that required infrastructure and development projects to consider the potential impact of their project on cultural heritage resources. These same laws, though designed to protect cultural heritage resources, in many instances resulted in a poor level of work being performed because either no professional standards were required (Willems and van den Dries 2007a, b), or if they were required, they were not enforced (Willems and van den Dries 2007a, b).

Laws to protect archaeology sites from impacts associated with development were first established in the United States, but other countries soon followed suit (Willems and van den Dries 2007a). Although the agencies that established these laws promulgated standards (i.e., 36 CFR Section 61 of the National Historic Preservation Act of 1966, 16; U.S.C. 470 et. seq., as amended; and Council of Europe 1969), it soon became apparent to the archaeology community that there was a need to establish a system of accountability among archaeologists practicing Cultural Resource Management (CRM) (Archaeological Institute of America 1994, as amended; Lyons et al. 1996; Lynott 1997; Adams 1997; European Association of Archaeologists 1998; Willems and van den Dries 2007a, b; Willems 2008).

In many countries, professional archaeologists banded together and created professional organizations that detailed educational and performance standards that must be met by its members (Table 1). Table 1 lists professional archaeology organizations that stipulate a code of ethics, minimum standards of education, training, and work performance to which their members must comply. These member organizations provide a valuable service to CRM by requiring members to apply professional standards in commercial archaeological investigations. In the United States, federal agencies require archaeologists who supervise archaeology work on federal lands, or federally funded projects, to be registered with the Register of Professional Archaeologists (RPA). The RPA reviews the work of registered archaeologists if they are reported as performing work that does not meet the standards of the RPA – in essence providing QC/QA of the work performed by its members. Nonetheless, it is difficult for a professional organization to ensure that its members conduct CRM at a level that meets the standards stipulated by the organization. One means of ensuring that CRM companies are performing work at the standards outlined by professional member organizations is to encourage companies to become accredited in International Standardization Organization (ISO) 90,001 QC/QA management systems.

Cultural Heritage Management Quality Control and Assurance, Table 1 Archaeology organizations with professional standards and a code of ethics

Acronym	Organization
ACRA	American Cultural Resources Association
AIA	Archaeological Institute of America
AAA	Australian Archaeological Association
ASAPA	Association for Southern African Professional Archaeologists
CAA	Canadian Archaeological Association
EAA	European Association of Archaeologists
IAFA	Irish Association of Professional Archaeologists
IAI	Institute of Archaeologists of Ireland
ICOMOS	International Council on Monuments and Sites
ICOMOS/ ICAHM	ICOMOS/International Scientific Committee on Archaeological Heritage Management (ICAHM)
IFA	Institute for Archaeologists
RPA	Register of Professional Archaeologists
SAA	Society for American Archaeology
SAFA	Society of Africanist Archaeologists

Adopting ISO Standards in Archaeology

The ISO became established during World War II out of a need for ensuring an acceptable level of quality in the mass production of equipment and materials needed for war. Since 1947, the ISO has developed several programs to help organizations establish management systems and operations that help ensure provision of quality services and products. If an organization is ISO certified, it is recognized by other organizations and agencies as

providing QC/QA on the work it performs. According to ISO 9001:2000, an organization meets the specific requirements for a quality management system by:

- Demonstrating its ability to consistently provide product that meets customer and applicable regulatory requirements
- Enhancing customer satisfaction through the effective application of the system, including processes for continual improvement of the system through auditing and adjusting the system to eliminate or minimize problem areas
- The assurance of conformity to customer and applicable regulatory requirements

By adopting the ISO 9001 QC/QA management system, an archaeology compliance company would ensure that the work it performed met national and international performance standards (i.e., Valletta Convention 1992). By integrating ISO 90001 QC/QA systems in all phases of an archaeological project, consultants can assure agencies, clients, and the public that the cultural heritage resources they are investigating are managed with the highest standard of care.

Integrated QC/QA in CRM

The information derived from archaeological investigations is largely dependent upon the questions posed during the proposal writing, or scoping phase of a project. Expertise is required to formulate the right questions to determine the scope of work required for a project. Accordingly, a system of QC/QA should be employed during the scoping phase. One or more archaeologists with considerable experience working in the geographic region where a project is proposed should critique the scope of work before it is submitted to a client or agency for consideration. This experience is needed to determine:

- What information should be reviewed (archives, maps, literature) to learn as much about the cultural history and archaeology of the project area as possible before field work is conducted
- The appropriate survey methods to be implemented (e.g., systematic transects versus shovel probes)
- How to document artifacts and features identified on the survey
- Mapping techniques to use
- Whether buried archaeological resources might be present

If buried archaeological resources are present:

- How to conduct test excavations, trenching, and stripping of the ground surface to expose buried cultural features
- How to sample an archaeological site through excavations to optimize the information that can be derived from these excavations
- The types of analysis that may be required (lithics, ceramics, fauna, flora, etc.)
- How to establish a date for the periods of occupation at the site
- How to reconstruct the environment that existed when the site was occupied
- What stakeholders and community members should be consulted

Another integral part of the scoping phase is determining who should conduct the investigations (from archival research, to specialists such as geomorphologists). Additionally, understanding the project needs facilitates developing an accurate schedule and budget for a project. A good way of assuring your project will stay on time and on budget as well as meet national/international best practices is by having a qualified archaeologist peer-review the proposal – a critical first step in implementing a successful QC/QA management system.

Beyond Project Scoping

Correctly scoping and costing a project can be critical to project success, but several other steps are also required in an integrated QC/QA management system. Whenever feasible, one or more senior qualified archaeologists should provide oversight of all stages of a commercial

archaeological project. Independent peer review of the project proposal, work plans, and deliverables by one or more professional archaeologists provides a further step in achieving good QC/QA practices in archaeology.

Other important elements for ensuring quality performance on a project include consultation with stakeholders, including groups or individuals who may have some knowledge of the historical occupation of a site, or have traditional ties to the site or to the landscape, and using a good database, project management software, and cost-tracking software.

Stakeholder Consultation

Inadequate consultation with stakeholders can result in the failure of a project. Stakeholders often have political and/or social power and can influence whether a project moves forward or is shut down. Correspondingly, establishing policies, protocols, and procedures for conducting stakeholder consultation is important for the success of archaeological investigations. The Warkworth Sands Excavation Project (WSE), undertaken in Australia by Rio Tinto Coal, Scarp Archaeology, and the Upper Hunter Valley Aboriginal Cultural Heritage Working Group (CHWG), provides an excellent example of a good stakeholder consultation program. Rio Tinto Coal has a suite of comprehensive Aboriginal cultural heritage management policies, protocols, and procedures (Godwin 2010). Since 2005, Rio Tinto has been working with the CHWG to obtain their input on archaeological investigations undertaken in the Upper Hunter Valley. The WSE was a large-scale and technically complex project that was successfully planned and implemented in the heart of an operational mine. The excavation of four 25 m^2 test pits up to 3 m in depth was undertaken by hand over an 8-week period. Although Rio Tinto archaeologists supervised the excavations, the CHWG actually performed the excavations, supported by a wide variety of technical specialists (e.g., ground-penetrating radar and geomorphology). By following their stakeholder consultation policies, Rio Tinto successfully completed the project on time and on budget, and helped train Aborigines in archaeological best practices, which has contributed to maintaining a good working relationship with the CHWG (Klar 2008).

Database Programs

Accurately tracking the provenience of cultural horizons and associated artifacts, fauna, and other samples collected during archaeological investigations is important for ensuring reliable interpretation of these data. To help ensure the accurate tracking of this information, it is critical to employ a good relational database and stringent QC/QA on data entry. How to set up a database is beyond the scope of this section. However, it is important to note that a qualified archaeologist should be involved in the database design to ensure the right variables are entered to enable statistical analyses. Data entry should be cross-checked and verified frequently to help minimize key-stroke errors, or miss-entry in specific data fields. Microsoft Access is one of the most common databases used in archaeology.

Improving the capabilities of a database is an iterative process that requires reviewing input variables to determine their adequacy for the types of analyses needed for a project, or for a future project. By continually refining a database, archaeologists can continue to improve their interpretations of the cultural resources being investigated.

Management Software

Microsoft Project, Quitiq, and Attask are scheduling software programs that facilitate tracking project tasks, milestone due dates, and meetings, and help identify whether additional staff is needed for a specific task or additional equipment needs to be purchased (Fig. 1). Utilizing these types of software programs makes it easier for project managers to identify potential problems meeting the project schedule. By identifying

ID	Task Name	Duration	Predecessors
1	**Software Project**	**172.5 days**	
2	Requirements	7 wks	
3	Design	5 wks	2
4	**Programming**	**60 days**	**3**
5	Unit Tests for Feature A	3 wks	3
6	Program Feature A	7 wks	5
7	Unit Tests for Feature B	4 wks	3
8	Program Feature B	8 wks	7
9	Feature-Complete Build	0 days	6,8
10	**Test Preparation**	**40 days**	
11	Build Test Plans	6 wks	2,3FF
12	Review, Correct Test Plans	2 wks	11

14	Execute Test Plan A	3 wks	9
15	Execute Test Plan B	1.5 wks	14SS
16	Fix Defects	1 wk	14,15
17	Regress Test Plan A	6.5 wks	16
18	Regress Test Plan B	3 wks	17SS
19	Deliver Beta Build	0 days	17,18

Cultural Heritage Management Quality Control and Assurance, Fig. 1 A sample schedule for tracking tasks and resources for a project

scheduling problems early, managers can either juggle tasks to meet the schedule requirements, or inform the client that a due date cannot be met and request an extension. Closely managing a project schedule can help minimize missing important meetings and due dates, and providing clients with an early warning of problems meeting the schedule can enhance consultant-client relationships. This process can also help managers develop more realistic schedules for future projects.

Cost-Tracking Software

Accurately costing a project during the scoping phase is extremely important for completing a project within the approved budget. Equally important is the need to track a project budget during all phases of the work that is being performed. Typically, on any archaeology project, several people can be involved in performing the work. Although each of these individuals may be assigned a certain number of hours to perform a task, individuals may go over their approved hours without informing the project manager.

To circumvent potentially going overbudget as a result of individuals charging too much time to a project, cost-tracking software should be utilized. These programs are utilized for tracking the number of hours each person charges on a weekly basis, and provides an analysis of the percent complete (hours charged relative to the number of hours assigned for a particular task). Weekly analysis of a project budget can help managers determine whether a specific task is nearly overbudget. This provides the manager with an opportunity to determine whether an adjustment needs to be made to the level of effort undertaken to complete a particular task or request additional funding from the client. As with scheduling, providing clients with an early warning of problems

can enhance consultant-client relationships. The budget review process can also help managers develop more accurate budgets on future projects.

Cost-tracking software can be proprietary or purchased. Common cost-tracking programs include: Attask, EcoSys – Enterprise, Kronos, and Replicon. In addition to provide a means of tracking hours, these software programs can track project expenses and provide up-to-date summaries of budget status.

Bringing It All Together

An example of how a comprehensive QC/QA management system works in CRM can best be illustrated by a brief summary of the QC/QA management system practiced by Statistical Research Inc. (SRI). SRI is one of the largest heritage management companies in the world and has an outstanding reputation with its clients and agencies for the quality of work it performs. This reputation by and large can be attributed to the company's implementation of an integrated QC/QA management system, from the point of careful hiring and training of staff in SRI procedures, to the submittal of reports to clients and agencies. Senior archaeologists (Ph.D. plus 15 or more years of experience) provide internal review during all project phases, from scoping and costing a project, to analysis and report writing. Quality control is further facilitated through use of SRI's proprietary database (SRID) and budget-tracking software (NAVISION).

An example of how SRI's integrated QC/QA management system results in high-quality archaeological investigations and project reports is exemplified in the Joint Courts Complex Archaeological Project (JCC Project). The JCC Project was undertaken in Tucson, Arizona, and entailed the excavation of a 4.3-acre parcel located in the downtown area of the city that contained a large historical-period cemetery dating from the 1860s to 1881. Nearly 1400 individuals were recovered, and these remains and associated burial objects were either repatriated or reburied in a specially designated area in a local cemetery. The project required mitigation of all prehistoric and historical-period cultural resources within the land parcel, including Middle and Late Archaic features, Formative period artifact scatters, and a large late-nineteenth- and twentieth-century urban residential and commercial components. The JCC Project was undertaken by SRI from 2006 to 2010, and required the work of qualified specialists that included historians, historical archaeologists, geoarchaeologists, GIS experts, osteologists, 3-D scanning specialists, and public outreach and public relations consultants. The work performed by these specialists was overseen by a QC/QA team that routinely reviewed all work being performed in the field, as well as analysis and report writing. The QC/QA team also provided support for the extensive stakeholder consultation performed for the project. Consultation was undertaken with various groups who had ties to the site, including claimants for the historical-period human remains that were excavated. All project data and non-burial-associated artifacts and samples were curated at an approved facility in Tucson, Arizona.

SRI used Microsoft Project to track the progress of the project over its 4-year duration, and Navision data allowed detailed analysis of staff time expended by task. SRID was used to track all excavations including individual grave excavations, to provide the client, Pima County, with weekly completion reports and a dynamic map of the project area that reflected progress. SRID links multiple data categories – discovery units, features, proveniences, artifact collections, osteological remains, and on-site storage locations – in a single database that manages data from discovery to final curation. This was essential for QC/QA at JCC, where SRI recovered 37,000 different artifact collections from 30,000 proveniences and 1900 features. The budget for the project was approximately 15 million USD (included fee for demolition contractors), and the work was completed on time and on budget. The project was reported in 2010 in a four-volume report series (Gray and Swope 2010; Hall et al. 2010; Heilen and Gray 2010). SRI QC/QA procedures were used during all phases of the project, ensuring the work was performed at the highest standard of professionalism and the reports

provide an accurate interpretation of this time period in Tucson's history.

Conclusion

Implementing a QC/QA management system in CRM can circumvent multiple types of problems that can otherwise occur, ranging from budget and schedule overruns, to misinterpreting important elements of a cultural heritage resource site. By implementing a management system that replicates ISO 9001, such as the system employed by SRI, or by becoming ISO accredited, CRM companies can better assure that they are recognized as providing a quality service. Further, the general reputation of CRM could be improved among academic archaeologists. More CRM companies would be accepted as professionals making an important contribution to the archaeological literature and to the public understanding of the past.

Cultural Heritage Management Technology and Training

Kirk A. Cordell
National Center for Preservation Technology and Training, U.S. National Park Service, Natchitoches, LA, USA

Introduction

Understanding and applying appropriate technologies to the preservation and treatment of cultural heritage has been a hallmark of good resource management since the earliest days of the conservation and preservation movements. It is important to know the traditional technologies or trade practices used to create a site, structure, or object in order to understand the integrity of the resource and the mechanics of its deterioration over time. Understanding modern technologies as they are applied to cultural heritage is critical as well, for it is impossible to make responsible decisions regarding evaluation and treatment until the immediate and long-term effects of the proposed technology are understood and accounted for. Technology is itself a critical component of the scrape/anti-scrape debate which arose early in the modern preservation movement, since some technologies, e.g., nondestructive evaluation techniques, are inherently more suitable to the preservation of the original fabric of the resource than others. The rise of the modern conservation/preservation ethic in the late eighteenth and nineteenth centuries coincided with the rise of the industrial revolution in Europe and then the rest of the world, so that the technologies available to create heritage resources were constantly shifting, as were the techniques available to study and treat them. Even in the field of archaeology, where most of the resources arguably already existed by this time, the growth of technologies to identify, unearth, and treat artifacts continued to shift constantly.

Key Issues/Current Debates

Those with an avid interest in the past have naturally been more interested in traditional technologies than in modern ones, but as the modern preservation movement "grew up" in the twentieth century almost every ministry of culture or other national conservation organization around the globe included a laboratory for the study of historic materials and modern treatment alternatives. The deepening interest in scientific and technical solutions was one driver behind an international meeting of "architects and technicians of historic monuments" held in 1931 in Athens. Their resolutions, which became known as the *Athens Charter*, recommended in part that "architects and curators of monuments should collaborate with specialists in the physical, chemical, and natural sciences with a view to determining the methods to be adopted in specific cases" (Athens Charter 1931). In the wake of two World Wars that devastated resources around the globe, an increasing awareness grew among those that were responsible for cultural heritage management that more needed to be done to share knowledge and expertise, both in the approaches to and the technology of preservation. In 1956, the Ninth General Conference of the United Nations Educational, Scientific, and Cultural Organization (UNESCO) (see the entry on UNESCO-ICOMOS-ICAHM and Other Relevant Scientific Committees in this encyclopedia) recommended the creation of "an intergovernmental center for the study and improvement of methods of restoration," resulting in the founding of the International Centre for the Study of the Preservation and Restoration of Cultural Property (ICCROM) in 1959 in Rome (ICCROM 2005). ICCROM included a strong technical bent from its founding, as well as a commitment to training practitioners from around the globe. For more than 50 years, it has brought together, among others, experts in the technologies of preservation and conservation and has helped to build the technical capacities of agencies and organizations worldwide.

As international interest in cultural heritage continued to grow, a congress of architects and historic building specialists (which, like the meeting in Athens three decades earlier, included leading field and academic archaeologists) was held in Venice in 1964. It adopted a number of resolutions, the first of which came to be known as the *Venice Charter*. The *Charter's* second article stated that "[t]he conservation and restoration of monuments must have recourse to all the sciences and techniques which can contribute to the study and safeguarding of the architectural heritage" (Venice Charter 1964), recognizing the importance of technologies new and old to the preservation of historic resources. The congress also adopted a number of other recommendations, including one put forward by UNESCO that recommended the creation of the International Council on Monuments and Sites (ICOMOS) as a nongovernmental institution within UNESCO, supported by a network of national committees in participating nations (ICOMOS 2011). ICOMOS was founded immediately and headquartered in Paris, and had among its goals the research and dissemination of techniques for preserving buildings and sites, and the training of specialists to undertake such work (ICOMOS Statutes 1978).

The passage of the Venice Charter and the call for the creation of ICOMOS inspired additional attention to preservation around the world and with it an emphasis on understanding and applying appropriate technologies to preservation problems. In the USA, James Marston Fitch established the first masters level program in historic preservation at Columbia University in 1964, with an emphasis on materials analysis and traditional technologies that was shared by only a few of the collegiate programs that blossomed in the USA in the ensuing years. The passage of the National Historic Preservation Act in the USA in 1966 (NHPA as amended 1966) established a broad federal preservation program and created overnight a market for contract archaeology to clear federally funded projects for development. The demand for additional tools to quickly identify the presence of archeological resources

stimulated research into the application and efficacy of various prospection or remote sensing techniques and the search for new technologies for nondestructive evaluation of archeological sites.

The perceived need for a better understanding of the technologies involved in preservation practice in North America led to the establishment of the Association for Preservation Technology International (APT) in Canada in 1968 (APT 2012). APT began and operated for many years as a joint US/Canadian professional organization dedicated to the cross-disciplinary exploration of the technologies involved in preserving cultural heritage. In recent years, APT has added chapters in several other countries and has become more truly international in scope. While APT tended to focus on the built environment, conservators in the USA who dealt primarily with museum collections and other cultural objects founded the American Institute for Conservation of Historic and Artistic Works (AIC) in 1972 (AIC 2012). Over the last 40 years, AIC has established specialty groups (10 in all) dedicated to topics from architecture to painting to wooden artifacts. Annual meetings of both APT and AIC have become internationally recognized sources for the latest research on cultural heritage technology and training and frequently attract papers and sessions from experts around the world. Other significant organizations devoted to objects and collection conservation were also created at this time, including the Smithsonian's Conservation Research Laboratory (now the Museum Conservation Institute) in 1963 (MCI n.d.) and the Canadian Conservation Institute in 1972 (CCI 2011).

UNESCO stepped back onto the world stage of cultural heritage technology and training with the establishment of the World Heritage Convention in 1972. While the primary thrust of the convention was to encourage signatory states to identify and protect their own heritage resources and to recognize the value to all humanity of the premier resources in other countries, it also addressed technology and training needs. Article 5.3 of the convention encourages the State parties "to develop scientific and technical studies and research and to work out such operating methods as will make the State capable of counteracting the dangers that threaten its cultural or natural heritage," while Article 5.5 suggests that they "...foster the establishment or development of national or regional centres for training in the protection, conservation and presentation of the cultural and natural heritage and to encourage scientific research in this field" (UNESCO 1972). Many countries responded by incorporating an emphasis on scientific and technical research and training into their national heritage agencies. In the USA, the National Park Service (USNPS) created a Technical Preservation Services unit within its Office of Archaeology & Historic Preservation about this time, headed first by W. Brown Morton (author of the Secretary of the Interior's Standards for Rehabilitation) and shortly thereafter by Lee H. Nelson, who had overseen the restoration of Independence Hall in Philadelphia. TPS became the US government's loci of technical expertise in preservation and led the establishment of preservation standards for many types of heritage resources.

Over the next decade, the number of US universities offering graduate and undergraduate degrees in historic preservation ballooned, leading to the creation in 1985 of the National Council for Preservation Education. NCPE, as it became known, established the first national standards for preservation programs in the USA and specifically required that programs instruct students on the technological issues affecting historic building materials and systems (NCPE n.d.). That same year, the Getty Conservation Institute (GCI) was founded in Los Angeles, bringing together the financial resources of the Getty Trust and technical experts assembled from around the globe. GCI in the ensuing years has researched new and traditional technologies and supervised the restoration and documentation of world-renowned heritage resources in countries throughout the world. GCI, like APT and AIC, publishes original research on technical issues and produces training materials for heritage resource managers (GCI 2009).

By 1986, the burgeoning interest in the technologies of heritage management and the perceived need for specialized training found its way into the halls of the US congress. Congress

had requested that its Office of Technology Assessment (OTA), which advised the relevant committees on science and technology issues in many areas (including space and nuclear policy), examine the US historic preservation program and make recommendations for improving the management of heritage resources in the USA. OTA responded by holding a series of expert panels around the country focused on different disciplines within the field (e.g., archaeology, historic landscapes, historic structures, etc.). Its conclusions and recommendations were presented to congress in a 1986 report, *Technologies for Prehistoric and Historic Preservation*. Though the report made a number of suggestions for improving the federal preservation estate, one was of special interest to NPS: that congress establish a research and training center specifically devoted to the transfer of technology from other fields into heritage management. It further recommended that the new center be established within the Department of the Interior (parent agency of NPS) or as an independent entity managed by a consortium of universities (OTA 1986). Although the OTA report languished for several years after submittal to congress, NPS actively studied possible locations for it within NPS and eventually found a sponsor in J. Bennett Johnston, the senior senator from Louisiana. Johnston had a strong interest in preservation and proposed amendments to the National Historic Preservation Act that essentially created a hybrid of the two recommendations – a center that was part of the NPS but located at a University in Johnston's home district. With the passage of this legislation in 1992 (NHPA as amended 1966), the National Center for Preservation Technology and Training (NCPTT) was established in the USA on the campus of Northwestern State University in Natchitoches, LA, as a program of the National Park Service. Since that time, it has awarded over US $8 million in grants and funded research and training in most of the disciplines within heritage management.

While NCPTT remains somewhat singular in its dedication to technology and training in the heritage management field, government-sponsored and private cultural institutions around the globe have strengthened their expertise and commitment to technology issues in heritage management by establishing research laboratories and supporting research. English Heritage, Historic Scotland, and national agencies in France and Germany have joined multiple organizations in Italy (including ICCROM, which is still active in Rome) to strengthen understanding of heritage management technologies in Europe. Public and private groups in Australia, China, and India have also taken an interest, and organizations such as the World Monuments Fund, while not themselves focused on technology, have helped to bring technology experts to cultural crisis spots all over the world.

Future Directions

At the dawn of the twenty-first century, technology in the service of cultural heritage management is a blossoming field, and training programs that help to transfer technology to heritage managers are springing up everywhere. While traditional technologies, such as lime mortars and washes, lead and calcimine paint systems, and prehistoric ceramics continue to garner research interest and produce useful results, it is the technologies transferred from science, engineering, and medicine that are changing the face of cultural heritage management. Nondestructive evaluation techniques have been keenly sought for many years, since any excavation technique has the potential to damage the resourced. Many modern tools are available now to specialists and are increasingly becoming available to generalists. In archaeology, geophysical prospection technologies help locate subsurface cultural features. Magnetometry uses magnetic fields to detect changes in soil composition caused by human occupation; electrical resistivity and conductivity can detect changes in soil type and strata; ground penetrating radar (GPR) detects the echo of radio waves bouncing off buried features; and gradiometry uses a pair of magnetometers to measure minute differences in local magnetic fields and the earth's gravity. These instruments are becoming increasingly sophisticated in

sensitivity and simpler in application, so that they are more and more available to practicing archeologists. Laboratory techniques such as X-ray fluorescence (XRF) and reflectance transform imaging (RTI) are now portable enough to take into the field, where they can help identify the elemental composition of metals and ceramics or discern images that are not visible to the naked eye. Infrared thermal cameras are used, particularly from the air, to detect the presence of buried wall foundations and other features that store and release heat at a different rate than the surrounding soil.

Historic buildings and structures also benefit from a variety of nondestructive inspection techniques. Some of the technologies are simple, like fiber optic boroscopes that can peek inside wall cavities or moisture meters to check the water content of building materials. Some are borrowed from the archaeology toolbox; GPR, for example, is now used to find voids inside masonry walls or hidden changes in construction materials. Infrared thermography uses thermal cameras to pinpoint heat losses during energy audits of historic buildings or to identify moisture hidden inside walls because liquid water has a different thermal signature than surrounding dry materials. Resistance drilling can spot deterioration inside wood structural members by charting the change in resistance as a drill bit passes through softer, rotted wood. Radioactive sources and film have been used for many years to create X-ray images of hidden structural members and fasteners. More recently, digital radioscopy has been used to achieve the same ends by using electrically-induced X-rays and an image capture system to produce data in real time.

Materials conservators use many of these same technologies to look through object layers or capture views of hidden surfaces. Laboratory or portable XRF (pXRF) is used to identify the composition of substrates and surface deposits. Additional tools include Fourier transform infrared spectroscopy (FTIR) and Raman spectroscopy, which use infrared and laser light, respectively, to excite molecules and capture the elemental signatures that can help to identify unknown materials. Eddy current testing, borrowed from heavy industry, can be used to measure the microns-thin gilding of an antique bronze or to recover the lost hallmark on a well-polished teapot. Acoustic resonance technologies use sound to characterize materials; acoustic resonance microscopy, for example, can also be used to recover lost hallmarks.

Every technology used in other industries to characterize materials or look beneath the surface has the potential to be applied to the management of heritage resources. Cultural scientists continually search for new applications for old technologies and for new technologies to transfer from other areas of science, medicine, and industry. In the USA, NCPTT, APT, AIC, and other professional organizations continue to research and train heritage professionals in the application of these technologies. Worldwide, ICOMOS encourages collaborative research and information sharing across international boundaries through its expert committee system, and national ICOMOS organizations (such as USICOMOS) promote the sharing of data and exchanges between countries. In a world where technological innovation drives the economy and continually shapes culture, cultural heritage management will always be engaged in understanding new technologies and how they can best be used to preserve heritage.

Cultural Heritage Management: Building Bridges

Joëlle Clark[1] and Margaret Heath[2]
[1]Center for Science Teaching and Learning, Northern Arizona University, Flagstaff, AZ, USA
[2]Division of Education, Interpretation and Partnerships, Bureau of Land Management, Delores, CO, USA

Introduction

It is summer solstice 2009 at Yupqöyvi, the Hopi name for Chaco Culture National Historic Park in New Mexico, U.S.A. Just before the sun rises at around 5:30 AM, a group of Hopi youth and elders are already up and running to greet the sun so that the sun will not be burdened to carry them throughout the day. The group is visiting Yupqöyvi to learn from the traditions of their ancestors, the Hisatsinom, who left their *footprints* or archaeological sites to teach all Hopi generations the way to live. The trip is part of the *Footprints of the Ancestors* program, an intergenerational cultural preservation project designed to connect Hopi youth with their past. The elders teach the youth their language, values, and traditions. Archaeologists teach them how land use patterns change over time, specific types of artifacts that are associated with particular ancestral places, and regional cultural timelines. This program was developed collaboratively between the Hopi Tribe's Cultural Preservation Office and Northern Arizona University's Anthropology Department in response to a growing crisis of language and culture loss among Hopi youth. The *Footprints of the Ancestors* program is an example of building a bridge between indigenous communities and archaeologists to create cultural heritage education programs that allows youth to interact with elders, educators, archaeologists, and other professionals in meaningful ways in order to better understand and integrate their cultural heritage with their modern-day lives and future selves.

The initial idea for the *Footprints of the Ancestors* program was to teach archaeology, a scientific discipline, to Hopi youth. It was soon clear in collaborative community conversations that this one-way bridge would not work. A shared vision, respect, and understanding for the past from both Hopi cultural perspectives and scientific processes were needed. This goal of building true multiple-pathway bridges with communities for a common purpose is shared by many cultural heritage managers and educators.

Definition

Literally, a bridge is a structure that spans across some obstacle allowing for easier access and transport. In communication, a bridge often means the creation of shared understanding between individuals. For cultural heritage managers and educators, building bridges refers to the establishment of intentional structures (i.e., management policies, program designs, or advisory groups) and processes (i.e., collaborative meetings where dialogue occurs) between researchers, other professionals, and communities that allow for an exchange of ideas, cultural understanding, resources, and respect. In this way, archaeologists can learn about specific cultural heritage values and issues important to community groups and

communities can learn how archaeologists study the past and how their research complements (or not) community heritage values.

Some fundamental principles for building bridges are that they must be:

- Collaborative among all parties involved
- Respectful of community heritage values
- Reflective of quality research and best professional practices
- Comprehensive, integrative, and flexible

Because the "past" is a concept constructed by individuals who make meaning from objects and events, it is important to recognize that reconstructing the past is an academic, social, and cultural endeavor. For some, the past is meticulously and empirically analyzed and interpreted. For others, the past is intrinsically linked to both the present and the future. It cannot be separated and considered distinctly. Groups of people often place personal/emotional, scientific, economic, and cultural values on heritage places and the objects and stories related to them. Paying attention to community values, concerns, and needs has been part of public archaeology and education efforts for decades. However, when initiating or designing collaborative archaeology projects, it is critical to determine: How is heritage defined?; Whose heritage is being studied?; How is heritage being studied?; How is heritage being presented?; Who makes heritage decisions in various contexts (community level, academia, schools, museums, etc.)?; Are all heritage values included?

Examples

In the United States, the journey for building bridges in the context of education came from the Society for American Archaeology Public Education Committee (SAA/PEC). In 1995, SAA/PEC established a Native American Education Task Group whose charge was to build collaborative relationships with American Indian communities through educator workshops. The intent was to "build bridges" between archaeology (and archaeologists) and American Indians through classroom education. In order to do this, the group needed to demonstrate to indigenous educators how they could use archaeology education materials to develop and enhance their school curricula. The Task Group held workshops, professional development planning sessions, and retreats over the course of 7 years to help achieve their goal. The work of the SAA/PEC met with initial success. Teacher participants in the workshops discovered professional archaeologists were approaching their work with new attitudes that included not only studying archaeology using scientific methods, but also including interpretations from descendants' cultural stories and beliefs. After several years of conducting workshops, the SAA/PEC reassessed the strategy and concluded that the workshops were effective up to a certain point. Because of the national audience, the content tended to be focus on the locale where the workshop was held. Teachers were asking for materials and instruction that were tied to their own specific, local contexts. The group concluded that local context, cultural relevance, language, and community were integral to the success of any indigenous heritage education effort. The group changed focus to building two-way educational bridges with specific indigenous communities to better address local cultural issues and needs. The Hopi Footprints project is one example of this effort.

Another example is the revision of the curriculum materials and professional development used in the initial Native American Education Task Group workshops. The workshop materials were a set of archaeology lessons designed for students aged 9–13 from the Bureau of Land Management, Project Archaeology program. These materials, *Intrigue of the Past: Investigating Archaeology* (Smith et al. 1996), included American Indian perspectives in teaching archaeology. Although these materials are still widely used and effective, the Project Archaeology program decided to build new inquiry-based curricular materials. In the process, Project Archaeology staff invited American Indian educators help draft and review and new lessons. The American Indian educators suggested that a descendant be included in the curriculum to introduce his or her own

culture and to provide an oral history and contemporary cultural significance. This direct inclusion of native voices in educational materials represents a significant leap from using ethnographic resources written by nonnative scholars to using primary sources to present American Indian heritage values. In the new curriculum, *Project Archaeology: Investigating Shelter*, the combination of oral histories and accurate archaeological data allows students to draw their own conclusions about the meaning of the archaeological record, the heritage values it represents, and its significance in contemporary life.

In both examples, community partners share in the dialogue and are equal givers of knowledge in these cultural knowledge exchanges. This shift in the paradigm of how archaeology professionals and indigenous community members work together to build bridges provides opportunities for learning and teaching culturally relevant, scientifically accurate heritage histories.

Cultural Heritage Management: Business Aspects

Ian Baxter
School of Business, Leadership and Enterprise, University Campus Suffolk, Ipswich, Suffolk, UK

Introduction

Cultural heritage can be understood within a business context, in terms of an industrial sector comprising organizations working to supply products or services associated with the understanding, protection, and promotion of objects, sites,

monuments, and other forms of tangible and intangible cultural heritage. The business side of cultural heritage management can also be articulated within a service and experience economy as well as a policy context through activities such as tourism, where value may be understood in terms of market share, or as a sector which can have sets of values assigned to it.

Definition

Cultural heritage is recognized in many forms as having value, and the accordingly immediately implies a proposition of a particular type of value. Work in the first decade of the twenty-first century built on earlier work of David Throsby in cultural economics (updated in Throsby 2010), and a UK-based articulation of a threefold set of values in heritage, namely: intrinsic, instrumental and institutional, was seminal (Clark 2006). Cultural heritage therefore can be seen to have a set of intangible and tangible qualities that can be inherently appreciated; heritage can also do something within society; and heritage is articulated, marshaled, and treated in particular ways by organizations. This theoretical typology of value proposition allows for the objectification of something which we consider as heritage, and placing of it within a matrix of relationships and external pressures on it. Cultural heritage as object thus can only assert a value through identification of its proposition, and as such, it can be considered in its physicality as object, place, or commodity; historical reference point or evidence; or social identifier. The value proposition reinforces what the heritage is, how it should be perceived, and how forces can either act on it, or bestow the ability of actor for it. Any particular value proposition for heritage is laden with facets and symbolic meaning, and these may be both co- and multi-variant simultaneously through agency action. The very process of articulation of value is reliant on a set of management processes which categorize, compare, value, and position the heritage against a product or environmental set of circumstances. The business side of heritage management is therefore already implicit in any consideration of it, but may be considered in its explicit form also. A cultural heritage site can, for example, therefore be both sacred and commercial at the same time – a cathedral is a good example of this. The site may be operated commercially for tourists and as a center for religious practice and spirituality at the same time and by the same managing agency, using different functional and operative teams. The work of Dallen Timothy here, considering heritage tourism, is of particular importance (Timothy and Boyd 2002; Timothy 2011).

In following this argument therefore, the variance of action surrounding cultural heritage, the articulation of proposition for cultural heritage, and the functional operation of cultural heritage within different circumstances, means that the notion of agency itself must be considered. Agency can be most usefully understood in the context of thinking about cultural heritage management as business – whereby the business of managing cultural heritage creates value through a proposition which may have a monetary or non-monetary facet for both input and output. The context for the value proposition influences the type and level of investment required and return on investment in managing cultural heritage in a particular way. Cultural heritage may have money invested in it, but the return on that investment may be aesthetic improvement and welfare or higher educational attainment, rather than a quantifiable financial outturn – recent thinking by organizations, such as the New Economics Foundation and Demos (UK-based think tanks), ally this to a "Social Return on Investment" (SROI), and there are a number of techniques for analysis of this. Equally, an investment of volunteer time at a cultural heritage site may allow it to operate as a visitor attraction, and produce a direct financial return on a nonfinancial investment. Consideration of cultural heritage agency has both benefits and disbenefits, and it is important therefore to distinguish between an understanding of heritage as a business and the business of managing heritage. Cultural heritage as a business means that the organizational form that forms the agent needs to be identified: Often for cultural heritage these are charitable organizations such as a National Trust

or heritage/preservation foundation, or public/tax-payer-funded organizations such as Governmental cultural ministries and conservancies, national parks, and heritage services. There are also a group of commercial cultural heritage organizations, which may be private or share-holder governed enterprises, instrumentally using heritage as a positive economic generator in the service sector – often there are covariant commercial interests at play here forcing an interdependence between the preservation of the cultural heritage and that intrinsic value acting as a possible return on investment – and property investment companies are a good example of these where maintenance of a historic building through renovation can make it an attractive office rental proposition.

Key Issues/Current Debates/Future Directions/Examples

Cultural heritage as business requires the organizational structure such as those defined above to operate or act in a particular way, and in a particular business environment. The way of acting, and the environment in which agency occurs influence a cultural heritage organization's products, services, and by consequence benefits and customers as stakeholders in that benefit. The requirements of the cultural heritage sector produce a business environment large enough to sustain a wide variety of heritage "businesses" operating at a range of scales (economic and geographic). The business of managing cultural heritage should be understood through analysis of business and management operations – i.e., the actions and processes which contribute to the creation of the value proposition. Traditional management tools can be deployed to do this, such as environmental analysis using PESTEL technique (identifying political, economic, social, technological, environmental, and legal environments in which an organization is operating), strategic planning, and SWOT (strengths, weaknesses, opportunities, and threats) analysis of organizational capabilities. General strategic management texts, such as that by Johnson et al. (2010), introduce the major concepts which can be readily identified as contributing to the business of managing cultural heritage. Detailed aspects of management draw on the established field of operations management, the most developed form of which is seen in the applied management of heritage visitor attractions and the work of Swarbrooke (2001). Subject-specific academic studies of management and operations have been limited in number however, which is surprising given the organizational structures and capabilities for cultural heritage management agencies are so important, and for many organizations is a large and expensive operation in its own right. Most studies of this have been undertaken internally within the central administration of the organizations, to support the corporate and business planning function, and large organizations in the USA, such as the US National Parks Service, and the United Kingdom's National Trust (charity) and governmental heritage agencies have developed sophisticated internal mechanisms for setting strategic goals, deploying and generating resources. Many cultural heritage organizations throughout the world suffer from a management deficit however, and effective strategic planning and understanding of the role of management is underdeveloped. This is in part due to the inevitable tension between the perception of what management is and what effective management is trying to do, and against a global economic downturn, it remains unfortunate that the academic community has yet to engage fully with the intricacies of business operations in cultural heritage in as a sophisticated way as has happened with arts or museum organizations, where particular business functions (such as marketing) have an established stream of literature apart from the internal policy documentation. Good examples of these are seen in the works of Rentschler and Hede (2007) and Lord and Lord (2009). Where texts have been produced on heritage, (such as Waterton 2010, or Harrison 2012) they have tended to focus attention on policy issues associated with the application of management at sites, and may be considered as policy development critique and subject theoretical underpinning rather than a proper engagement with the business of heritage.

Where effective processes which an organization uses within the business planning function provide feedback, in turn they help form the future shape of the organization and its internal (and external) dynamic in order to produce effective "product" (conservation of the cultural heritage resource), develop a consumer or customer base (be it visitors or supporters of cultural heritage protection), and sustainability of both the resource and the managing agency responsible for it. This level of sophistication in business planning paves the way for organizations to engage in scenario planning or "futures" thinking, which is an important capability for dealing with "product" (i.e., cultural heritage resources) which are being preserved and potentially managed for an indeterminate period of time into the future. Scenario-based thinking is at an early stage of development within the cultural heritage sector generally, although development is being seen in Australia, Scandinavia, and the United Kingdom, where long-range planning within organizations is helping to determine new organizational forms and ways of thinking about internal organizational business structure and how it can support the wider mission to conserve the cultural heritage resource. The United Kingdom's largest conservation charity, the National Trust, for example, undertook a large-scale restructure between 2009 and 2011 to create internal business planning and consultancy units, aimed at driving efficiency within a large and complex structure. The creation of internal specialized consultancy capability provides individual conservation actions to be treated as projects where a cost-benefit analysis can be undertaken. The required resources feeding through to quantifiable outputs and benefits of a project can be tracked transparently, where the functional management process is clearly mapped. A caveat for such a "back-office" process and concentration on management technique is that it is often not well communicated or understood outside the organization, and can lead to negative perception about the business oriented culture of the organization. Such perception may be reinforced due to the lack of wider appreciation of the role of the process of management within the realm of cultural heritage management, and efforts must be made to promote the understanding of the business function of heritage internally and externally to a cultural heritage organization and how it positively contributes to that conservation effort.

It is worth noting that in an international business context, the management of cultural heritage resonates with current business preoccupations associated with social development and cultural capital development, issues of corporate social responsibility, and environmental sustainability. These large-scale themes are in many respects at the heart of good cultural heritage management, and therefore, the interplay of the business of cultural heritage is likely to be of growing interest in the coming years, beyond the focus to date on the basic enterprise of cultural heritage management, tending to focus on the enterprise of heritage tourism.

Cultural Heritage Management: Cost and Benefit of Change

Julie Hollowell
Department of Anthropology, Indiana University, Bloomington, IN, USA

Introduction

Cultural heritage management (CHM) has changed a great deal since it first became a recognized field of practice. Some changes have been restrictive and regulatory, while others have been democratic and emancipatory. In either case, change – and reflection on the causes and consequences of change – is critical for improving practice and generating better ways of engaging with the power relations and legacies of colonialism that still pervade many heritage management schemes. This entry looks at areas where significant change has taken place and some of the costs and benefits associated with those changes.

Key Issues/Current Debates/Future Directions/Examples

The Rise of CHM as a Profession

The rise of CHM as a distinct, vital field of archaeological practice in so many parts of the world is undoubtedly one of the most significant changes in archaeology over the last century. Nation-states have long been aware of the salience of connections between heritage sites and cultural identity. The initial mandate of the nascent field of cultural heritage management was managing, maintaining, and preserving sites of "significance" to the nation-state. During the second half of the nineteenth century, in many places, the role of a cultural heritage manager also came to focus on salvage and mitigation of damage to sites that were targeted for development or otherwise endangered, whether by roads, dams, airstrips, looting, or urbanization. As cultural heritage managers turned toward safeguarding sites from development and looting, they faced practical and ethical quandaries raised by considering the costs and benefits of preservation versus development.

A Conservation Ethic

In many places, the idea of a "conservation ethic" became a hallmark of CHM (Lipe 1974). Site preservation was the primary goal, with the destructive processes of excavation reserved for sites that are endangered. Benefits of such an approach have included recognition of the importance of in situ preservation and a more holistic, less object-centered perspective on sites and landscapes. On the other hand, conservation approaches offer less opportunity for hands-on training in excavation methods and techniques and generate less archaeological data.

Standardization

Another change accompanying the rise of CHM has been the passage of legislation and the promulgation of government regulations mandating specific standards and practices, at least for projects where government agencies or funds were involved. With this change, archaeology found itself entrenched within government agencies,

where it became codified and bureaucratized, subject to government oversight and decisions about what was significant or worth preserving. Once heritage management procedures became standardized, making a change of any kind was more difficult to accomplish. Much of this legislation did bring heritage management into the development planning process, albeit in a very limited way, and it also showed growing recognition of the importance of preserving culturally significant sites. As a result, a significant percentage of archaeological work shifted from being research driven to regulation driven. Changes in government-level funding have also greatly influenced priorities and how things get done.

The Business of CHM

The rise of heritage management as a business, often called "contract archaeology," has been one of the most far-reaching changes in the field of CHM. In many places, both private and public sector firms act as contractors and service providers for government-mandated heritage work. An obvious benefit is that today the majority of aspiring archaeologists find employment (and training) in contract archaeology or a related field. One of the resulting costs has been a split between research-oriented archaeology, based in the academy, and contract archaeology, based in government or the private sector. Until recently, the results of work done in the context of contract archaeology tended to remain in the gray literature, difficult to access and so without much influence on research and theory. This has gradually been changing, both because of increased recognition of contract archaeology's contributions to research and the increase in peer-reviewed journals and other publications that embrace topics in heritage management and applied archaeology.

Professionalization

Another important change, motivated in part by the steady growth of the field of CHM, relates to professionalization of the discipline. The establishment of professional archaeological organizations (such as the Register of Professional Archaeologists in the USA), the adoption of standards and codes of conduct and training, and the development of certification programs are all aspects of professionalization that help assure employers. Professionalization has created a cadre of practitioners with many shared principles, challenges, and experiences. On the other hand, professionalization comes at the cost of drawing boundaries that exclude those who don't have the proper credentials, whether amateur archaeologists or traditional culture bearers. Codes of conduct tend to reinforce these boundaries at the risk of becoming rigid unchanging rules rather than principles to aspire to or guidelines for more inclusive practice. While professionalization adds value to the role and position of practicing heritage managers, it can also distance them from the people they serve.

Increased specialization is yet another area of change within archaeology that has incurred both costs and benefits. Specialized knowledge brings added depth of knowledge and skills to a particular problem, but among the costs is the need for a larger, more interdisciplinary team to make sure that particular skill sets and knowledge areas are covered.

Anticommercialization

One outgrowth of professionalization has been a move to denounce the commercialization of objects and the excavation of sites for the purpose of locating objects to exploit their commercial value. In general, the field of CHM has championed the ethic of anticommercialization as a step toward preventing site destruction and preserving the value of sites and the stories they tell for a state and its many publics. No longer are excavations sponsored by wealthy patrons who have first pick of objects for their personal collections. No longer are antiquities dealers welcome to sell their wares to museum curators. Many museums today are skeptical of acquiring archaeological objects that were purchased on the market. While CHM has taken a clear stance against looting, many ethical contradictions still exist when it comes to entanglements with commercialization. Consider the growing involvement that cultural heritage managers have with for-profit tourism or the role they play in evaluating site

significance so that for-profit development or resource extraction can go ahead.

Archaeology for the Public

With the development of CHM as a distinct field has come a heightened sense of accountability among practitioners – a sense of responsibility that stretches beyond simply being a good scholar, scientist, or steward of the archaeological record. Archaeology was no longer just about dead people and what they left behind. Public outreach became an obligatory aspect of ethical archaeological practice. This spawned a branch of archaeology often known as "public archaeology," which is essentially synonymous with public sector CHM. This change brought a mandate to educate and involve the public, which meant having to negotiate among multiple values, agendas, and perspectives. There were many publics and stakeholders, each with different (and potentially conflicting) ways of valuing of the past (McManamon 1991).

These public outreach programs typically were established as part of state and federal programs, whose objectives are to educate the public about the value of site preservation. Heritage managers were initially trained to see themselves as having the authority to serve as stewards of a nation's heritage in the name of the public trust. Cultural heritage managers also reached out to groups and individuals with connections to sites and objects, sometimes in the course of gathering information about the history of a site for a report or exhibition. Many received training in ethnography or oral history as ways to obtain more holistic and informed understandings of sites and their meanings from multiple perspectives.

Greater democratization has been another important benefit of the focus on public archaeology. On the other hand, consultation and outreach are time-consuming and unpredictable. In some contexts, these changes have resulted in increased restrictions on access to information or objects once considered public. For example, some Aboriginal groups prohibit certain objects held by museums from public view or require permission for researchers to work with particular collections or cultural materials.

Curation

The field of CHM has also encountered changing attitudes about curation and collections management over the past generation. Once the lack of adequate storage for collections reached crisis proportions, this forced a reevaluation of curation standards and guidelines and encouraged new perspectives on accessions and deaccessions. This has meant making some hard choices about what to keep – choices that could even prove wrong in hindsight. It's now common practice to perceive curation as beginning in the field, with decisions about what to collect and what to discard. (In the United States, current regulations do not allow federally funded repositories to deaccession archaeological materials. This legislation needs changing, but the process is difficult and painfully slow.) One positive outcome of the curation crisis is that heritage managers, collections curators, and source communities are beginning to work together. Culturally sensitive and appropriate curation practices have added a new dimension of understanding to collections and the meanings of objects. The new relationships that are built in these contexts reflect the changing role of museums and archives, from colonialist institutions to places of access that serve as keeping places for the treasures of particular groups. The curation crisis has also caused people to reflect on the ethics of digging things up and keeping them – for whom? For what?

New Contexts for CHM

Other major changes for the field of CHM have come from the expanding roles that archaeology and heritage management now have in the contexts of urban renewal, community revitalization, or Indigenous rights. Cultural heritage management now plays a major role in community development and revitalization, a change that parallels increasing interest in historic preservation in both public and private sectors. Some of this has been in conjunction with the adaptive reuse of historic sites – lighthouses, warehouses, former government installations – by nonprofit or for-profit public and private enterprises. Nearly 50% of all building renovation or construction in European cities today is related to heritage preservation

(Cassar 2006: 1). As Cassar (2006) notes, the renovation of historic city centers offers benefits of numerous kinds – from better transportation and less pollution to social revitalization of communities and neighborhoods, increased wellness, conviviality, and a sense of common identity and aspiration. Costs include the consequences of revitalization for already marginalized groups, such as homeless individuals or low-income families, who tend to become displaced as a result of urban development.

Cultural heritage management also plays an important role in tribal and Aboriginal self-governance, where strong connections are recognized between heritage management and sovereignty (see Welch et al. 2006). Many groups have their own heritage management programs that deal with issues of land claims, resource rights, comanagement agreements with state agencies, research permissions, repatriation, youth education, development decisions, and a host of other things.

Working with Development Agencies

Those who work in cultural heritage management today may also find themselves working with projects led by multilateral development banks or transnational corporations (TNCs). Rio Tinto, the World Bank, UNESCO, and other transnational entities have come to recognize the importance of "culture" to the success of their plans and operations (see Bradshaw et al. 2011) and so have taken a strong interest in the "economics of culture" (see World Bank 2000; Throsby 2001), particularly how cultural factors affect their costs and benefits. Connections between the sustainability and appropriateness of development with cultural heritage have been demonstrated over and over and now are generally accepted. Development agencies are interested in identifying changes in value that result from a proposed project, and it turns out that many of these changes are tied to culture, not simply economics. Many development agencies and TNCs have turned to CHM to help them assess local values or develop strategies for interfacing with local communities that are at risk or otherwise affected by their projects, often as a way to mitigate negative social and cultural effects. In Canada, Australia, South America, and elsewhere, cultural heritage managers are being hired by mining interests and other for-profit resource development companies to map areas of traditional resource use, train development workers in community relations, and more. While collaborations with major development firms may help mitigate some forms of cultural and environmental harm, the costs can also be great and difficult to predict. Some of the conflicts that arise are in part because developers neglect to integrate heritage management into the early stages of the planning process. Often local communities end up having little or no share in substantive decisions or profits. The large power imbalances and the nature of what is at stake for substantial numbers of people necessitate that the costs and benefits of these kinds of collaborations be carefully considered and negotiated. Cultural heritage managers may find themselves in situations that demand a full review of ethical implications and potential consequences. In any case, working with development initiatives at all different scales (from local to transnational) is likely to be an increasingly important aspect of cultural heritage management in the years ahead.

Cost-Benefit Analysis

Cultural heritage managers today often use value-based approaches to evaluate the significance of sites and inform management decisions (see de la Torre 2002). Although some have advocated using a modified version of cost-benefit analysis to inform CHM decisions, there are many problems with such an approach. Many of the cultural costs of development are difficult to identify and even more difficult to quantify, and they often have unintended and unforeseen consequences. Moreover, these decisions typically involve someone else's heritage and may reflect values or potentials that are not obvious or straightforward, especially to cultural outsiders. Cost-benefit analysis has also been criticized as a discourse that tends to distance management decisions from actual people and their concerns and instead objectify and predict based on "the public good." The general conclusion is that cost-benefit analysis is not a useful tool at the scale that most CHM

decisions are made, since local governments or small businesses are usually the ones involved. Some are exploring ways to make CBA more culturally appropriate and relevant, given that it could present ideas and information in terms that developers and others understand.

War and Civil Unrest

The field of CHM has also been affected by the increased recognition of the role that cultural heritage sites and objects play during times of war and civil unrest. The costs are great in that the most meaningful cultural sites are those at greatest risk of becoming targets because of their high symbolic value (see the entry on "▶ Somaliland: Cultural Heritage Management" in this encyclopedia). In times of war and civil unrest, looting, site destruction, and smuggling escalate. People who have lost their livelihoods are tempted to turn to commercial exploitation of portable antiquities. The global antiquities market feeds on this instability. Military occupation of sites is another form of physical and symbolic violence.

It's likely that the cultural value of sites will continue to have great salience in times of struggle and in global identity politics. Many countries recognize cultural heritage as a potent aspect of international diplomacy and national identity. Global attention to these issues has also increased awareness of the significance and fragility of cultural sites.

Other Global Flows

The past generation has witnessed an explosion in the global circulation of people, ideas, and information surrounding tangible and intangible heritage. Today, archaeologists and heritage managers often find themselves working on shifting global terrains that involve international conventions, world heritage sites, the international circulation of cultural property, digital access to information, and cultural tourism development.

The globalization of CHM is evident in the rise of international charters, conventions, and programs covering a range of cultural heritage management concerns, from protection for underwater heritage resources, safeguarding intangible heritage, protecting the built environment, or the development of World Heritage Sites. Today, most countries have an administrative framework that gives heritage management a high profile, and many have passed legislation protecting heritage sites and cultural properties. International bodies such as UNESCO and ICOMOS have promulgated conventions and charters that address global and regional concerns. To be enforceable, these documents must be ratified and then developed into legislation by individual nation-states. In most instances, cultural heritage managers will be the ones to implement and oversee these agreements.

Global attention to heritage and its many values is gradually changing people's perceptions about the antiquities trade, damage to heritage sites, and in general has created a resurgence of national and local interest in safeguarding tangible and intangible heritage. Today, more and more countries, especially those "archaeologically rich" nations that have watched their cultural goods drain onto the antiquities market, are focusing cultural heritage management efforts on the protection and restitution of movable and immovable cultural property, seeking the return of objects that have left their borders under questionable circumstances, and protecting those that remain. While these policies can reinforce nationalistic ties to heritage objects, they also bring growing attention to the problematic nature of the antiquities market.

The move to digital records and collections has brought significant changes, especially for museums and source communities. Digital information sharing facilitates access to collections, wherever the technology exists. There are many benefits, but digital sharing of cultural information also brings new costs and considerations about ownership, copyright, appropriate use, and the sustainability of digital media. Cultural groups are becoming more and more concerned about uncontrolled sharing of cultural knowledge and the consequences of releasing certain kinds of information into the public domain. For some source nations or communities, the "digital return" of objects, images, and information constitutes a significant form of restitution.

Cultural heritage managers have an important role to play in how local and national histories are interpreted and whether these narratives and their production take a more exclusive or more democratized approach. In situations where nationalistic views of a homogenized past have become state doctrine, cultural revitalization can potentially work to exacerbate ethnic tensions or it can foster respect for multiple, alternative histories. One problem is that players in the field of international cultural heritage often seem out of touch with local realities. The world heritage sector has tended to focus on global or state-level needs and relationships, instead of benefits for local people.

Cultural Tourism

Another international realm where CHM has become increasingly important is cultural tourism, also called "heritage tourism." Cultural tourism is big business. Study after study indicates that tourists are looking for "authentic" cultural experiences. Archaeological sites, historic places, and cultural attractions all over the world are being developed for tourism by public and private investors. In most cases, the potential for economic benefits is the driving force. While cultural tourism can indeed generate local pride and profits, potential costs include an economic dependency on tourism and the unforeseen social changes wrought by mass infusions of people and money. Sometimes, profits go directly to the care and management of sites or to support local artisans, but in many situations, the benefits of turning cultural capital into economic capital are not so clear. As Amalia Perez-Juez notes (this volume), "It is becoming very clear that incorporating archaeological sites in a tourist itinerary can generate benefits for the region, but only sustainable management of these sites will lead to local development." In too many cases, tourist dollars are diverted to nonlocal channels, bypassing local beneficiaries. The danger is that heritage is being managed and manipulated not in the best interests of people living near or with cultural connections to sites, but as a form of international cultural capital, to draw tourists or enhance nationalist narratives. Cultural heritage managers are likely to play an integral role in tourism development and in identifying costs and benefits in terms of local values, authority, and potential for good or harm.

Collaborative and Community-Based Heritage Management

One very positive change in the field of CHM in recent decades has been the proliferation of truly collaborative approaches to heritage management. Today, cultural heritage managers often work at the interfaces between source communities, cultural institutions, and the public, developing partnerships and sharing management decisions, in spite of the significant costs in time and effort this can entail. Making sure that source communities are involved in decisions that affect them or their cultural resources is a significant part of the role of a cultural heritage manager today. In a growing number of situations, cultural heritage managers work with and for local communities on projects and initiatives designed to meet community needs. These transformative CHM practices render many benefits from richer understandings of culture and heritage to more meaningful and just relationships with those who have their own connections to pasts and places.

Community-based management challenges heritage managers in numerous ways. There are costs in terms of the time and patience it takes to build authentic, trusting relationships, especially for heritage managers who are ever more stretched by the expanding responsibilities that come with involvement in community development. Community-based approaches require a shift in control and authority that can be challenging for heritage managers who have been trained to act in the name of "the archaeological record," the state, or an elusive "public trust." In general, it has been shown that the costs of giving up control and listening to the voices of those who have the most at stake are well worth it. The relationships created in the process are opportunities to learn a great deal about sites and objects and their agency in the past and present.

Another less tangible, but equally significant, benefit is that democratized, community-based approaches offer some excellent examples of

good practice and innovation in heritage management that move toward decolonializing CHM. There are times when the democratization of CHM – the inclusion of the voices and opinions of those who have the most at stake – may result in decisions to limit access to specific sites or heritage performances for cultural reasons, or to restrict the circulation of certain information or images, or to require special permits from researchers seeking to work with particular objects or collections. Cultural heritage management has also been the subject of ethnographic critiques that explore topics such as relationships between people and sites, strategic deployment of cultural symbols for various ends, and the potential for heritage to divide people or to bring them together. These critiques help us reflect on the direction that the field of CHM might be heading or has been (see Edgeworth 2006; Hamilakis and Duke 2007).

Training

Finally, the field of CHM is faced with the challenge of developing training programs that keep up with the many changes its practitioners are experiencing. Are future heritage managers being adequately prepared to make decisions about the many contradictory and ethically challenging topics that they will face? Are those already in CHM positions receiving training that supports the new roles they will take on in their positions? UNESCO, for example, has been conducting regional training programs for cultural heritage managers, covering topics such as standards for maritime archaeology, how to ensure sustainable benefits for source communities, and how to build local and regional capacity. Such programs create a cohort of people who work in the same region and face similar challenges in translating global directives into beneficial and sustainable local initiatives. In this way, they provide heritage managers with much-needed networks and support.

Conclusion

As a practice and a profession, heritage management must remain open to change. Change has many costs. It is risky and time-consuming. It requires defining new roles and building new relationships. It can mean having to give up control, face painful memories, or withstand criticism. But the costs of not changing, and of not reflecting critically on where CHM has been and where it is heading, are far greater. Since Henry Cleere's seminal volume in 1984, many others have described and compared approaches to CHM from all over the world. This breadth and awareness transformed CHM from a nationalistic enterprise into a globally significant endeavor, operating at a range of scales, ever more involved with transnational forces but also ultimately concerned with how these integrate with local goals and aspirations. Willingness to reflect on the cost and benefits of change can only lead to better understandings about what constitutes good practice and will continue to enrich the ever-changing field of CHM.

Cultural Heritage Management: International Practice and Regional Applications

Ken Taylor
Centre for Heritage and Museum Studies, Research School of Humanities and the Arts, The Australian National University, Canberra, ACT, Australia

Introduction: Shifting Ground

In approaching this chapter to the second edition of the encyclopedia through an update of the original first edition chapter, it seemed inappropriate to undertake nothing other than minor revisions and edits. Rather, the original is used as a stepping stone for a reflection on changes that have taken place incrementally in the heritagization process since the mid to late 1980s. There are two reasons for this decision. The first is encompassed in the pithy comment by Lowenthal (1996:xi):

> All at once heritage is everywhere … One can hardly move without bumping into a heritage site. Every legacy is cherished.

The second is tied to one of the key issues discussed in the first edition "Protecting Whose Values?" (page 1942) under the premise that:

> Laying down global frameworks for protecting cultural heritage underpinned by methodical approaches to identification and assessment of heritage resources, analysis of significance, and evaluation of proposals has led to an internationally accepted *modus operandi*. It represents a modern bureaucratic system where heritage resources are itemized through categories and entered in registers and lists. While we need to apply such tools anchored in a systematic and demonstrable way of working, they, and associated charters, have in the past shown their Western cultural origins (Byrne 1991) and, one may add, Western values. Although what is needed now is consideration of how these may well be values shared by other cultures. Nevertheless the underlying concern is how far do such universal approaches based on Western methodologies and thinking adequately address regional cultural values and differences across the world?

Since Byrne made his observation, changes have taken place in international debate on concern for regional values coincidental with the promulgation of new charters and declarations as I discuss in the following section and with reference to Table 1. Nevertheless there continues to be debate on whether international practice is dominated by Western ideologies and particularly those from Europe/North America associated with the cultural phenomenon referred to as "Eurocentrism." Eurocentric exceptionalism posits the idea of Eurocentric cultural values as superior to non-European societies and advocates adoption of Western values – individuality, human rights, equality, democracy, free markets, secularism, and social justice – as a universalist phenomenon no matter how different various societies are socially, culturally, and historically (Pokhrel 2011:321). Related to these culture clashes has been growing questioning particularly, for example, in Asia, of Western/European approaches to cultural heritage conservation, i.e., superimposing, as superior, a Western context on different cultural contexts. Winter (2014:123) refers to this as a "discourse of difference [that] has emerged where Asia is claimed to be materially, culturally and historically different to the west; most pointedly Europe, the global birthplace of the modern conservation movement." Winter aptly applies the term "politics of difference" to what in effect could be in danger of becoming an insurmountable east/west divide. I contend that it should not be seen as a divide but something to be bridged with cross-cultural understanding of different cultural contexts under the umbrella of cultural relativism.

At this point I suggest also that the concept of heritage conservation in Asia supposedly dominated and steered by "Eurocentrism" – Winter's politics of difference – is being overplayed, often for nationalistic political reasons. It is advisable, therefore, to take a reflective, rather than an essentialist, approach to the concept of "Eurocentrism" (Taylor and Xu (2018)). An essentialist approach assumes that nothing has changed in Europe from a material fabric-oriented approach to famous monuments and sites. This may have been the case in the 1970s and stretching into the 1980s, but the 1990s were when the winds of change started to be felt, such that since then the "conservation discourse of material culture has moved on in Europe" (Winter 2014:134). One may also speculate that the idea of the imposition of "Eurocentrism" is readily used in Asia to legitimize, while obfuscating, the drive to be on the global World Heritage stage with its political and nationalistic prestige and prestige of attracting tourists whose spending boosts government coffers.

The World Heritage Convention has been variously criticized as being hegemonic and culturally inappropriate by forcing Western notions on countries with different value systems. As a result, questions are raised by many scholars on the extent to which nominations to the World Heritage list can or may distort local and regional values as nation states seize on political and economic considerations as drivers of nominations to the List. Such criticisms can be simplistic and problematic as they may – and do misguidedly in my view – eschew the role of agencies such as UNESCO and ICOMOS as imposing their standards and ideas on cultures outside the Western (read European) world. They ignore the fact that instruments such as the World Heritage Convention are routinely used by national governments around the world, not least in Asia, to further nationalistic agendas. In a trenchant critique Askew (2010:21/22) argues that:

Cultural Heritage Management: International Practice and Regional Applications, Table 1 Chronology of steps and actions in development of the heritage process

• **1945** the **United Nations** was formed
• Creation of the **United Nations Educational, Scientific and Cultural Organization [UNESCO]**, November 1945. The Constitution of UNESCO [November **1946**] mandates the Organization to ensure the conservation and protection of the world's inheritance of books, works of art, and monuments of history and science (UNESCO 2007). Here was established the firming of globalized thinking on cultural heritage protection in the modernist tradition of "ideas and practices that could be applied around the world regardless of differences in local cultures" (Logan 2001)
In the early UNESCO years, various missions were organized to advise member states on the conservation of heritage sites. Later these developed into international campaigns, of which the first was launched in **1959** on the temples of Abu Simbel, Egypt, threatened by the construction of the Aswan Dam
UNESCO also collaborated in the organization of meetings of experts in the preservation of heritage resources. These included a conference on the preservation of monuments held in Venice in **1964**, which adopted the ICOMOS ***International Charter for the Conservation and Restoration of Monuments and Sites*, (the *Venice Charter*)**
• In **1972** at a UN conference on the human environment in Stockholm, it was recommended that a UNESCO convention on World Heritage should be adopted, resulting in ***the Convention Concerning the Protection of the World Cultural and Natural Heritage*** (16 November 1972). Generally known as **the World Heritage Convention**, it has achieved a great deal during its existence. "Today, it is among the foremost international tools of conservation, and certainly among the best known" (Bandarin 2007:18)
• UNESCO was instrumental in setting up key international organizations – **ICOMOS, ICCROM**, and **IUCN** – that have become official advisory bodies to the World Heritage Centre
ICOMOS *(International Council on Monuments and Sites), a non-governmental organization with headquarters in Paris, was established in 1965. It is dedicated to the conservation of the world's historic monuments and sites and provides a forum for professional dialogue and a vehicle for the collection, evaluation, and dissemination of information on conservation principles, techniques, and policies. It also advises UNESCO on World Heritage cultural matters*
ICCROM *(International Centre for the Study of the Preservation and Restoration of Cultural Property) based in Rome was established in 1956 by UNESCO. It has a worldwide mandate to promote the conservation of all types of cultural heritage, movable and immovable, with the aim of improving the quality of conservation practices and raising awareness about the importance of preserving cultural heritage through training, cooperation, research, information, and awareness*
• **1979/1999/2013** ***Australia ICOMOS Charter for Conservation of Places of Cultural Significance* (*the Burra Charter*)**
• **1987** ***ICOMOS Charter for the Conservation of Historic Towns (Washington Charter)***
• **1992** the **World Heritage Centre** was established and is the focal point and coordinator within UNESCO for all matters related to World Heritage including managing of the Convention, organizing annual World Heritage Committee meetings, providing advice to States Parties in the preparation of nominations, and coordinating the reporting on the condition of sites and the emergency action undertaken when a site is threatened. The Centre also organizes technical seminars and workshops, updates the World Heritage list and database, develops teaching materials to raise awareness among young people of the need for heritage preservation, and keeps the public informed of World Heritage issues
• **1992 UNESCO Experts Meeting La Petite Pierre proposes categories for World Heritage recognition and revisions to WH Operational Guidelines**
• **1992 UNESCO World Heritage Centre recommends three categories of cultural landscapes for World Heritage recognition by WH Committee**
• **1993 Cultural Landscape Colloquium Montreal**
1993 UNESCO Experts Meeting, Templin, Germany
• **1994 ICOMOS,** ***the Nara Document on Authenticity***
• **1994** the World Heritage Committee (WHC) launched the ***Global Strategy for a Representative, Balanced and Credible World Heritage List*** (http://whc.unesco.org/en/globalstrategy), with the aim ensuring that the List reflects the world's cultural and natural diversity of outstanding universal value. The WHC wanted to broaden the definition of World Heritage to reflect better the full spectrum of the world's cultural and natural treasures and to provide a comprehensive framework and operational methodology for implementing the World Heritage Convention. It resulted from a global study carried out by ICOMOS from 1987 to 1993 which revealed that Europe, historic towns and religious monuments, Christianity, historical periods, and "elitist" architecture (in relation to vernacular) were all overrepresented on the World Heritage List, whereas, all living cultures, and especially "traditional cultures," were underrepresented

> The Eurocentric and crypto-imperialist [claim] is both redundant and a conceptual red herring: it misrecognises the real locus of power and exploitation in the global heritage game, which is the nation-state and not any dominant global institutional structure or discourse of heritage classification.

That differences and diversity between cultural contexts of east and west exist is clear. That approaches to cultural conservation can be different is also clear, not least in the Asian approach to partial replacement of fabric or total replacement through demolition and rebuilding. "Asian conservation is not so much about protecting the way a building or structure *looks* but what a building *does*" (Staiff 2016:33). In this regard Taylor and Altenburg (2006:271) note that in Asia:

> Replacement of fabric is acceptable because the significance of the place resides primarily in its continued spiritual meaning and symbolic value related to everyday use rather than pre-eminence of the fabric itself, the latter being held as a Western preoccupation.

Heritagization Process: Shifting Discourse?

A central question, therefore, is have we progressed, and if so to what extent, from when Byrne (1991) reflected that methods of working, tools, and in particular associated charters did show their Western cultural origins and in particular European values as has repeatedly been claimed? My answer to this question is that undoubtedly progress has been made and has been seen to be made not only through scholarly

and academic discourse but through changes in thinking in the global conservation profession and global agencies. This chapter, therefore, is a review of incremental changes in heritagization theory and practice – that have taken place over the past three decades as I explain below – and how they have addressed the question of universal values vis-à-vis regional values. How far have we progressed in broadening our thinking by moving away from a narrow focus explicit in Smith's (2006) Authorised Heritage Discourse (AHD) paradigm? To what extent have we transcended what I previously alluded to as "the concept of cultural imperialism – imposition of a foreign viewpoint or culture over another country – that emerged in the 1960s?" (page 1942). In this connection Winter (2014:125) addresses shifts in approaches to heritage conservation and the politics of difference, noting that "from within academia and the heritage conservation profession the calls for approaches more sensitive and responsive to the cultural context of the site or country in question have become increasingly loud."

My view is that progressive changes have occurred and notable ones at that. Table 1 outlines my take on notable milestones in the chronology of, and actions in, development of the heritage process, including various charters and declarations, in the late modern/postmodern period since World War II, but particularly from c1990 onward. Contrary to the skepticism of some scholars that the international bureaucracies and agencies, in particular UNESCO and ICOMOS, are immune to changes in thinking and broadening of cultural heritage theory and practice is the counterargument that it is a view not supported by evidence of shifts that have occurred (Table 1) in the 45 years since 1972 (see also Taylor 2017). Criticisms of the agencies revolve, inter alia, around what is seen as "a one size fits all" globalizing approach that stifles regional cultural differences. Contrary to such a view is that changes that have occurred are indicative of "UNESCO's progressive accommodation of heritage diversity" (Askew 2010:28) and demands to expand its thinking and practice. Askew (2010:19/20) further cogently argues that UNESCO has expanded its programs to mitigate the destructive effects of capitalism's globalization of cultural industries and that its key texts can be seen as beneficent globalization by its advocacy for worldwide protection of cultures and their valued tangible and intangible past. Harrison similarly reflects how there has been a shift "to accommodate an increasingly large number of objects, places, and perhaps most importantly, practices, and the landscapes in which these occur" (Harrison 2013:115). Coincidental has been the broadening of concern with culture and the intangible rather than focusing primarily on things. In the shift away from a concentration on monuments and sites, heritage now embraces:

> Precincts, historic urban centres, whole towns and villages, cultural landscapes, and historic urban landscapes, associative values and intangible heritage – the talents embodied in people, such as artistic skills in dance, music and painting, or skills in language, or craft and construction skills. (Logan 2010:38)

A key concept in changes has been the movement to acknowledge intangible heritage and related associative values, i.e., the values people associate with their heritage and how values change between cultures. Linked to this movement has been increasing attention being paid to cultural diversity and differing communities with diverse habits and modes of thinking and acting. Nevertheless, and notwithstanding heritage discourse with its interest expanding to acknowledge values-based approaches with the move away from a major focus on famous monuments and sites (the great White House syndrome (Australian colloquialism that neatly encapsulates the meaning.)), there still remains disquiet. In particular is the counterview of heritage (counterheritage) that sees mainstream heritage discourse as essentially hegemonic rather than democratic; that it relies on expert assessment and advice; that it constructs heritage items out of old things; and in particular reference to Asia that local people need to be educated by practitioners and governments (Byrne 2014). These transgressions certainly occur in Asia, but are often the outcome of top-down approaches by governments and agencies that not only distrust community participation, but avoid it. There are

exceptions as in the recent study and work in China at Shuang Wan Village (Verdini et al. 2017).

The context to the Shuang Wan study is the causes and effects of hitherto rapid and dislocating urbanization in China leading to loss of rural cultural roots. However, winds of change are blowing in terms of attention being given to rural cultural traditions as something quintessentially Chinese. It is part of a Chinese cultural revival movement (see, e.g., Billiou 2007) and extended cultural heritage thinking. These sit alongside an understanding of the potential role of "sustainable transformation of traditional villages" (Verdini et al. 2017:321). Notably, these changes are coincidental with China's participation in global heritage practice and its rise to second place on the UNESCO list of World Heritage properties behind Italy. On the outskirts of Suzhou, Shuang Wan village retains a distinctive rural character and is located in an area including the World Heritage listed water town of Tongli where tourism is thriving and increasing. A 2015 research project tested the UNESCO Historic Urban Landscape (HUL) approach to strike a balance between urban development and rural landscape conservation (Verdini et al. 2017). The study was undertaken in cooperation with a village committee and participatory workshops to get consensus on a shared vision for future development and income-generating activities. The result has been "discussions on how to rebrand the entire village" (UNESCO 2016) and maintain such activities as home-based textile enterprises through online selling alongside improvements to the physical setting.

Role of Landscape: Politics of Similarity

Further to Byrne's (2014) counterheritage discourse is his setting out for the Asian context the significance of popular religions with their numinous or spiritual quality where people call on spirits for help in daily life, their belief in ancestor worship, myths, legends, and folklore and the relationship of such intangibles to the concept of sacred landscapes. Such numinous character is seen in sacred sites or places commonly throughout the landscapes in Asia where they are viewed as spiritscapes, as, for example, in the Lua people of Northern Thailand whose relationship with various sacred mountain sites along the Thongchai range is grounded in their animistic and Buddhist beliefs (Pongpandecha and Taylor 2016). "It is becoming increasingly clear that the sacred dimension can and does play an important role in landscape care and nature conservation" (Studley 2010:107). The spiritual qualities are indicative, in effect, of what has nicely been called the "ordinarily sacred" (Sexson 1992). Numinous beliefs also accord with the notion that heritage is concerned with the here and now, not just the past as in the 1970s' monuments and sites syndrome. It is a view that has gained traction globally since the 1990s and is now universal. A simple but telling example occurred at Bagan in Myanmar (now in the process of being nominated for World Heritage listing). In addition to major religious monuments and stupas, Bagan in its heyday had many small stupas representing events such as birth, enlightenment, and miracles. Most of these disappeared over time. With the advent of interest in Bagan from the 1980s, many of these small stupas have been rebuilt without reference to research or archaeological evidence. The practice in the 1980s and 1990s came in for criticism by Western archaeologists, ignoring the significance of the Buddhist spiritual context of making merit and its meaning. The rebuilt physical aspect of the stupas was/is immaterial to Buddhist practice and life meaning and the practice of merit making. It was also argued by detractors that rebuilding by people giving donations was a way of making money.

Notably, the notion of the ordinarily sacred is recognized in everyday places in Western society as set out by Lynda Sexson (1992) in her book *Ordinarily Sacred*. Indeed since the promulgation of the World Heritage cultural landscape categories (1992), there has been an increase in nominations to the World Heritage list of landscapes that represent everyday lived-in landscapes operated by ordinary people in both western and eastern settings: for example, Bali Rice Terraces, the Philippines' Rice Terraces, Cornwall and West Devon Mining Landscape (UK), and Blaenavon Mining

Landscape (UK). It is important, therefore, in the field of heritage conservation that, for such vernacular landscapes, we understand the spiritual relationships between people and their landscapes as in Byrne's numinous, spiritual quality. Such a link is seen in the European Landscape Convention (Roe and Taylor, 2014:8):

> In particular, the ordinary landscapes where most people live are seen as having potential value to someone, even though the quality may be low in terms of many of the commonly identified indicators, such as scenic beauty, biodiversity rating, range of use and accessibility. The emphasis here is very much on the value to 'someone' (communities, cultures and individuals).

What this perspective suggests is that there are distinct similarities in human associative relationships with, and sense of, place. Specifics may differ in terms of nuances of aspects such as the spiritual associated with the ordinarily sacred, but what this suggests to me is that there is a need to bridge the politics of difference and think in broader term of politics of similarity. In the broadening of thinking that has occurred, a movement to cross-cultural and societal boundaries and understanding regional differences in values is discernible. It is a movement which has gathered pace since the 1992 World Heritage cultural landscape categories and ICOMOS (1964) *Nara Document on Authenticity.* In this regard Bi et al. (2016:192) note:

> The international heritage arena has witnessed a trend of moving from a single discourse – the "authorized heritage discourse" (Smith 2006) – to multiple discourses . . . However, the dominance of the "authorized heritage discourse" does not imply that it has not been unchallenged or responded. The value, culture, and community input of heritage conservation has been acknowledged and has gradually gained momentum since the 1980s, through interest in such things as cultural diversity, *cultural landscape* (my italics) and community development both in academia and within international bodies like UNESCO and ICOMOS.

Setting

In the context of this chapter – and linking to the previous version – a keyword in the shifting heritagization discourse is "setting." Setting is used in the notion of situating mentally and locating physically a heritage place or site. It is the area of land with which a heritage site interacts as expressed, for example, in the ICOMOS (2005a) *Xi'an Declaration on the Conservation of the Setting of Heritage Structures, Sites and Areas* and in the reference to setting in ICOMOS (1994) *Nara Document on Authenticity.* In this sense "setting" encompasses intangible associative aspects of heritage and has close connection with the construct of (cultural) landscape. This was expressed in the earlier chapter version (p. 1947) as "A synonym for setting is landscape and presumably embraces the notion of cultural landscape reflecting how and why people have shaped their surrounds according to their ideologies." It corresponds with the *Burra Charter* (Australia ICOMOS 2013 Article 8) reference to conservation requiring retention of an appropriate *setting*. This includes retention of the visual and sensory setting, as well as the retention of spiritual and other cultural relationships that contribute to the *cultural significance* of the *place*.

The terms "landscape" and "setting" are closely linked; for example, we often refer to "the landscape setting" of a heritage site (see also below reference to Sullivan 1985). Notably in *Principles for the Conservation of Heritage Sites in China* (China ICOMOS 2000), the term "landscape" is quoted as a synonym for "setting." There are connections here with the notion of landscape as "bounded area" (Wylie 2007:21). Wylie discusses how the term "landscape" and its meanings infer connections with various words emanating from German and Dutch etymological roots. The bounded area definition stems from the German *landschäft* (to which the term *Kulturlandschaft*, from which "cultural landscape comes," is linked), while "the Dutch equivalent, *landchap,* has a much more strongly visual and artistic connotation, it is much closer to the idea of land as perceived, or a picture of land, whereas the Germanic ties much more closely to the land itself, to the notion of objective external space" (Wylie 2007:21). Nevertheless the cultural landscape construct transcends that of objective external space. It has its origin in the development of the Germanic geographical tradition and notion of

kulturlandschaft, a word first used by the German geographer, Otto Schlüter who "came to champion the view that the essential object of geographical inquiry was landscape morphology as a cultural product" (Livingstone 1992:264). Schlüter's work was followed by that of Franz Boas, anthropologist and geographer, with his tenet that it is critical to landscape study to understand cultural traits of societies – behaviors, beliefs, and symbols – and the necessity to examine them in their local context. Boas' precepts are philosophically critical to modern understanding of "landscapes as a clue to culture" (Lewis 1979:15) and how appreciation of this has played a significant part in broadening of thinking and practice in the heritagization process.

It should be noted that the term "cultural landscape" did present challenges in an Asian context (particularly Southeast and East Asia) in the 1990s and into the later 2000s. It was viewed as a Western notion, and the fact that Asian languages have no direct equivalent to the term was problematic. For example, from a Chinese perspective, the term was seen as a tautology in that all landscape is cultural: landscape without people is oxymoronic. As discussed in a 2009 paper (Taylor 2009), it could be seen that Asian terms equivalent to landscape intrinsically involved interaction between people and landscape – travelling through, being in, looking at, and imagining being in the landscape – and interpreted concepts of nature differently to those of a Western binary between culture and nature. What the contested discourse misread was that the 1992 World Heritage categories were in fact an attempt to bridge global cultural diversity and values with the notion that cultural landscapes were at:

> The interface between nature and culture, tangible and intangible heritage, biological and cultural heritage. Rössler (2006:334)

Nevertheless the term "cultural landscape" has become increasingly accepted (For example, SACH (State Administration of Cultural Heritage, the national agency responsible for management of cultural heritage management sites and policy and museums in China) indicated that the subject of cultural landscapes was to be addressed when the Director of SACH at a May 2008 ICOMOS Asia Pacific Conference referring to the international significance of cultural landscapes declared they will be a focus of attention for China over the next few years. He also mandated the use of the term "cultural landscape."), not least with the inscription of various Southeast and East Asian cultural landscapes on the World Heritage list. By the beginning of 2017, there were 17 such landscapes in Southeast and East Asia included on the World Heritage list as cultural landscapes out of a global total of 88 (UNESCO website http://whc.unesco.org/en/culturallandscape/). Prior to 2004 there were four.

Pivotal to the rise of the cultural landscape construct has been the concept of landscape as process. Parallel has been critical inquiry into the concept of heritage as process (Harvey 2001; Howard 2003), and in my view the coincidence is not accidental. The two are intellectually linked. Covering far more than simply buildings, structures, and sites, such processes embrace concepts of living history and living heritage to encompass the full spectrum of people's sense of place, traditional knowledge and its transmission, cultural production including equity and access, creativity and innovation, and the safeguarding of natural resources and cultural traditions that provide the foundations of local livelihoods. Further, the concept of living heritage as a resource for local community-based sustainable development offers a foundation for an association of cultural sustainability with heritage management action.

Living History and Living Heritage

In addition to recognizing the profundity of the concepts of living history and living heritage as a prime resource for local community-based sustainable development, they have become a lens through which cultural heritage management is increasingly perceived. The significance of these concepts is grounded in the 1980s/1990s academic and serious professional debates in public history and folklore studies as seen, for example, in the emergence of two journals: *The Public Historian*, in the USA in 1978 (National Council

on Public History), and the Australian journal *Public History Review* (University of Technology Sydney, editor Paul Ashton) with its first edition in August 1992. In the first edition of *Public History Review*, the idea of landscapes as public historical resource was explored (Taylor and Winston-Gregson 1992:81):

> The term cultural landscape is now commonly used by a range of professionals involved in historical research, heritage conservation and heritage interpretation. Interest in cultural landscapes follows from a growth in understanding of the role of landscape as a statement of the history of people . . .
>
> It is part of an increasing awareness of the historic significance and social significance, with resultant heritage values, of cultural landscapes. Sharon Sullivan commented in 1985 on the growth of the popular heritage movement leading to history becoming more accessible to the public because "People are asking themselves What happened in our history" [see Sullivan 1985:15]. As part of presenting answers Sullivan points to the importance of cultural landscapes as the total setting for public history. She suggests that these landscapes are part of our "intellectual and cultural background of which they are a product."

Scholarly commentary on the link being forged between public history and popular interest in heritage was apparent in the work of the Marxist historian Raphael Samuel. In his *Theatres of Memory* (1994), Samuel explores "the *social* role of heritage" (Harrison 2010:241) and its expanding horizons from the rich and famous and the elite country house and park image of history and heritage to ideas of people's history or "history from below" (West and McKellar 2010:196; see also Harrison 2010:241). The tension here is where does history from "below the stairs' imagery – cosily reassuring film and television images of servants in their quarters and their relationships with masters and mistresses – change to real history from below?" Harrison (2013:100) suggests that Samuel saw the answer to this in regarding heritage as a social process that had "served to make the past more democratic through an emphasis on 'ordinary' people." It is reflected in my view in cultural landscape nominations for World Heritage recognition. Popular interest in genealogy may be seen as another reflection of the democratizing of heritage.

Changing ideas on living history and living heritage and history/heritage from below are also reflected in various international heritage initiatives – milestones – such as ICCROM 2000 *Promoting People Centre Approaches to Conservation: Living Heritage* (http://www.iccrom.org/priority-areas/living-heritage/); *Filling the Gaps* (ICOMOS 2005b); *World Heritage Challenges for the Millennium* (UNESCO 2007); "Community" added in 2007 (World Heritage Committee, Decision 31 COM 13B) as fourth "C" to Credibility, Capacity Building, Communication in the 2002 *Budapest Declaration on World Heritage*; UNESCO *World Heritage Papers 26* 2009 on Cultural Landscapes (Mitchell et al. 2009); *UNESCO World Heritage Papers 31 2012 on Community Development and World Heritage* (Albert et al. 2012); and *UNESCO World Heritage Papers 40 2014 on Engaging Communities in Stewardship of World Heritage* (Brown and Hey-Edie 2014). These initiatives are part of the notable milestones shown in Table 1.

The shift that has occurred in thinking on living history/living heritage is part of the reorientation of the "conventional" (Wijesuriya et al. 2013) cultural heritage management approach – once lionized by focus on care of the physical fabric of heritage structures – toward recognizing the significance of intangible cultural heritage and associated values of living communities and the needs and wishes of living communities who are the custodians of this heritage. Putting living history/living heritage center stage, the thinking goes and ensures a more engaged, better informed, and locally rooted conservation management process, which is more culturally sustainable. It also represents a move away from thinking of heritage as places and objects from the past and recognizing their continuing contemporary community role in society and social practices. Poulios (2014:28) expresses this in his three key principles that determine a "living heritage approach":

1. Recognizing local communities as the true long-term custodians of their heritage sites
2. Empowering communities in the conservation and management process and benefiting from

their traditional knowledge, management systems, and maintenance practices
3. Linking conservation to the sustainable development of the communities, by developing a process to manage change and by making heritage relevant to the needs of the contemporary communities

In regard to local community values and practice, the stated position of UNESCO should be noted as Logan (2012:115) reflects:

> UNESCO now argues that it is imperative that the values and practices of the local communities, together with traditional management systems, are fully understood, respected, encouraged and accommodated in management plans if the heritage resources are to be sustained into the future (UNESCO World Heritage Centre, 2004:9). This is a major advance towards establishing a human rights-based approach to World Heritage site management and would seem to give hope to further progress in this direction

At this point in the discussion, I reiterate that the two emergent ideas – cultural landscapes as process and heritage as process – are coincidental and mutually dependent. This link does not infer haphazard coincidence; rather that both movements and thought processes are closely interwoven and mutually dependent. They crystallized from growing concern for what exactly is heritage and scholarly critique of heritage practice globally from the mid-1980s onward with a perceived focus on famous monuments and sites. In addressing this topic, Harrison (2013:115) reflects that the post-1980s period has seen:

> . . . increasingly heritage shift away from a concern with 'things' to a concern with cultures, traditions and the 'intangible' . . . While this broadening agenda has been driven partially by economic interests and the need to appeal to increasingly diverse audiences, this has paralleled a movement in academic heritage studies away from a concern with materiality of heritage to a concern with heritage as a discourse and a system of values.

Materiality

While the movement toward concern for value systems has occurred, informed concern for materiality of heritage has not disappeared. Rather it has shifted away from a narrow focus on famous monuments and sites to inquiry into understanding better the role of fabric in meaning of heritage places without demeaning the role of physical preservation techniques. The two concerns run in parallel and indeed overlap and inform each other. They demand to be considered in tandem in approaches to understanding international practice and regional values. In contemplating this point, Winter (2014:134) observes that in relation to changes in pluralization of heritage and creation of different languages, diversification, and expansion of definition of heritage:

> . . . there is a much more developed understanding of the connections between the role of the fabric of heritage and the cultural economies of contemporary life. Endless examples could be cited that illustrate how the conservation of material fabric is understood as the starting point for the broader goal of maintaining sociocultural continuities, the very real, albeit analytically elusive, social glue that binds past and present. In other words, in many instances material authenticity operates as a guiding principal rather than an absolutist perspective ...

Is a focus on the real, "the 'really real'" (Harrison 2013:88) at odds with the focus on intangibility? I think not. It is my contention that some places/objects because of strong political and historical connotations can and do have inherent/intrinsic qualities (values?) that make people recognize them as heritage without any instruction from experts or learned arguments on whether values are universal. For example, tourists visiting Angkor know the archaeological remains are significant universally and inherently recognize them as such. They may have read in a tourist guide or coffee-table magazine that this is the case without giving it much thought. Here Berliner's (n.d.:2) commentary is instructive:

> what about the object, the site and the ritual per se? Are there any inherent, intrinsic qualities to sites, objects or gestures that make them catchy enough to become patrimoine? Something about their size, surfaces, colours, texture, localisation, rhythm, sound, taste; something sensual that makes them more likely to be noticed by a human observer, to trigger specific emotional reactions and to produce long-lasting memories about them? In other words, do buildings, practices and objects hold inner iconic properties and how may these (or not) influence the heritagization process?

Conclusion

This chapter has attempted to track what are tantamount to major structural shifts in heritage thinking and practice over the last few decades. The shifts relate particularly to the gradual opening post-1972 of a remarkable broadening critical debate and understanding of the concept of cultural heritage to that which had prevailed earlier in the 1960s and 1970s. I have attempted in Table 1 to summarize critical milestones in this broadening approach. It was a movement that emerged internationally in the late 1980s/early 1990s, and, as it gathered pace, it paved the way for deeper and more critical thinking and approaches to cultural heritage, including questioning of what is heritage, what is culture, and what are the social and political contexts of the globalization of heritage. Suffusing all these aspects has been an increasing perception of the significance of people and communities under the banner of what can be expressed as "heritage is about people."

It can also be seen how the leitmotif of heritage has been the focus of contestation between different groups, each claiming the high ground on what heritage is and, often more to the point, what in their opinion it is not. Contrary to academic and scholarly critiques of international agencies such as UNESCO and ICOMOS in the globalization of heritage, I have pointed to actions and initiatives where such organisations have advocated for, and set in train, measures to protect culture and heritage globally. They have done this through protocols, charters, declarations of universal principles, and compilation of inventories, the prime aim of which is to protect the world's tangible and intangible heritage. Parallel with this movement has been the growing understanding of the importance of applying universal methods of action through the lens of whose values are at stake. Nevertheless we have seen how the best of international intentions can be upset by the actions of individual players such as nation states.

A significant aspect of the heritage debate has been and remains a sometimes uneasy truce between different opinions in a dialogue on the tangible and intangible: things as opposed to culture. Such a dialogue should not encourage a view that disconnects conservation of material heritage from intangible aspects of heritage. On this point Skounti (2010:77) makes the point, with which I entirely agree:

> . . .there is no *one* intangible cultural heritage, there is a wide spectrum, ranging from the non- material dimension of a material heritage element (site, monument, object) to the most intangible aspect (tale, poem, song, musical note, prayer scent, perfume etc). Furthermore, pure immateriality is a fiction . . . There is obviously a material dimension to every element of intangible heritage.

My concluding observation is that heritage is about people, their places and objects, and how they see and value the physicality of things deemed to be heritage. In this sense managing cultural heritage is about exchange of ideas or opinions between people and those involved in cultural heritage management. It is vital that in the move to embrace affective aspects of heritage, we do not lose sight of the need to care for the quintessential material properties and qualities of "things." Above all there is a need to reinforce the idea that tangible and intangible heritage as demonstrated by the cultural landscape concept are not in opposition.

Introduction

Cultural heritage management (CHM) projects differ significantly from traditional academic research on cultural heritage (CH) subjects. They require a management strategy that focuses on client-consultant expectations and schedules, stakeholder concerns, and adherence to laws and regulations, in addition to completing project research objectives.

Definition

The primary difference between studying cultural heritage through an academic as opposed to a CHM project is that academic research is driven by the initiator's own topical and geographic research interests, whereas a CHM project is conducted in response to a proposed development project that triggers the project sponsor to comply with laws and regulations protecting CH resources. In addition, the former is generally funded through grants, endowments, or other funds dedicated to the advancement of research and administered through a university. The host institution is responsible for managing research endeavors and generally has a well-established administrative infrastructure that supports research throughout the institution. CHM projects are funded through a polluter-pays model, in which the developer (whether they are a private company or a government agency) is responsible for mitigating the harm caused to CH resources by their project. Because the developer is paying, CHM is driven by their specific needs. Project management is less about realizing the best research outcome than it is about producing needed CHM information to meet legal requirements in the most efficient manner possible. As a consequence, CHM projects require a very different management structure.

Historical Background

Whereas nearly all countries recognize the importance of CH, the development of CHM in any particular country is closely related to its historical, political, legal, social, and cultural context. Countries with strong legal requirements for the protection of heritage at various government levels (national, provincial, state, county, etc.) are generally the ones where a more mature CH industry has emerged over time. More detail on CHM around the world can be found in country-specific entries in this encyclopedia.

Key Issues/Current Debates

To manage a CHM project successfully, the CH consultant must understand the sponsor's (client's) objectives. These objectives are generally outlined in a document termed a scope of work (SOW), performance work statement (PWS), or terms of reference (TOR). This initial document describes the technical tasks to be completed, a schedule to be met, and a host of other requirements that the consultant must meet (e.g., qualifications and experience of CH professionals proposed to conduct the work, insurance requirements, health-and-safety plans, and often complex logistical protocols). In an open-competition scenario, consultants are asked to respond to a request for proposals (RFP), which commonly presents specific instructions on how the proposals are to be prepared and how they will be evaluated. In some countries, providers of CHM services are limited to government agencies. In these cases, the agency works closely with the project sponsor to scope the CHM project to meet compliance needs. Once agreed to by both the agency and the sponsor, the bid focuses primarily on the price and schedule.

Although legal requirements vary considerably by country, and laws and regulations are often supplemented by international conventions (Willems and Van Den Dries 2007), there are three basic types of CHM services. As a first step, the sponsor must identify CH resources that could be impacted by their project. Often termed an inventory, this step can in turn be subdivided between physical, tangible resources, such as archaeological sites and historic buildings, and intangible resources, such as songs, poems, and language. (Some countries, such as the United States, limit protection to sites with physical manifestations; however, these countries do protect traditional sites and use areas.) Once resources are discovered during inventory, the second step required of the sponsor is to distinguish between CH resources that merit protection from those that do not (termed evaluation). Those resources that merit protection move on to the third step (termed treatment), which attempts to minimize impacts to important tangible or intangible resources or to capture those values that make the resources important through a variety of activities, including scientific studies, public education, museum exhibits, festivals, oral history programs, technical reports, and popular books and articles.

At its most basic level, CHM is a service business. Depending on the requested services, a private consultancy or government agency determines the mix of expertise that will be required, the amount of time that will be needed by each position to complete each task (level of effort), and the schedule for the project team to complete the service(s). Each CHM service described earlier utilizes similar management techniques but with a slightly different project management focus. Inventory, for example, requires an assumption about how much area can be covered by a field crew in a day, how many sites will be discovered, and how long it will take to record each site. In the field, project management of inventories is all about logistics: ensuring that field crews have access to the project area; have sufficient vehicles, mapping equipment (e.g., not only that crews have global positioning system [GPS] units that meet the specifications required in the scope of work but also have Internet access to differentially corrected locational data at night), and other equipment; and have lodging and meals close to the project area to minimize travel time. Evaluation and treatment, or mitigation, projects also have field logistical requirements but in addition require substantial management of analytical and curatorial services that are performed once fieldwork is completed.

Many analytical services are provided by subcontractors, such as research laboratories (e.g., radiocarbon, palynology) or material culture analysts (e.g., ceramic, lithic, and faunal analysts), who first must be placed under contract. Subcontracts require the consultant to prepare a separate SOW/PWS/TOR for each analytical service, ensuring that all conditions of the master contract between the project sponsor and the consultant are enforced. A bid (or tender) process may ensue with one or more vendors. Managing subcontracts is different than managing internal staff in that the consultant has no direct control over the manner in which the services are provided. Management of subcontractors, often composed of specialists

spread around the world, requires ensuring that schedules are maintained and that the research focus of the overall project is adhered to as opposed to the interests of the individual specialist.

Regardless of project size, the proper tools to define the project work flow and monitor progress must be implemented from the outset. These are often outlined in the contractor's response to the original SOW/PWS/TOR and developed further after notice is given to proceed with work. It is critical that the sponsor as well as the entire project team understands the chain of command, who is responsible for what and who reports to whom. These relationships and the projected work flow are commonly outlined in a project organizational chart; Fig. 1 is a generic example of such a chart.

The first step in the management of any CHM project is the development of a work plan during the project design and mobilization phase. This plan can be informal or formal but should contain the consultant's understanding of the project, listing of project participants and their roles and responsibilities, discussion of project tasks and how they are related and sequenced and the field and analytical methods to be used, definition of the progress reporting process and format, statement of deliverables and schedule/milestones (for both client and consultant), administrative and financial procedures (e.g., communication protocols, budget and budget tracking, invoicing requirements), and reporting and curation requirements (including standard forms and formats to be used, number of iterations of report[s], metadata content and format, etc.). Gantt charts are a common management tool used to illustrate how the schedule, deliverable, and milestones will be achieved (Fig. 2). They also can be portrayed in

Cultural Heritage Management: Project Management, Fig. 1 Generic example of a staff organizational chart by project phase

ID	Example Project Schedule Referencing the Performance Work Statement (PWS)	Start	Finish	Days
1	Award	9/21/2011	9/21/2011	0d
2	Draft Work Plan (PWS Section 5.3.)	9/21/2011	9/30/2011	10d
3	Kickoff Meeting (PWS Section 5.2.)	10/7/2011	10/7/2011	0d
4	Kickoff Meeting Minutes (PWS Section 2.4. and 5.2.)	10/18/2011	10/18/2011	0d
5	Quality Control Plan (PWS Section 2.6.)	10/20/2011	10/20/2011	0d
6	Final Work Plan (PWS Section 5.3.)	10/27/2011	10/27/2011	0d
7	Safety and Health Plan (PWS Section 2.9.)	10/21/2011	10/21/2011	0d
8	Task 1 Records Review (4,000 acre survey, PWS Section 5.4.)	10/31/2011	11/14/2011	15d
9	Task 1 Fieldwork (4,000 acre survey, PWS Section 5.9.2.1.)	11/15/2011	2/12/2012	90d
10	Task 2 Fieldwork (Evaluation of 35 sites, PWS Section 5.10.2.1.)	11/15/2011	1/13/2012	60d
11	Task 3 Archival and Fieldwork (Building Inventory, PWS 5.11.2.1.)	11/15/2011	1/13/2012	60d
12	Task 2 Draft Report Writing (Evaluation of 35 sites)	1/14/2012	4/12/2012	90d
13	Task 2 Draft Report Due (Evaluation of 35 sites, PWS Section 5.10.2.2.1.)	4/13/2012	4/13/2012	0d
14	Task 3 Draft Report Writing (Building Inventory)	1/14/2012	4/12/2012	90d
15	Task 3 Draft Report Due (Building Inventory, PWS 5.11.2.2.1.)	4/13/2012	4/13/2012	0d
16	Government Review of Draft Reports (Tasks 2 and 3)	4/13/2012	5/27/2012	45d
17	Task 1 Draft Report Writing (4,000 Acre Survey)	2/13/2012	5/12/2012	90d
18	Task 1 Draft Report Due (4,000 Acre Survey, PWS Section 5.9.2.2.1.)	5/13/2012	5/13/2012	0d
19	Government Review of Draft Report (Task 1)	5/13/2012	6/26/2012	45d
20	Address Comments and Prepare Final Report and Deliverables (Tasks 2 and 3); prepare artifacts and records for curation as part of final deliverables	5/28/2012	6/10/2012	14d
21	Final Report and Deliverables (Tasks 2 and 3, PWS Sections 5.10.2.2. and 5.11.2.2. respectively)	6/11/2012	6/11/2012	0d
22	Address Comments and Prepare Final Report and Deliverables (Task 1); prepare artifacts and records for curation as part of final deliverables	6/27/2012	7/10/2012	14d
23	Final Report and Deliverables (Task 1, PWS Sections 5.9.2.2)	7/11/2012	7/11/2012	0d

Cultural Heritage Management: Project Management, Fig. 2 Generic example of a Gantt chart, a commonly used management tool for illustrating project schedule, deliverables, and milestones

a way that illustrates the "iterative" or "critical path" nature of tasks on a project. Gantt charts can also be updated as the project unfolds. Many project management software packages have a function that allows the creation of a Gantt chart. The generic example in Fig. 2 was produced using Microsoft Visio software.

CHM projects end well when the client and consultant establish similar expectations at the outset, often through a project initiation meeting where all elements of the work plan can be discussed and refined, as necessary. This step helps avoid any future conflicts or differences of opinion between the parties. Similar meetings should be held among internal team members (and any specialists or subcontractors providing services to the project) at project initiation and when key milestones are met (e.g., when fieldwork is complete and analysis and reporting are about to begin). These meetings provide the opportunity to discuss project roles, schedule, and level of effort (amount of time allotted to each person to complete their tasks and how their work relates to the larger project goals and deliverables). For nonemployee specialists or subcontractors, contracts are prepared that spell out and formalize expectations.

Most clients minimally require monthly progress reports, and they often follow specified formats (e.g., task-monitoring basis or percentage analysis) and are tied to invoicing for completed work. The progress report also allows the consultant to identify problems and issues that might affect project schedule, budget, and deliverables and bring them to the client's attention. Internally, robust accounting software is necessary to track the hours spent by employees on a particular project. These data can be used to generate management charts that provide detailed information on where a project stands on a monthly or weekly basis. These data can also be captured in a task-monitoring spreadsheet using standard software such as Microsoft Excel. Numerous project management software solutions are commercially available, and the most useful include modules for managing collaborative tasks, issue tracking, scheduling, project budget, resources (e.g., available employees, vehicles), documents, work flow, and reporting and analyses. The trend is toward web-based management, and although there are a few "open-source" tools, most are proprietary and require payment for licensing fees, upgrades, and maintenance.

In addition to tracking project schedule, budget, and deliverables, it is important to monitor project quality (see the entry on "▶ Cultural Heritage Management Quality Control and Assurance"). Most if not all of the worldwide organizations, associations, and societies focusing on cultural heritage have adopted standards that set out what a research project must achieve and define the resulting products. Many of the standards have lengthy sections on the processes that must be followed to achieve the desired results. Hinton and Jennings (2007: 102) note that these standards form the basis for a tripartite "quality management" approach, where the suitability of work is assessed and regulated by process, product, and person. A primary challenge of CHM work is balancing the traditional academic meaning of quality as "degree of excellence" (Merriam-Webster Dictionary) with more commercial meanings such as "meeting customer requirements" and "satisfying the customer" or as stated in ISO 9000 from the International Organization for Standardization (ISO) "the totality of features and characteristics of a product or service that bear on its ability to satisfy stated or implied needs" (Hinton and Jennings 2007: 101). Around the world, heritage organizations, associations, societies, and government agencies have defined the appropriate qualifications required by professionals in the various CHM roles ("person") and have created standards for the products of CHM investigations ("product"). Increasingly, commercial firms worldwide have adopted the ISO 9000 family, or series, of standards – an international consensus on good quality management practices – to address the "process" aspect of the quality management approach. ISO 9001:2015 (ISO n.d.) sets out the criteria for a quality management system, regardless of what the user organization does, its size, or whether it is in the private or public sector. It is the only one in the family of standards against which organizations can be certified, although certification is not compulsory. Over one million companies and organizations in over 170 countries are certified to ISO 9001. The

other standards in the family cover specific aspects such as fundamentals and vocabulary, performance improvements, documentation, training, and financial and economic aspects.

Although the appropriate management of CH resources is the foremost goal of CHM, conducting innovative research is an important component, especially when resources will be damaged or destroyed by a proposed development and cannot be preserved. In this regard, CHM has led to a surprising number of new and important scientific and cultural discoveries because it forces CH specialists to investigate areas often shunned by their academic counterparts. But for these discoveries to be recognized by the scientific community, they must be documented well and published in peer-reviewed academic journals, books, and monographs. When performing CHM work under contract, however, some clients claim intellectual ownership of the "products," because they have purchased them. This situation obviously presents a challenge from a knowledge dissemination perspective. Gowen (2007: 32) notes that CHM clients often have little or no perception of the need for quality in the end product of the work. As a result, it is often left to the "company culture" to govern and influence the commitment to quality.

As indicated earlier, CHM research differs markedly from typical academic research in its breadth and scope. The latter, usually constrained by small budgets and limited resources, tends to focus on one or more specific research issues and small-scale sampling using teams of student or volunteer labor that are deployed on the researcher's schedule. Impacts to CH resources may be minimal. By contrast, where CH resources are endangered by a proposed development, CHM is tasked with recovering as much important information as possible and in a rapid fashion with professional teams working on the developer's schedule. To obtain the best results, CHM data recovery or mitigation projects are done within a framework that supports a broad range of research issues that can be investigated with the type of information expected to be provided by the affected CH resources. Similarly, excavation methods must be geared to intensive sampling or even complete exposure or controlled destruction of the CH resource, while a diversity of analytical methods must be applied to a broad set of archaeological materials and specialized analyses. Finally, detailed and comprehensive reporting of all excavation and analytical methods, results, and interpretations must be completed in a timely fashion rather than be disseminated in a few journal articles as usually required in academic research.

Development of a CHM research framework also requires a solid grounding in the cultural historical background (cultural context) of the region and a good understanding of the type of CH resources that will be impacted by the development and the important information that they might contain. In countries with a well-developed archaeological and historical record, this cultural context and related research issues can be assembled from a review of existing literature. In some cases, land-managing agencies with extensive experience in managing CH resources have developed their own research frameworks based on previous research on their lands or in the adjacent regions. CHM researchers must adapt their research for a particular development project to the research issues and, in some cases, methods outlined in these preexisting frameworks. The opposite situation holds true in countries lacking a well-documented archaeological and historical record. In these situations, CHM researchers must turn to other countries or regions with similar cultural historical settings or similar CH resources to develop their research frameworks from scratch. These, in turn, are often works in progress that must be refined as the research proceeds.

The larger and more complex scale of CHM investigations also creates a greater need for managing teams with numerous researchers, research services, and their products. In academic research, the principal investigator (PI) also often serves as the project (field) director (PD), whereas in CHM PIs generally are responsible for all non-administrative aspects of the project and are aided by one or more PDs, who are charged with implementing the fieldwork portion of the work plan and for postfield reporting tasks. The role of project manager (PM) also is key on small and

large CHM projects alike. PMs are responsible for handling most if not all of the administrative tasks and for monitoring the project budget and schedule, freeing the PIs and PDs to focus on non-administrative tasks.

The broad scope of research and great diversity of specialized analyses in many CHM projects, however, often exceed the capabilities of even the most experienced PIs and PDs. Outside peer reviewers are commonly hired as subconsultants on large CHM projects to provide additional expertise in advising project researchers and providing quality assurance and independent evaluations of their work to project sponsors, government regulators, and other stakeholders. Peer reviewers usually come from academic backgrounds, and their work schedules and professional responsibilities often conflict with CHM project schedules. Thus, as with other subcontractors, it can be difficult to obtain these services within the schedule set by the project sponsor, and the quality of their input often depends on the individual peer reviewer's level of interest in the project. Many of the larger CHM consulting companies maintain teams of highly experienced analysts (often these are staff positions) to conduct a variety of materials analyses, which allows for better management of these services and better control of the research product. To respond to the research needs and possibilities of CHM projects, large CHM consultancies, such as US-based Statistical Research, Inc., have instituted the position of research director (see Fig. 1), staffed by the firm's most experienced senior archaeologists, to advise both PIs and analysts, to provide timely internal peer review as well as to coordinate more lengthy independent peer review for large CHM projects, and to ensure that project research goals are being met. Although there is still an important role for outside peer reviewers, research directors have a better understanding of the unique requirements and short time frames of CHM projects and are better integrated into the project team.

The goal of progress reporting is to show both the client and the consultants performing the work where a project stands vis-à-vis the schedule and budget. If the project cannot be completed on schedule and within budget, the consultant must make up for overages by readjusting the internal work flow. There will be times when situations arise that the client and the consultant together could not reasonably anticipate. In these situations, it may be necessary to modify the project SOW/PWS/TOR and possibly the project budget and/or schedule.

The type of contract executed between a consultant and client also influences project management (Klein and Majewski 2012). Basic contract types include (1) fixed price or lump sum and (2) time and materials and related variants. A fixed-price project is completed for a sum not subject to any adjustment. The firm receives the predetermined amount regardless of what occurs in the execution of the contract (with some exceptions for unanticipated changes of condition or scope). Fixed-price contracts provide a great incentive for a consultant to control costs and be efficient but are best suited to projects where the parameters are well known. The time-and-materials contract establishes hourly rates for specific labor categories to be used by a consultant, in addition to direct costs such as vehicle mileage reimbursement, travel, specialist services, equipment rental, field and laboratory supplies, document reproduction, and curation. This form of contract is generally used when project scope, duration, and cost cannot be estimated accurately, although initial ceilings for tasks or entire projects are generally established. Time-and-materials contracts require considerably more administrative time than do fixed-price contracts and are often phased (e.g., inventory, evaluation, and data recovery), with separate work plans and budgets developed for each phase.

Regardless of the type of contract, once final project deliverables have been submitted, a closeout review should be conducted for each project. This process identifies and documents both successes and problems encountered during the execution of the original schedule, budget, and deliverables. The results of the project closeout can serve as the foundation for improving future performance and enhancing future project outcomes.

International Perspectives

Much of the previous discussion pertains to CHM conducted in countries with a well-established CHM framework and bureaucracy. In these cases, there are specified government agencies that are charged with the responsibility for regulating CHM services and ensuring that laws protecting CH are enforced. Many developing countries, however, lack a legal framework and a CHM infrastructure. As importantly, these countries often have few, if any, trained CH specialists. Yet, many of these countries are state parties to UNESCO conventions, which require them to protect important tangible and intangible cultural heritage. Also, in response to major infrastructure projects, such as the Three Gorges Dam in China or the Namibian Lower Hydropower project in Angola, where significant cultural properties were damaged and/or destroyed, international lenders, such as the World Bank and the International Finance Corporation (IFC), now require countries to protect their tangible and intangible heritage in order to receive funds for development projects (Fleming 2010).

To meet these regulations and conventions, sponsors of development projects, such as mining companies, are requesting CHM consultancies from industrial countries to partner with in-country CHM institutions (see Gunchinsuren et al. 2011a; Rio Tinto 2011). Institutions in developing countries that are delegated CH responsibilities generally are either government agencies with scientific missions, such as institutes of archaeology, or universities with archaeology or anthropology departments. Members of these institutions may be well trained, but commonly have only performed their research as part of academic projects. Project sponsors expect foreign CH specialists to help make the transition from academic research to CHM by building CHM capacity in the host country so that in the future, in-country CH specialists can be called on to perform and regulate CHM services. In-country specialists need to understand the role of consultants as "honest brokers" of CH information and that their recommendations take into account the goals of not just the client but all CH stakeholders (e.g., government officials, regulators, local communities, elders' groups, and nongovernmental organizations [NGOs]).

The goal of foreign-domestic partnerships is to create a sustainable cultural heritage infrastructure in the developing country (see, e.g., Gunchinsuren et al. 2011b). One key is to enshrine a form of the polluter-pays model to fund CH programs in laws and regulations. To ensure that CH policies reflect public concerns, CH fees from development projects need to be sufficient not only to cover the costs of compliance projects but also to sustain community involvement, heritage education, museum maintenance and repair, and cultural festivals and activities. Additionally, the CH infrastructure must be staffed with trained specialists. Some of these specialists will be professionals in CH fields, such as archaeology, anthropology, heritage tourism, education, history, or architecture. The majority, however, will be nonprofessionals, such as staff in local museums, teachers, and heritage tour guides. Training programs need to include scholarships for advanced training in CH; most such programs are at universities in industrial countries. In addition, short training courses for nonprofessionals need to be developed, and funds need to be secured to ensure that these programs are continually available throughout the country.

Contracts for foreign-domestic partnerships in developing countries are likely to include a variety of services, including training and performing fundamental CHM services (e.g., conducting of a systematic, intensive archaeological survey), assisting in the development of a CH framework to regulate CHM services, and building CHM capacity. Because the in-country partners in many developing countries have little CHM experience, sponsors need to be realistic in their expectations. It is likely, for example, that inventory and evaluation tasks will take longer and be performed in a less-efficient manner than they would in a developed country. Also, establishing government offices with enforcement authority may require legal changes; almost certainly, it will necessitate training government personnel. In

these endeavors, the consultant must walk a fine line, for these projects are rife with potential conflicts of interest. The project sponsor's objective is to receive permission to proceed on a development project and is relying on the foreign-domestic partnership to achieve this end; the in-country partner institution, with little if any CHM experience, must produce, with the aid of the foreign specialists, a technical study meeting international standards, while a government agency, coached by the foreign specialists, must independently evaluate the study.

To be successful, these foreign-domestic CHM partnerships require strong project management. The transition from working on projects with minimal funding and essentially no deadlines to fully funded projects on very short time lines can be extremely difficult for in-country institutions with little experience with contract work and few, if any, financial cost-control mechanisms. Also, in-country institutions are generally not in a position to pay employees, acquire equipment and tools, or fund per diem and travel expenses without advanced payment. Often, the project sponsor expects the foreign consultancy to advance its in-country partner funds to meet these obligations. In addition, projects in developing countries can take place in remote regions, some of which are politically unstable. Foreign consultancies will need forms of insurance not commonly required in industrial countries, such as health policies with medivac provisions and kidnap and ransom ("extraction") insurance. All risks – economic, political, and social – need to be considered when negotiating overhead and profit fees. In addition, the management of these projects needs to include provisions for monitoring not only the technical aspects of the CHM services but also the sociopolitical climate and the economic performance of its in-country partner.

One of the keys to success in foreign-domestic CHM partnerships is to establish lines of communications at three levels: (1) between the project team and the sponsor, (2) between the foreign and domestic PIs and PMs, and (3) between foreign technical specialists and their domestic counterparts. We have found that the best way to achieve these objectives is to divide large and complex CHM projects into smaller, easily achievable tasks. Project team meetings (including translators as needed), often facilitated by Internet communication mechanisms, such as Skype, should be held at least every other week, and, if there is a large amount of project activity underway, more frequently. Difficulties in meeting project objectives or milestones need to be discussed as they are encountered with the project sponsor and, if necessary, with government regulators, local communities, and international lenders so that reasonable decisions about how to meet the sponsor's project-specific objectives and the larger CHM goals of the other stakeholders can be reached.

Future Directions

Successful CHM project management requires managers with strong leadership, problem-solving, and personnel skills and the ability to direct and influence staff to complete tasks on schedule and on budget and to implement efficiencies at all project stages, from project planning to eventual curation of the records and materials generated by the work. Until quite recently, traditional academic training for CHM professionals included little if any practical training in project management. This is changing, however, with some institutions offering summer schools/institutes or degree programs in heritage management or "practicing" archaeology. The latter programs often require internships with commercial firms or other practical experience. In the early days of CHM in any country, archaeologically trained staff performed the majority of required tasks, whether or not they were proficient in all of those tasks, including project management. As the field matures, project management has become singled out as a particular specialty that is essential for a consultancy to be successful. Many CHM firms in the United States, for example, regardless of size, now employ accountants, editors, graphic artists, and experts in cartography and geospatial technology and information technology to support traditional CHM staff and free them up to focus on the CHM aspects of projects. Senior staff members in some firms are acquiring advanced degrees in business administration to make themselves more competitive and to take

firms in new directions in terms of marketing and project management.

Above all, CHM, whether in developing or industrial countries, requires flexibility. Development plans change as do the needs and desires of local communities and other CH stakeholders. Good project management is about more than just ensuring that a project is completed within budget and on time. Management is essential to performing quality work. All too often, projects expend too much effort on field and analytical studies, leaving little time to interpret the results. Yet, the latter is essential for a CHM project to have the greatest possible scientific and public benefits (see Altschul 1997).

Cultural Heritage Objects and Their Contexts

Neil Brodie
Scottish Centre for Crime and Justice Research, University of Glasgow, Glasgow, UK

Introduction

This entry considers cultural heritage objects and their sociocultural, political, and legal contexts, and examines the implications of those contexts for understanding the past and the present.

Definition

What marks out a cultural object from an ordinary object is its "cultural worth." Cultural worth is a multifaceted concept, meaning that individual objects can be valued for different reasons by different cultures – on account of their artistic merit, their spiritual or religious significance, their historical importance, or their scientific interest (Lipe 1984). Cultural objects range in type from paintings or other recently produced works of art at one extreme, through to natural objects with no human modification at the other. It is the cultural context that affords value, the broader system of beliefs and practices enfolding the object, not the object itself. A pair of Zuni Ahayu:da (War Gods) in the context of their outdoor shrine speak of one belief system; the same pieces removed from their shrine and displayed in a museum vitrine speak of another belief system. The change of context imparts new values to the objects, which come to instantiate a larger cultural whole. Sometimes the "objects" have been forcibly removed from a larger architectural context, in which case they are really spolia. The Parthenon Marbles are an obvious case in point. Created in fifth century BCE Athens as decorative sculpture for the Parthenon temple, they are now exhibited as art objects in the British Museum. The different and sometimes competing valuations that are placed on cultural objects can impart monetary worth, and also give rise to conflicting ownership claims.

The removal of a cultural object from one context and its placement in another can cause irreparable damage to the cultural whole of which it was originally a part, while at the same time altering the value and significance of the object itself. For archaeologists, this process is of immediate concern when objects are looted from archaeological sites and sold on the art market. The archaeological context, which is necessary for their correct interpretation, is damaged or destroyed, thus constraining archaeological research and limiting what is knowable about the past. The insertion of archaeological objects into new contexts might also encourage an erroneous view of the past. The sixth century BCE "Euphronios" krater, for example, bought by the Metropolitan Museum of Art in 1972 for $1 million, is now regarded as an artistic masterpiece and a high-priced commodity, which has encouraged a view that it was similarly so regarded in antiquity. But is that interpretation correct? (Vickers and Gill 1994).

Many though not all cultural objects have archaeological value, but episodes of recontextualization may have sociocultural and political implications that go far beyond the archaeological. In the first place, they might undermine collective memory. Collective memory is an important component of ethnic and other cultural identities, and when the recontextualization of cultural objects helps to eradicate a material reminder of history, or disrupt long-established practices or beliefs, it can cause a weakening or refashioning of those identities. This process has been particularly grievous for colonized or occupied peoples, when the theft or forced sale of cultural objects has been an active or passive accompaniment of assimilation policies aimed at eradicating their identities (Vrdoljak 2006). In 1897, for example, when the British invaded and occupied of Benin ahead of creating the colony of Nigeria, they seized approximately 3,000 bronze and ivory artifacts. Many of these artifacts had comprised a visual archive, recording Benin history as far back as the twelfth century, and their removal compromised the identity of the

Benin people (Coombs 1994). Subsequently sold to defray the invasion's expenses, the Benin bronzes and ivories are now displayed in museums around the world as "art," stripped of their historical connotations and effectively depoliticized.

Like the Benin bronzes and ivories, many cultural objects that are removed from their original contexts become commodities for a time, to the financial benefit of the art market, and once curated in private collections or museums, they become capital assets, able to generate long-term income streams through visitor revenue, sale of image rights, and rent of museum space for corporate and private events. None of these benefits filter back to the countries or communities from which the objects were taken, and so, their removal can constitute a real, long-term economic loss (Brodie 2010).

Key Issues/Current Debates/Future Directions/Examples

Property Protection

The cultural and economic worth of cultural heritage objects has caused them to be placed in new sets of legal and ethical contexts, which have been developed to ensure that cultural objects remain in the possession and control of their rightful owners, whether private or public. While ostensibly protecting the rights of owners, the rationale is ultimately to protect the objects and their contexts. If objects are kept with their rightful owners, the incidence of theft is diminished and contextual damage is minimized.

There are national and international laws. On a national level, trade controls on cultural objects were first introduced in the seventeenth century by Italian city-states such as Rome and Florence, a reflection of the growing cultural prestige and economic importance of visual art at that time. By the end of the twentieth century, most countries had placed cultural objects under some kind of legislative control, ranging from weak regulation intended to prevent the export of particularly important objects, through to strong regulation that might prohibit the export of all privately owned objects and take undiscovered (archaeological) objects into public ownership (Prott and O'Keefe 1990). These national laws are usually criminal ones, and although they are intended to exert a cooling effect on would-be traders and collectors, implementing a policy of protection through deterrence, they are not merely for show. In 2005, for example, US antiquities dealer Robert Hecht and museum curator Marion True were placed on trial in Italy for conspiring to receive art stolen in contravention of Italian law (Watson and Todeschini 2007). The case against True was dismissed in 2010 without a verdict being reached. Sometimes these heritage laws can be used in conjunction with standard criminal law to prosecute cases of international smuggling. In 2003, for example, US antiquities dealer Frederick Schultz was convicted after appeal under the United States National Stolen Property Act for conspiring to deal in antiquities stolen from Egypt (Gerstenblith 2009). Customs laws can also be used to intercept traded objects. In 1997, a third century BCE gold phiale illegally exported from Italy was seized by US Customs from the home of US collector Michael Steinhardt because of false declarations on import documents, which recorded Switzerland, rather than Italy, as the country of origin. In 1999, a US court ordered that the phiale should be returned to Italy (Lyons 2002).

The international interest in protecting cultural objects can be traced back to eighteenth century concerns about the damaging effects of war on civilian life and property. In 1815, Wellington, who together with Blucher had finally vanquished Napoleon at Waterloo, declared that Napoleon's plunder of cultural objects from museums and collections around Europe had been "contrary to the practice of civilized warfare" (Miles 2008: 332). A series of military codes and international agreements followed, establishing the principle that cultural objects should not be looted or destroyed in wartime, culminating in 1954 with the Hague Convention on the Protection of Cultural Property in the Event of Armed Conflict and its First Protocol, with a Second Protocol added in 1999. The main body of the 1954 Hague Convention is concerned to protect cultural sites and monuments from damage during wartime. The

First Protocol, however, places obligations on occupying powers to prevent the export of cultural objects from occupied territory and to seize any exported material for return after the close of hostilities. It states specifically that cultural objects cannot be retained by occupying powers as war reparations. The Second Protocol establishes that any violation of these requirements should be prosecuted as a criminal offense. However, the obligations contained in the Convention and its Protocols are binding only on states that are party to them. At the time of the Coalition invasion of Iraq in 2003, for example, neither the United States nor the United Kingdom had ratified the 1954 Hague Convention or either of its two Protocols, and so were not bound to take action against the trade in looted archaeological and other cultural objects from Iraq that flourished during the invasion and its immediate aftermath. (The United States subsequently ratified the Convention but neither of its two Protocols in 2009).

The 1954 Hague Convention was drafted in light of the widespread theft and misappropriation of cultural objects by the Nazis in occupied Europe during the Second World War. By the 1960s, however, it was evident that a large and growing peacetime market in cultural objects was causing the plunder of cultural sites on a global scale. Thus, in 1970, UNESCO adopted the Convention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Ownership of Cultural Property. Among other things, the 1970 UNESCO Convention places obligations on state parties to prohibit the import of stolen or illegally traded cultural objects from other state parties, and to recover and return such material when requested by the dispossessed state. Again, the reciprocal obligations imposed by this Convention only exist between states that are party to it. The United States has implemented Articles 7b and 9 of the 1970 Convention by the 1983 Convention on Cultural Property Implementation Act. This Act enables the United States to enter into bilateral agreements with other state parties to place import restrictions on declared categories of cultural objects shown to be in jeopardy of plunder and illegal trade (Kouroupas 2009). The 1970 UNESCO Convention was augmented in 1995 by the UNIDROIT Convention on Stolen or Illegally Exported Cultural Objects which is designed to harmonize international differences in limitation periods and "good faith" acquisitions that were not addressed in the 1970 Convention.

The continuing creation and extension of laws aimed at defining and protecting cultural heritage objects have in turn created further problems and inequalities. First, there is the issue of unequal recognition and enforcement. Typically, the trade in cultural objects proceeds from poorer countries at source to richer countries at destination. Source country laws are routinely broken, in part, because in destination countries, they are either not enforced by police and customs agencies, ignored by individual or institutional collectors, or not recognized by the judiciary. This failure of destination countries to respect or enforce source country laws may be due more to resource shortfalls than policy, but nevertheless violates source country sovereignty, and might suggest that source countries are not regarded as fully equal members of the international community. Secondly, there is the issue of broader criminalization. Outlawing the trade in cultural objects makes criminals of those who do the buying and selling, and opens it up to further criminal penetration. Thus, it is suspected that the trade might on occasion be implicated in other organized criminal activities such as fraud and money laundering. Links with drug smuggling have been demonstrated in Latin America, and it has been shown in Afghanistan that money derived from the trade goes to support armed groups. In view of these potentially broader criminal associations, the UN is considering placing the trade under the purview of its 2000 Convention against Transnational Organized Crime (Manacorda 2011).

The fact that illicit trade of cultural objects persists in the face of statutory regulation, which in turn creates its own criminal problems, emphasizes the importance of non-legislative approaches to protection. Most commercial and professional organizations that engage with cultural objects now have codes of ethics or practice that are intended to provide a normative guide for their members and minimize activities that are likely to have damaging consequences. Again, like laws, these codes vary in the strength of their requirements, the nature of their enforcement, and the degree to which they

are respected. For example, the Association of Art Museum Directors (AAMD), which is the professional organization representing most art museums in the United States, had for decades required a much weaker standard as regards the acquisition of cultural objects than the International Council of Museums, to which many AAMD members were also affiliated. It was not until the Italian authorities threatened criminal prosecution of some museum staff suspected of malpractice that the AAMD adopted a much stronger code in 2008.

Human Rights Protection

The national and international laws and ethical codes discussed so far that are intended to prevent the illegal movement of cultural objects create and/or protect a property right, and in so doing defend the status quo. They are not retroactive in effect, meaning that their sanctions apply only to acts committed after the time of their implementation. Thus, although Greece would have recourse under the 1970 UNESCO Convention to claim the return from a another state party of any object removed from Greece illegally after the date of Greece's accession (1981) and that of the state concerned, it cannot claim any object that was moved out of Greece before those dates. It cannot claim, for example, the return of the Parthenon Marbles, which were removed from Greece in the early nineteenth century, many decades before the UNESCO Convention was even thought about. This non-retroactivity of laws designed to protect cultural objects is aggravating for communities or states that were dispossessed of objects in the past, as it protects the ownership of those that have come into possession of the objects while offering no opportunity for restitution or repatriation. The Parthenon marbles are again a case in point – while Greece has no claim for repatriation under the 1970 UNESCO Convention, paradoxically the same Convention actually protects the ownership of the British Museum. The most contentious ownership circumstances of this sort hold over from nineteenth and early twentieth century episodes of colonial occupation or settlement. Cultural objects were often collected by missionaries or military personnel and later anthropologists for study and display in universities and museums. Whether intentionally or not, the removal of these objects from their original contexts compromised traditional identities and belief systems, thus diminishing political cohesion and facilitating the construction and imposition of colonial or settler society by the occupying powers. The case of Benin has already been mentioned. Their continuing alienation of these cultural objects is a source of grievance, symbolic of the act of colonization itself and constituting a real cultural and economic loss.

By the late twentieth century, Indigenous communities were expressing their dissatisfaction at this inequity of the established legal regime, which from their perspective did little more than legitimize their dispossession. They began to articulate a new type of argument around the idea of restorative justice, whereby in this instance the return of cultural objects would offer some redress for injustices suffered during the period of colonial settlement and help reconstruct Indigenous identities and societies. Typical of this new approach is the 1990 Native American Graves Protection and Repatriation Act (NAGPRA), which applies to human remains and cultural objects. As regards cultural objects, it vests ownership of objects found on federal land with the appropriate Native American tribe, and makes provision for the restitution of previously taken objects from the possession of federal or federally funded institutions. In that NAGPRA restores to Native Americans some fundamental civil liberties, such as freedom of religion and cultural expression, it has been characterized as human rights legislation, in contrast to the emphasis on property rights of previous legislation (Nafziger 2009). In other countries without specially drafted legislation, a similar end is sought through negotiation and sympathetic interpretations of already established laws.

NAGPRA instrumentalizes the principle of self-determination, restoring in part to Native Americans the right to pursue their own sociocultural (though not fully sovereign) development. Recognition of this principle has been extended internationally by the 2007 UN Declaration on the Rights of Indigenous Peoples. It is noticeable, however, that while the protection and repatriation of cultural objects is seen to be fundamental to the sociocultural self-determination of Indigenous peoples, no similar recognition has been afforded

to postcolonial states. Despite an impassioned plea by the then Director-General of UNESCO in 1978, in which he observed that "The power of the *fait accompli* is a survival of barbaric times and a source of resentment and discord which prejudices the establishment of lasting peace and harmony between nations" (M'Bow 1978), UNESCO has so far failed to provide an appropriate convention (Prott 2009). Thus, while many postcolonial states have achieved political autonomy, without full sociocultural self-determination of the type increasingly being won by Indigenous peoples, in an international context, they cannot be said to have achieved full political equality.

Conclusion

The idea of the cultural heritage object is a recent one, gathering together within a single term and concept types of object that in the past would have been considered and treated differently. The idea, for example, that the Mona Lisa, painted in the sixteenth century by Leonardo da Vinci, and the Willamette Meteorite, sacred to the Grande Ronde Confederation of Oregon, have much in common would have seemed outlandish, which is why the Mona Lisa is on display in an art museum (the Louvre) while the Meteorite can be seen in a science museum (the American Museum of Natural History). What these objects have in common, however, is their cultural worth. Their value is not intrinsic, it is culturally constructed. The idea of the cultural object reflects a growing dissatisfaction with taxonomies of "the other" established in Europe during the centuries following the Renaissance. Once thought to be absolute, these taxonomies are now recognized as political as much as rational constructs, and the ongoing debates over the significance and ownership of cultural objects are at the end of the day a symptom of this recognition.

Cultural Heritage Outreach

Krysta Ryzewski
Department of Anthropology, Wayne State University, Detroit, MI, USA

Introduction and Definition

Cultural heritage outreach is an active, context-specific, and multilateral process in which practitioners and stakeholders work together to define and develop both tangible and intangible aspects of an area's heritage. This is an organic process that involves intersections between research, education, and dialogue. Within the field of archaeology, context-specific cultural heritage outreach permits relationships to develop in conventional locations of site-based archaeological research but also in locations that are well beyond the traditional domain of archaeological fieldwork, including virtual spaces, prisons, and post-disaster settings. A primary goal of cultural heritage outreach within archaeology is to encourage accountability on the part of archaeologists, particularly in engaging the multiple voices within stakeholder communities through regular discussion, debate, and strategizing. As Jameson (1994) notes, cultural heritage outreach is an imperative to archaeological practice; it is the foundation for sustainable archaeological practice and the vehicle through which non-archaeologists can participate in crafting the visions of their cultural heritage, past and present.

Key Issues

Background

Over the past two decades, the growing literature on community archaeology has advocated for recognition of the plurality of publics in cultural heritage outreach efforts and a concomitant need for increased multiplicity in approaches for studying and interpreting the past (McManamon 2005). No longer is it desirable or appropriate for archaeologists to design top-down, structured engagements that maintain an authoritative distance between practitioners and nonspecialists.

Notable early efforts to involve stakeholder communities in the design and interpretation of archaeological projects were in place as early as 1966 during the excavations of the Ozette site in northwestern Washington, when archaeologists and the local Makah Indians worked together in developing recovery, interpretation, and outreach strategies. During the 1970s, archaeologist James Deetz established a precedent for outreach-based practice, when, during the excavations of Parting Ways, he worked in close collaboration with the African American community in Massachusetts, some of whom were descended from the site's historical inhabitants (Deetz 1996).

The 1990s was the turning point for the integration of cultural heritage outreach into the design of archaeological research initiatives. Following the passage of NAGPRA in 1990, issues

of collaborative practice, outreach, and accountability became frequent topics of discussion and, more gradually, essential components of professional training within the discipline. In the United States, early discussions about heritage outreach initially took the form of short commentaries featured in the "Working Together" column of the Society for American Archaeology's newsletter publication, *The SAA Bulletin* (now called *The Archaeological Record*). Many of these commentaries are now recognized as pioneering steps toward the development of collaborative archaeological practice within the USA (e.g., McManamon 1991; Jameson 1994).

Academic training in cultural heritage or archaeological heritage management in US universities was slower to develop than in the United Kingdom, which witnessed a fluorescence of archaeological heritage programs during the 1990s at the University of York, University College London, and the University of Cambridge, among others. As these programs grew into larger research entities, such as the Centre for Applied Heritage Studies at York, positions toward and training in heritage outreach practices became more integrated with archaeological practice internationally.

In the United States, the integration of cultural heritage outreach into archaeological practice was due in no small part to the enactment of the Society for American Archaeology's Code of Ethics in 1996. Public outreach was Principle 4 of the Code of Ethics. It advised that all professional archaeologists should "reach out to and participate in cooperative efforts with others interested in the archaeological record with the aim of improving the preservation, protection, and interpretation of the record" (SAA 1996). In raising the expectations for engaged archaeological practice, the SAA Code of Ethics outreach principle encouraged the development of heritage outreach strategies of varying scale and duration along what Colwell-Chanthaphonh and Ferguson call the "collaborative continuum" of archaeological practice (2008: 1).

As evidenced in the development of academic programs, new approaches in cultural resource management, modified museum policies, and cultural heritage outreach initiatives have proliferated over the past decade and have certainly changed how archaeology is both taught and practiced. Through a series of publications including *Common Ground, CRM Journal, and Heritage News*, the National Parks Service Public Outreach Program implements communication strategies to promote cultural resource awareness and preservation across a range of professional and lay audiences. Similarly, UNESCO's Movable Heritage Outreach Program promotes the proper preservation, handling, and documentation of tangible heritage objects through a series of bilingual comic strip books called "Cultural Heritage Protection Handbooks".

Since 2000, several major centers for heritage studies have been established in the United States in which archaeology and outreach are integral components. These include the Center for Heritage Resource Studies at the University of Maryland (2000), the Center for Heritage and Archaeological Studies at Montclair State University in New Jersey (2007), The Penn Cultural Heritage Center at the University of Pennsylvania (2008), and the Center for Heritage and Society at the University of Massachusetts, Amherst (2009).

Within this new climate, where archaeological training, research, and heritage outreach are increasingly inseparable, researchers are building strategies for outreach and participating in collaborative practice from the inception of their archaeological fieldwork. Two successful examples include Carol McDavid's decade-long work at the Levi-Jordan plantation and the plantation's descendant communities in Texas (2011). McDavid's work underscores the importance of long-term involvement in the community that archaeologists must undertake in implementing certain types of productive outreach strategies. This level of commitment has proven integral to McDavid's success in building mutual respect among the Levi-Jordan stakeholders, in understanding local knowledge, and in balancing the multiple voices and difference in promoting an inclusive view of the past. Extending the use of outreach as an archaeological methodology, Sonya Atalay has implemented what she calls community-based participatory research (CBPR) at Çatalhöyükin Turkey (Atalay 2010).

Atalay involved local communities in the management, care, and development of the site by developing an internship program in which archaeologists and the community members engaged in a mutually beneficial and reciprocal training process, one that shared power while integrating local knowledge into applied research. The primary advantage of these two (and similar) outreach designs is that they pay attention to contemporary concerns within the historical context of their research (McDavid 2011).

Today it is not desirable or appropriate for archaeologists to design top-down, structured outreach engagements that maintain an authoritative distance between practitioners and nonspecialists. Instead, cultural heritage outreach is increasingly based on the development of context-specific initiatives that are interactive, mutually beneficial strategies for fostering collaborative practice and sustainable archaeological stewardship.

Examples

Cultural heritage outreach exists in many forms and scales within archaeological practice; it can be experiential, overtly political, or descriptive; a one-time occasion; or a long-term initiative. Examples can include participation in or open days at excavations, school visits, town hall meetings, radio or TV interviews, coauthorship on reports or articles, internships, collaborative project design, exhibit development, or the creation of educational curricula. There is no prescribed method or set of steps that archaeologists are expected to follow in proceeding with heritage outreach. By necessity, this is a flexible process of engagement because, as Pyburn (2010) notes, communities are complex and fluid, with people belonging to multiple communities simultaneously.

As the following examples illustrate, context-specific cultural heritage outreach permits communication and collaborative relationships to develop in conventional locations of site-based archaeological investigations but also in scenarios where such outreach activities remain less well-established or involved: occasions where archaeological research is less fixed (e.g., survey projects), where archaeology is conducted and presented in highly visible public places (e.g., urban settings, university campuses, or on the internet), when archaeology is differentially accepted by local stakeholders (e.g., political situations), or when archaeological work intersects with highly sensitive, emotional circumstances (e.g., in the wake of mass disasters).

The Maya Area Cultural Heritage Initiative (MACHI), developed in 2006 by Patricia McAnany of the University of North Carolina at Chapel Hill and directed by Shoshaunna Parks of UNC-Chapel Hill, exemplifies the potential benefits of the multilateral nature of outreach activities. MACHI has created seven separate educational programs focused on mapping places of local heritage in the Maya region of Mesoamerica. These heritage maps are created as local community members identify heritage places and community boundaries, and then chart their location using icon-driven GPS software (Parks et al. 2006). In addition to identifying over a hundred types of heritage and archaeological sites, MACHI's outreach activities have resulted in the creation of a youth radio program in Belize focused on Maya heritage and have integrated local involvement into the planning processes for future development projects in the Maya region.

Cultural heritage outreach is also a valuable tool for engaging with seemingly more familiar places and pasts in high-visibility venues. For example, a recent increase in campus-based archaeology projects, as chronicled in *Beneath the Ivory Tower: The Archaeology of Academia* (Skowronek and Lewis 2010), demonstrates how well small-scale excavations of archaeological sites on university campuses connect with the students and alumni in the university community, many of whom feel lasting ties to the place where they spent 3 or 4 years of study. Although many of the campus archaeology finds tend to predate current student or recent alumni communities, these projects are a form of outreach that illustrates how particular places reinforce the collective identity that comes with the membership of a university's community or culture. One additional advantage of campus archaeology projects is that they are

often taught as a field methods course or field school, during which students are trained in archaeological methods of excavation, recovery, and interpretation. Although the majority of student participants do not pursue careers in archaeology, this engagement is a type of outreach that trains students to become informed advocates for the archaeological process.

Digital modes of engagement offer even higher-visibility platforms for outreach initiatives. Examples range from the documentation of individual excavation projects to databases of classroom resources for teachers. One innovative form of cyber engagement is the virtual reconstruction of Çatalhöyük in 3D and on Second Life, developed by Ruth Tringham, Colleen Morgan, Daniel Wei, and Mark Moglenat the University of California Berkeley (Morgan 2009). The Remixing Çatalhöyük website is part of the Open Knowledge and Public Interest (OKAPI) Scholar's Box, an open access digital collection designed to facilitate sharing between academic institutions, libraries, museums, and K-12 students. In addition to experimental and high-tech uses of digital media in outreach activities, archaeologists have developed countless easily accessible blogs and websites as means of initiating collaborations and discussing recent finds; examples include the African Diaspora Newsletter (http://www.diaspora.uiuc.edu/newsletter.html) and Archaeology (www.archaeolog.org). Open access to digital media enables rapid dissemination of information and the possibilities for interactive discussion forums, making digital media an indispensible mode of outreach.

Cultural heritage outreach in archaeology often conjures images of welcoming, progressive, and participatory collaborations. But outreach is also a means of engaging with and addressing more sensitive, painful issues that shape communities' cultural heritage. Engaging with these issues can involve encountering those who do not want to participate in the process, those who are not yet ready (or present) to participate, or those who have been excluded by other members of the community. The history of the African Burial Ground excavations beginning in the late 1990s vividly details such tensions as the project transitioned (at the community's urging) to a focus that involved the creation of knowledge about the archaeological and cultural heritage of the Burial Ground in the service of the community (Perry 1999). A result of the outreach collaborations is that the recently opened African Burial Ground Museum is supported by an Office for Public Education and Interpretation, whose remit is to develop and continue heritage outreach initiatives. Additional examples of outreach in more challenging contexts include work in sensitive political situations and in the process of post-disaster recovery. In her contemporary archaeological research of the Long Kesh/Maze prison in Northern Ireland, Laura McAtackney collected oral histories from both former Republican and Loyalists prisoners in order to understand the experiences of the prison in connection with different groups and to inform how heritage professionals might approach the interpretation of contentious sites in general (McAtackney 2008). Heritage outreach also has an important role to play in the processes of coping, recovery, and memory in post-disaster situations. Two settings are Shannon Dawdy's (2006) work with the communities and destruction of the built environment in post-Katrina New Orleans, and Krysta Ryzewski and John F. Cherry's (2012) collaboration on the Caribbean island of Montserrat with the Montserrat National Trust in the identification protection of archaeological and heritage sites the wake of ongoing volcanic eruptions.

Future Directions

Cultural heritage outreach is now inseparable from most archaeological projects, but it is not a constrained set of practices or even a single, established methodology. Outreach is a context-specific form of practice, and, to operate well, it demands flexibility. As Paul Shackel reminds archaeologists, the results of outreach are neither automatic nor guaranteed (2011: 1). At any moment, an archaeologist working within an engaged community can be called upon to become involved at a number of different levels –

as an academic expert, as a liaison between the community and larger issues, or as a commentator on larger issues beyond the discipline (see McDavid 2011). In accordance with ethical principles of professional archaeological practice, archaeologists are responsible for recognizing and responding to the many publics who exist for archaeology by implementing effective strategies of outreach (SAA 1996). The process of practicing socially responsible and transparent modes of engagement is critical for establishing and maintaining the relationships that make for successful and productive outreach initiatives between archaeological practitioners and non-archaeologist stakeholders.

Cultural Heritage Project Management Based on Project Management Body of Knowledge (PMBOK)

Mohammadreza Hajialikhani
Technical Section, Jahan Kowsar Co, Tehran, Iran

Introduction

This entry discusses adaptive use of "Project Management Body of Knowledge (PMBOK)" as an alternative approach for heritage sites management, so that managers of heritage sites conservation projects may utilize project management approach to cover their requirement. Comparing the PMBOK guidelines with traditional "heritage sites management" practice for conservation, PMBOK Guide may not only accommodate the traditional management responsibilities for a cultural heritage site but also may h more to suggest

for a more complete management scheme. The guide arranges a systematic procedure for management of any kind of projects, with relevant methods, techniques, and tools for a successful management.

Definition

PMI: The "Project Management Institute" is a professional institute in USA, expert in "project management," which has published books and guides regarding project management.

PMBOK Guide: "*P*roject *M*anagement *B*ody *O*f *K*nowledge" Guide is a procedure for project management developed by the "Project Management Institute (PMI)."

Project: A temporary endeavor undertaken to create a unique product, service, or result. Temporary means that every project has a definite beginning and definite end but has lasting outcome. Temporary does not necessarily mean short in duration, many projects last for several years. Projects also may often have intended and unintended social, economic, and environmental impacts that far outlast the projects themselves. Projects have progressive elaboration that accompanies the concepts of temporary and unique, meaning that it develops in steps, for example, the project scope will be broadly described early and become more explicit and detailed as project develops. (PMBOK Guide 2004).

Stakeholders: Persons or organizations (e.g., customers, sponsors, the performing organization, or the public) who are actively involved in the project or whose interests may be positively or negatively affected by the performance or completion of the project. Stakeholders may also exert influence over the project, its deliverables, and the project team members. Project stakeholders of a cultural heritage site may be client, government authorities, final users, sponsors, internal and external owners and investors, ICOMOS, environmental preservation organizations, researching institutes, universities, specialists, consultants, contractors, suppliers, workers, local people in the site and around the site, tourists and tourism agencies, site manager, performing organization, management team, public, people not directly related to the acquisition, but have influence, positively or negatively, and society.

Project Charter: A document that formally authorizes a project or a phase and documenting initial requirements that satisfy the stakeholder's needs and expectations.

Project Scope Statement: A document that describes in detail the project's deliverables and the work required to create those deliverables. The project scope statement also provides a common understanding of the project scope among project stakeholders. It may contain explicit scope exclusions that can assist managing stakeholder expectations. It enables the project team to perform more detailed planning, guides the project team's work during execution, and provides the baseline for evaluating whether requests for changes or additional work are contained within or outside the project's boundaries.

Project Management Plan: Document describing the actions necessary to define, prepare, integrate, and coordinate all subsidiary plans for the site management.

C.H.: Cultural heritage.

Key Issues

> World heritage sites . . . must be managed in such a way that they are preserved for future generations and at the same time presently made accessible to the public for its education and enjoyment. Finding the proper balance between these two demands is the difficult and important task of the World heritage site managers (Colombo ICOMOS 1993a).
> Only in a few cases around the world is there sufficient national money allocated for educating and hiring staff for the professional care, maintenance, and presentation of these great places (Colombo ICOMOS 1993b).

They have cultural values and accordingly merit special protection from the chance of erosion (Feilden and Jokilehto 1993).

The common practice for management of cultural heritage is developed and documented as *site management*; the main references used for it in this entry are "*Tourism at World Heritage Cultural Sites: The Site Manager's Handbook*, by ICOMOS

International Scientific Committee, 1993, and *Management Guideline for World Cultural Heritage Sites*, 1993, by Feilden and Jokilehto.

> Organizations perform work to achieve a set of objectives. Generally work can be categorized as either projects or operations, although the two sometimes overlap. They share the characteristics of being performed by manpower, constrained by limited resources, and also must be planned, executed, and controlled. Projects and operations differ primarily in that operations are ongoing and repetitive, while projects are temporary and unique (PMBOK Guide 2004).

Current Debates

Adapting Two Management Approaches

ICOMOS Scientific Committee (Colombo ICOMOS 1993) and also Feilden and Jokilehto suggest some guidelines for management of a cultural heritage site (Feilden and Jokilehto 1993). Summing up the guidelines suggested for cultural heritage management in the above references and comparing the mentioned responsibilities with project management areas of knowledge, it is observed that an adaptation may be recognizable. In other words, we see that most activities of the cultural heritage site management may be accommodated within some areas of project management knowledge (Hajialikhani 2006).

Defining Structure of Management Scheme

As per PMBOK Guide, the structure for cultural heritage (C.H.) site conservation projects is proposed, consisting of the below sections:

- *C.H. Site Integration Management shall include:*
  - Developing C.H. site Charter, which accommodates activities like establishing a management philosophy, determining the conservation and cost control policy, determining executing organization, collection of legal documents and regulations, defining objectives and short- and long-term goals, defining relation between visitors and local population, and improving local economic relations.
  - Developing C.H. Site Scope Statement, which accommodates activities like determining method of managing the site from organizational point of view and professionals required, collection of basic data, reports about present situation, determining minimum required conservation measures by considering values and priorities, submission of suggestion with least loss, noting limits and obstacles, and conservation and protection of cultural resources as a priority.
  - Developing C.H. Site Management Plan, which includes activities like developing site management plan, documentation, and listing procedure for all the monuments, buildings, and their appurtenances and site views; categorizing and evaluating resources; determining priorities for future measures; studying relation between visitors and local population; determining the communication management policy; developing research and study plan; scheduling the major activities; reporting investigations; researching and studying previous measures; submission of management plan for approval; reporting about planning and implementation documents; and developing yearly plans.
  - Directing the C.H. Site Execution, which includes basic measures, and execution according to management plan, and documentation of carried works.
  - Monitoring and Controlling C.H. Site Works, which accommodates reporting during execution (short- and long-term reporting).
  - Integrated Change Control, which accommodates reviewing the plan, future planning, and developing and updating management plan.
  - C.H. Site Activities Closing, which has not been discussed in the cultural heritage site management. It may be due to the reason that normally no end is considered for conservation of cultural heritage sites, but if the site is to be conserved for the purpose of adaptive use or any other economical utilization by private sector, an end shall be defined for the project type activities.

- *C.H. Site Scope Management* includes site description and scope definition; defining works boundary, land use plan, conservation plan, utilities and service plan, community development plan, and tourism plan its coordination with of conservation; primarily estimate of the site; identifying, taking an inventory and evaluation of existing resources; documenting and listing all the monuments, buildings, and their appurtenances and site views; determining minimum required conservation measures; considering values, priorities, and suggestion with least loss; and identifying limits and obstacles of the project.
- *C.H. Site Time Management* schedules by identifying the problems and priorities for urgent, medium-term, and long-term works.
- *C.H. Site Cost Management* covers cost estimating and approving cost plan, cost budgeting according to similar previous works, and cost control.
- *C.H. Site Quality Management* includes implementing conservation policy; collection of the latest technical and conservational regulations; and considering values, priorities, and giving suggestion with least loss.
- *C.H. Site Human Resource Management* accommodates activities like planning the existing staff, determining staff responsibilities, staffing the human resources, studying management success, and determining consulting methods and the consulting team.
- *C.H. Site Communication Management* may cover proper documentation of the resource, assuring accessibility of the documents, and keeping copy of the documents in a safe place; communicating with universities and research institutes; communicating with international organization concerned with conservation of cultural heritage sites (like ICOMOS), documentation and reporting, and storing information and documents.
- *C.H. Site Risk Management* covers activities like reporting the potential risks that may be encountered in future, developing accident and fire protecting plan, determining the responsible person and his substitute, and studying reasons of possible failure of regulations.
- *C.H. Site Procurement Management* is not discussed in the cultural heritage site management guidelines, although procurement of material and services shall be surely required for execution of conservation works.
- *C.H. Site Safety Management* covers activities such as developing accident and fire protection plan, determining the responsible person and his substitute, and establishing management policy according to security and insurance considerations.
- *C.H. Site Environmental Management* covers processes such as studying local economic relations, studying relation between visitors and local population, and applying national and local master plans and industrial zoning.
- *C.H. Site Financial Management* accommodates activities of income budgeting, reporting the requests for financial and technical supports, improving local economic relations, and management of visitors' related activities (image and marketing, recording and analyzing visitors, moving travelers to and from the sites, welcoming visitors, providing services to visitors, and interpretation of the site to visitors.)
- *C.H. Site Claim Management* is not discussed in cultural heritage site management guides. It shall be noted that conservation of C.H. sites is often accompanied with excavation, exploring, removal of debris, and communicating with local inhabitants that may be relocate from the site and other uncertainties and risks which may affect the work procedure and progress. Therefore, there is always potential of raising claims by the client, financers, local people, contractors, etc. Thus, claim management may be helpful for the cultural heritage site management.

Future Directions

Proposed Management Scheme

The main documents, which enlighten the management procedure, are proposed by adding the

Cultural Heritage Project Management Based on Project Management Body of Knowledge (PMBOK),
Fig. 1 Preparing management Scheme

guidelines for project management and cultural heritage site management. Due to space limitation, they are presented very briefly in this entry. There are three major documents described within the PMBOK Guide and each has a specific purpose (PMBOK Guide 2004):

- C.H. Site Charter formally authorizes the project and provides the project manager with the authority to apply organizational resources to project activities. Project charter needs 3 major inputs (see Fig. 1).
- C.H. Site Scope Statement states what work is to be accomplished and what deliverables need to be produced.
- C.H. Site Management Plan states how the work will be performed and consists of subsidiary plans (Scope Management Plan, Schedule M.P., Cost M.P., Quality M.P., Staffing M.P., Communication M.P., Risk M.P., Procurement M.P., Safety M.P., Environmental M.P., and Financial M.P.)

Therefore, in order to develop a cultural heritage conservation project scheme, we shall collect main inputs of:

- Cultural Heritage Organizational Process Assets, which have been prepared or practiced before in the organization, such as quality assets (ICOMOS and other national and international charters, standards and regulations), standards, guidelines, templates, cost and accounting control regulation, countries laws and regulations, documentation and communication requirements, etc.
- Statement of Work (SOW), which is a narrative description of products or services to be supplied by the project. It may be submitted by the project sponsor, including items such as product scope description, business need, project stakeholders, and organization strategic plan
- Enterprise Environmental Factors, which are environmental factors and systems that surround and influence the project's success, such as organizational culture and structure, governmental or industry standards (tourism standards, product standards, quality standards, and workmanship standards), available site infrastructure (existing human resources, marketplace conditions), stakeholder risk tolerances, commercial databases, and environmental data (climate, soil, geotechnical, tectonic, culture of surrounding people, etc.)

And the output shall be the project management scheme consisting of the below items. Due to lack of space, just a few headings are mentioned:

Project Charter

This document shall address items such as requirements that satisfy sponsor and other stakeholder needs and expectations, establishing management philosophy, determining the conservation policy, collection of legal documents and regulations, defining objectives and short- and long-term goals, summary of milestone

schedule, defining relation between visitors and local population, improving local economic relations, defining business needs and high-level project description, determining product requirements and project purpose, assigning project manager and authority level, determining executing organization, determining project stakeholders and their influences (also their functional organizations and their participation), organizational and environmental assumptions and constraints, business case justifying the project (including return on investment), and summary budget (determining cost control policy).

Project Scope Statement

This document shall address items such as project and product objectives, product or service requirements and characteristics, product acceptance criteria, project boundaries, project requirements and deliverables, project constraints, project assumptions, initial defined risks, schedule milestones (such as investigation periods, considering weather, or tourist season), initial WBS, project configuration management requirements, approval requirements, collection of basic data, reports about present situation, determining minimum required conservation measures by considering values and priorities, submission of suggestion with least loss, noting limits and obstacles, and conservation and protection of cultural resources as a priority.

Developing Project Management Plan

This document shall address items such as the project management processes selected by management team and level of implementation, how the selected processes will be used to manage the specific project (including the dependencies and interactions among those processes and the essential inputs and outputs), descriptions of the tools and techniques to be used for accomplishing those processes, how work will be executed to accomplish the project objectives, how changes will be monitored and controlled, how integrity of the performance measurement baselines will be maintained and used, the need and techniques for communication among stakeholders, developing research and study plan, studying relation between visitors and local population, reporting investigations, studying previous measures, the selected project life cycle (and for multiphase projects, the associated project phases), key management reviews for content (also extent and timing to facilitate addressing open issues and pending decisions), documentation of procedure for all monuments and buildings and their appurtenances and site views, categorizing and evaluating resources, scheduling the major activities, determine priorities for future measures, developing yearly plans, submission of management plan for approval, reporting about planning and implementation documents, risk register (including probable risks, their possible influences, probability of occurrence, possible response to them, etc.), project management plan, and other components such as milestone list, resource calendar, schedule baseline, cost baseline, and quality baseline.

Project management plan itself may be composed of subsidiary plans and other components:

- Project scope management plan: describes how the project scope (and boundary) will be defined, verified and controlled, and how the work breakdown structure will be defined
- Schedule management plan: describes how to developing and controlling the project schedule (timing)
- Cost management plan: how cost estimate, control and budgeting shall be done
- Quality management plan: how implement the performing organization's quality policy
- Staffing management plan: how and when project team members will be acquired and released, and addresses to identification of training needs, plans for recognition and rewards, compliance considerations, safety issues, and impact on the organization
- Communication management plan: describes communications needs and expectations for the project, how and in what format information will be communicated, when and where each communication will be made, and who is responsible for each type of communication
- Risk management plan: how to schedule, plan, identify, analyze, and respond to risks

- Procurement management plan: how the procurement processes will be managed
- Project safety plan: guides and recommend how to perform the work to reduce accidents, protect workers, public and properties from probable damages
- Environmental Management plan: describes how to assess environmental conditions and impacts of project on surrounding environment and vice versa, which environmental standards and concepts shall be satisfy and how to be satisfied
- Financial management plan: defining financial status, economic conditions, source of funds, possible incomes and their probable time, visitor's management, etc.

With the help of the above structure, it is expected to have an alternative systematic method for management of a cultural heritage site.

Cultural Heritage Protection: The Legal Sphere

Sherry Hutt
National NAGPRA Program, U.S. National Park Service, Washington, DC, USA

Introduction

In an overview, cultural heritage may be seen as the material remains of the past, created by human endeavor, and held preserved by nations or subset

political bodies, which are the domain of the cultural group within which they are created. The cultural group puts the items into context and imparts the meaning by which they are regarded. The political unit establishes the rules for compliance, enforcement, and resolution of claims for control or return of cultural items. The meaning and importance attached to places and items of cultural heritage are in part a product of the custom and use of the cultural group. When items are held within a group, the local understanding and cultural ethic will constrain improper use or transfer. Such internal rules are often referred to as common law. In times of war or other international actions, such as development or exploration, outside actors may not be imbued with the same ethic. Graffiti on historic sites and removal of items from sites by those for whom the site does not hold revered interest creates a need for local protection ordinances.

Definition

The legal sphere in protecting cultural heritage has at its core the ethics of the cultural group within which the items were created, have meaning and use, and intrinsic value; this exists within the context of the political units that set compliance ordinances for use, access, and transfer; enforcement actions for harmful acts; and tangible and intangible property rights protections.

Key Issues/Current Debates/Future Directions/Examples

Private Cultural Heritage and Internal Rules – The Common Law: The rules of the creating cultural group determines individual or group control, the allowable scope of internal or external knowledge dispersal, maintenance and consumption of heritage items, or their release from use, and the availability for private or public use in what is known as the marketplace. Privately held items, not made for or considered for public consumption and trade, are thus not typically brought under trademark, trade-name, or copyright protections. Those are tools for protection of property rights in the marketplace.

Within the group, there is an orderly nature of the protection and use of cultural heritage that has developed over time as the common law. The common law is that of organized, civilized, cultural groups of homogeneous thought. The common law is the rules of the group, which are so well understood, that they are not and need not be written in texts. Over time, external impacts, such as war, migration, cultural infusion, and assimilation, bring into play competing interests in property. Conflicts may arise between groups, to be resolved by those of superior ability to control. These notions play out over time and nations. The common law is assumed within the legacy of group knowledge and may be insufficient to resolve property protection issues when competing doctrines of control, or imposition of self-interest over the group, are present. It is then the role of legal code, which is statutory law, to impart order into competition for control of property.

Statutory imperatives: There are compliance laws and enforcement laws, which regulate access and use of and protection of cultural heritage, respectively. There are also laws of restitution, repatriation, and compensation, which sort out the effects of takings by war, superior imposition of action without property right, or other conflict over time.

Compliance

Compliance laws establish legal requirements for care of sites prior to infrastructure development, for prior notice to potential owners or cultural groups with an interest in a site or objects, and for permission to excavate or for other actions which will impact heritage sites or monuments. Examples of such statutes in the United States are the National Historic Preservation Act, which establishes a National Register of Historic Places for sites of significance and which together with the National Environmental Policy Act requires consideration of impact to heritage sites prior to invasive and possibly harmful action. There are also laws in the United States, France, and other countries which allow funds expended to rehabilitate or restore historic properties to be used as

income tax credits for the private owners. Typically compliance laws exist at the national level, to be effective on actions within that nation.

There are zoning laws throughout the world in countries which indicate the uses for real estate in certain areas to protect historic districts and to maintain the character of heritage sites. Even in liberal democracies, there is an ability of government to establish an aesthetic environment, using the police power of government, to regulate how a local area will be maintained. When private property is controlled willingly by the private property owner to maintain an historic façade in an historic district, the private property owner may give the permission or be compensated. Zoning most often occurs at the local level, such as locally designated historic districts.

There are also laws that enable scientific data retrieval or other extractive activities on public heritage lands for the benefit of society in addition to scientific and historical knowledge. The permits given to investigations at heritage sites confer access and/or use, but do not change ownership of heritage sites and items. Permits may be issued by a local or national authority, for lands within local or national control.

These examples are all laws to protect cultural heritage, sensitive to market demands, evolving use of land, and desires to preserve heritage. The political unit establishes the laws, but the land manager will utilize the laws as tools to regulate access and use of heritage sites, as well as to establish heritage monuments and districts on public and private lands.

Enforcement

There are enforcement laws which prohibit consumptive use of heritage assets for self-interest, damage without authority of a permit, or theft. These laws establish prosecution and punishment of wrongdoing. Punishment may include incarceration and/or a fine. An example of such a law in the United States is the Archaeological Resources Protection Act (ARPA), which established permits for lawful data retrieval and also penalties for theft, destruction, or sale of heritage items without permission. Local laws may establish fines, but laws such as ARPA are national in scope.

Enforcement of civil laws, where money damages are the issue, can be brought in court by the land manager. When the punishment includes incarceration, the action is criminal and is actually a matter assumed by the state or national court. The land manager is then a witness, an expert on the nature of the object and its heritage value, and stands in for society as the aggrieved party.

Restitution/Repatriation/Compensation

There are also laws for the resolution of competing claims to cultural heritage. If the possessor is determined not to hold a lawful ownership interest, a court may require the item be restituted to the proper owners. When there is an inability to return items, resolving owner interests may include compensation. Repatriation is the act of returning items to a cultural group. In the United States and Australia, laws require repatriation of items to indigenous people that were previously removed without permission from the indigenous group or tribe. These laws have international implications when the out-of-country rightful owner seeks to enforce their rights in the nation in which the object is held.

Examples of these laws include statutes allowing restitution for Nazi confiscated art, repatriation of cultural items by dominant society to indigenous culture, such as the Native American Graves Protection and Repatriation Act in the United States, and return of looted or conscripted items recognized by nations as protected items and listed under UNESCO Conventions for return of looted items in international commerce. Laws can also include monetary damages, when the item has been destroyed or lost. Each nation must recognize the rights of the nonnational when foreign owners pursue their rights in objects held in other nations, or nations seek restitution.

Conclusion

The concepts of community norms for cultural heritage preservation and protection through compliance and enforcement laws can be seen across nations and across time. In multicultural society, where common law or moral law notions are mixed or disregarded by individuals, the codified law can afford some protection and assign

responsibility to deter destructive action and provide some punishment and restitution, or repatriation, to resolve the interests of the victim. Good heritage management begins with knowing the extent of the heritage resource and taking steps to deter and prevent harm with barriers, signs, and public education. When reasonable means fail to protect heritage resources, and voluntary steps are not forthcoming, then the law provides incremental tools to establish protections, limit or regulate access and use, and if the need arises, to punish destructive acts.

Cultural Heritage Site Damage Assessment

Martin McAllister
Archaeological Damage Investigation and Assessment (ADIA), Missoula, MT, USA

Introduction

Cultural heritage sites throughout the world are harmed on a regular basis by unauthorized damage. This damage may be accidental or intentional and may occur in association with other authorized acts or as a result of looting or vandalism of cultural heritage sites. Inadvertent unauthorized damage from authorized activities, for example, timber harvesting, occurs when these activities exceed the scope of their allowable impacts, such as operating in areas where they are not permitted. Looting involves the theft of artifacts and other cultural materials from cultural heritage sites. This causes damage to the context of the sites through the removal of these items and the activities associated with their removal, such as unauthorized excavation. Vandalism is damage to cultural heritage sites, resulting from malicious acts, the purpose of which is to leave the perpetrator's mark on the site or to harm it solely to cause injury.

Because cultural heritage sites must be protected in order to effectively manage them now and for the future, actions to attempt to prevent unauthorized damage to them are an essential component of cultural heritage management. These actions fall into two basic categories. The first is investigation and criminal or civil prosecution of those involved the unauthorized damage. The second is education of the general public to inform them about this problem and the need to protect cultural heritage sites. Assessment of the damage to cultural heritage sites is a necessary step in investigation and prosecution actions. It is a forensic process akin to the job of the medical examiner or forensic pathologist in a homicide case.

In the United States, there are legal and professional standards for assessing damage to cultural heritage sites caused by unauthorized damage. The legal standards derive from the Archaeological Resources Protection Act (ARPA), a statue enacted by the United States Congress in 1979 (16 United States Code Section 470aa-mm). The provisions of this statute are enhanced by implementing regulations, the ARPA Uniform Regulations, that were adopted in 1984 by the four major departments of the United States government that manage cultural heritage sites. The professional standards are based on a damage assessment methodology that has been developed over the past 34 years by the author (McAllister 1981) and other archaeologists involved in this effort. Since 2000, the author's firm has presented a five-day class for archaeologists on archaeological damage assessment that has also helped to

develop professional standards. In 2003, the Society for American Archaeology (SAA), the organization that represents the majority of professional archaeologists in the United States, adopted professional standards for the determination of archaeological value, one critical component of the measures of the harm resulting from unauthorized damage (see below). Also, the United States National Park Service has published a technical brief entitled, *Archeological Resource Damage Assessment: Legal Basis and Methods* (McAllister 2007). These legal and professional standards are the basis for the discussion which follows.

This damage assessment methodology has been developed specifically for use in the United States. As will be discussed further later, it could be employed in other countries, presuming that comparable legal and professional standards for damage assessment exist in these countries.

Definition

Assessing unauthorized damage to cultural heritage sites is the process of determining the severity of harm to these sites caused by the effects of the damage. It is part of the investigation of the damage, and its results are used in the effort to prosecute those who are responsible.

Three steps are involved in the damage assessment process. The first is on-site examination and documentation of the damage. Second, the severity of harm is determined using measures accepted in the legal system. Third, a damage assessment report is prepared that describes and explains the procedures and findings of the first two steps.

Procedures

On-Site Examination and Documentation of Damage

Four operations must be accomplished in the on-site examination and documentation of unauthorized damage to cultural heritage sites, all of which involve standard archaeological data collection methods. These operations have been described as follows:

1. Identification of the … [cultural heritage] resource damage locations:
   a. Identify all damage locations.
   b. Attempt to distinguish new damage locations from old damage locations, if the latter are present.
2. Identification of the … [cultural heritage] resources damaged and the damage to them:
   a. Identify … [legally protected cultural heritage resources].
   b. Identify the damage to these resources in terms of … [prohibited] acts.
3. Measurement of the amount of … [cultural heritage] resource damage:
   a. Make accurate tape measurements of the amount of damage, unless other, more sophisticated quantification methods are available (see 3b.). To meet forensic standards of documentation, make as complete a series of measurements as possible given the time available. Either metric or English standard measurements (e.g., inches, feet, yards) may be used … Note that if the damage has extended below the surface of a site, depth measurements are important. Sufficient measurements should be made to calculate the volume of damage.
   b. Use other more sophisticated methods to quantify the amount of damage, such as total station or 3D laser scanning. More detailed measures such as these may be employed to complete an assessment, following the initial use of tape measurements.
4. Documentation of findings:
   a. Take accurate and complete notes on all aspects of the field damage assessment process.
   b. Photograph the damage locations, the … [cultural heritage] resources damaged and the damage to them.
   c. Map the damage locations.
   d. Documentation should be as detailed and objective as possible (McAllister 2007: 8–9).

Determination of Severity of Harm

In cases of unauthorized damage prosecuted under the federal law in the United States, the

severity of harm is determined using two of three measures identified in the ARPA statute, commercial value, archaeological value, and cost of restoration and repair. Criminal charges or civil penalties are based on the total monetary amount of either commercial value and cost of restoration and repair or archaeological value and cost of restoration and repair. Definitions of these values and costs are established by Section __.14 of the ARPA Uniform Regulations:

Archaeological value. For purposes of this part, the archaeological value of any archaeological resource involved in a violation of the prohibitions in § __.4 of this part or conditions of a permit issued pursuant to this part shall be the value of the information associated with the archaeological resource. This value shall be appraised in terms of the costs of the retrieval of the scientific information which would have been obtainable prior to the violation. These costs may include, but need not be limited to, the cost of preparing a research design, conducting field work, carrying out laboratory analysis, and preparing reports as would be necessary to realize the information potential (Section __.14(a)).

Commercial value. For the purposes of this part, the commercial value of any archaeological resource involved in a violation of the prohibitions in § __.4 of this part or conditions of a permit issued pursuant to this part shall be its fair market value. Where the violation has resulted in damage to the archaeological resource, the fair market value should be determined using the condition of the archaeological resource prior to the violation, to the extent that its prior condition can be ascertained (Section __.14(b)).

Cost of restoration and repair. For purposes of this part, the cost of restoration and repair of archaeological resources damaged as a result of a violation of prohibitions or conditions pursuant to this part shall be the sum of the costs already incurred for emergency restoration or repair work, plus those costs projected to be necessary to complete restoration and repair, which may include, but need not be limited to, the costs of the following:

1. Reconstruction of the archaeological resource
2. Stabilization of the archaeological resource
3. Ground contour reconstruction and surface stabilization
4. Research necessary to carry out reconstruction or stabilization
5. Physical barriers or other protective devices, necessitated by the disturbance of the archaeological resource, to protect it from further disturbance
6. Examination and analysis of the archaeological resource including recording remaining archaeological information, where necessitated by disturbance, in order to salvage remaining values which cannot be otherwise conserved
7. Reinterment of human remains in accordance with religious custom and state, local, or tribal law, where appropriate, as determined by the Federal land manager
8. Preparation of reports relating to any of the above activities (Section __.14(c))

The combination of archaeological value and cost of restoration and repair provides the most accurate measure of harm to the behavioral context of cultural heritage sites resulting from unauthorized damage. Commercial value is used primarily for artifact trafficking cases.

National Park Service Technical Brief 20 includes a step-by-step methodology for making each of these determinations and that for archaeological value is based on the SAA professional standards for this determination. These professional standards also are presented and used in the 5-day class on archaeological damage assessment offered by the author's firm. Their use in cases involving unauthorized damage to cultural heritage sites in the United States is highly recommended to archaeologists who will conduct the damage assessments.

Damage Assessment Report Preparation

Damage assessment reports for unauthorized damage to cultural heritage resources in the United States typically include the following sections:

1. Introduction
2. [Cultural Heritage] . . . Resource Description
3. Field Damage Assessment Procedures

4. [Cultural Heritage] . . . Resource Damage
5. Value and Cost Determinations
6. Conclusions
7. Summary (McAllister 2007: 22)

Information on the location of the resource may be included as part of its description or as a separate section.

Statutes prohibiting unauthorized damage to cultural heritage sites will have legal elements that must be proven for a successful criminal or civil prosecution. For example, if the statute has a definition of a cultural heritage site or resource, it will have to be shown that this definition is met. The goal of a damage assessment report is to describe and explain the procedures and findings of the examination and documentation of the damage and the determination of the severity of harm so that there is convincing proof that these legal elements are met.

Evaluation of the Damage Assessment Methodology

When used properly, the methodology for assessing unauthorized damage to cultural heritage sites developed in the United States has worked well in cases that have been charged and prosecuted under ARPA. The methodology also has been used in cases brought under other statutes of the United States that can be used to protect these sites, either in addition to or in place of the ARPA statute, such as the theft and injury of government property statutes (18 United States Code Section 641; 18 United States Code Section 1361). In addition, this methodology has been adopted for use in two relatively new United States' statutes that protect submerged cultural resource sites and paleontological resource sites, the Sunken Military Craft Act of 2004 (10 United States Code Section 113, 1401–1408) and the Paleontological Resources Preservation Act of 2009 (16 United States Code Section 470aaa-1-11). Also, it has now been codified in a new cultural heritage protection statute of the State of California (California Public Resources Code Section 5097.5-5097.993).

In a recent article, an amendment to the ARPA statute has been proposed that would extend its jurisdiction to protect submerged cultural heritage sites on the Outer Continental Shelf:

This amendment does not state that the United States has fee title to the Outer Continental Shelf but does assert our nation's sovereign rights and exclusive jurisdiction over activities controlled by ARPA that occur there. As a result, this proposed amendment would appropriately extend ARPA jurisdiction to the Outer Continental Shelf and would improve and expand protection of the extensive underwater cultural heritage located there (McAllister et al. 2011).

This would provide a firm legal basis for the use of the damage assessment methodology for unauthorized damage to these sites.

Clearly, this methodology has been shown to have broad applicability in the United States, even when the ARPA statute does not apply for definitional or jurisdictional reasons. The components of this methodology involving on-site examination and documentation of damage and preparation of a damage assessment report are standard operations that would be applicable in any legal context. Although the legal definitions of the measures of the severity of harm come directly from the ARPA Uniform Regulations, they are based on common sense or archaeological concepts that are not strictly tied to the legal system of the United States. They can be restated in simple, nonlegal terms as follows:

- Commercial value: What is the current monetary worth of an object removed from cultural heritage site without authorization?
- Archaeological value: What would have been the cost of an archaeological project to scientifically investigate the damaged portion of a cultural heritage site before the unauthorized damage occurred?
- Cost of restoration and repair: What amount of money has been or would be expended to attempt to restore the damaged portion of a cultural heritage site to the condition it was in prior to when the unauthorized damage occurred?

Therefore, it is reasonable to assume that this damage assessment methodology could be used effectively in criminal or civil prosecution of those involved in unauthorized damage of cultural heritage sites in other countries.

Key Issues

Obviously, the damage assessment methodology developed in the United States can only be employed when statutes exist that prohibit unauthorized damage to cultural heritage sites and make such actions subject to criminal penalties, civil penalties, or both. The use of the damage assessment methodology in other countries would be viable presuming that statutes of this type have been or could be enacted. It cannot be employed in legal jurisdictions in which such statutes do not exist or do not apply because there are then no legal standards for the use of the methodology.

In addition to this basic issue, there are five others that will affect the use of the damage assessment methodology in any legal jurisdiction where there are statutes prohibiting and penalizing unauthorized damage to cultural heritage sites. The first two relate specifically to the practice of damage assessment while the other three are broader and affect whether or not there will be a need for damage assessment. These issues can be summarized as follows:

- A lack of professional standards for assessing damage to cultural heritage sites
- Failure by archaeologists to adhere to legal and professional standards when assessing damage to cultural heritage sites and resulting prosecutorial problems
- A lack of support from land managers for investigation and prosecution of cases of unauthorized damage to cultural heritage sites
- The failure of law enforcement officers to detect and properly investigate such cases
- A lack of interest from prosecuting attorneys in pursuing cases of unauthorized damage to cultural heritage sites which they see as a "victimless" and, therefore, less serious type of crime

Future Directions

All of the issues identified above need to be addressed in future efforts to better protect cultural heritage sites. Clearly, statutes prohibiting and penalizing unauthorized damage to these sites should be enacted in legal jurisdictions where they not exist currently. Also, existing statutes, even the venerable ARPA statute of the United States, can potentially be amended to improve their protective measures. The lack of professional standards for assessing damage to cultural heritage sites and the failure of archaeologists to follow both legal and professional standards in conducting these assessments must be addressed and acted on by the professional archaeological community in the legal jurisdiction where the sites are located. The existence of these standards and adherence to them by archaeologists should help convince land managers, law enforcement officers, and prosecuting attorneys that professionally credible and legally sustainable assessments of damages will be produced. A more difficult task is increasing the commitment of land managers, law enforcement officers, and prosecuting attorneys to the detection, investigation, and prosecution of cases of unauthorized damage to cultural heritage sites. It will require the combined efforts of descendant groups, the professional archaeological community, and supporters among the general public using a wide array of consciousness-raising strategies to convince these government officials that cultural heritage sites are irreplaceable resources that must be protected not only through public education but also through enforcement.

Summary and Conclusions

In the United States, there are legal and professional standards for assessing damage to cultural heritage sites caused by unauthorized damage. The legal standards derive from the ARPA statute and the act's Uniform Regulations. The professional standards have been formulated in conjunction with the development and use of an archaeological damage assessment methodology. The purpose of this methodology is to determine the severity of harm to these sites caused by the effects of the damage. Three steps are involved in the methodology; on-site examination and documentation of the damage, determination of the severity of harm from the damage, and

preparation of a damage assessment report. What are referred to as commercial value, archaeological value, and cost of restoration and repair are the legally established measures of harm. This damage assessment methodology is applicable not only to criminal and civil violations of the ARPA statute but also to violations of other federal or state laws that prohibit and penalize unauthorized damage to cultural heritage sites and also may be extended to damage to sites on the Outer Continental Shelf. Although there are legal and professional issues that can affect the use of the archaeological damage assessment methodology that has been developed in the United States, it certainly could be used in criminal or civil prosecution of those involved in unauthorized damage of cultural heritage sites in other countries.

Based on over 30 years of experience with this archaeological damage assessment methodology in the United States, it is known that it can be highly effective in determining the severity of harm to cultural heritage sites from unauthorized damage. Therefore, other countries should consider adopting it for use in conjunction with their existing statutes or those that may be enacted protect these sites.

Cultural Landscapes: Conservation and Preservation

Mónica Luengo[1] and Juliet Ramsay[2]
[1]ICOMOS – IFLA International Scientific Committee on Cultural Landscapes, Madrid, Spain
[2]ICOMOS – IFLA International Scientific Committee on Cultural Landscapes, Burra, NSW, Australia

Introduction

Cultural landscapes offer a way of understanding how societies interact with their environment. Built features and land modifications combined with the natural landscape are the cultural landscape expression that holds records of how communities live in time and space within a landscape. Records of human activities may extend back in time for thousands of years to tell the story of the economic organization of a long past society such as the "Kuk Early Agricultural Site", Papua New Guinea, and "Schokland and Surroundings", the Netherlands, that is land reclaimed from the sea containing vestiges of historic and prehistoric human habitation. More extensive cultural landscapes, such as the "Incense Route and Desert Cities in the Negev", Israel, combine associated fortresses and agricultural landscapes in the Negev desert with the relics of their sophisticated irrigation systems, urban constructions, forts, and caravanserai (examples from UNESCO World Heritage List 2012).

The introduction of new concepts during the twentieth century such as new ecological ideas, innovative trends in the study of geography, anthropology, and other disciplines, provided a new consideration of the landscape, especially from a cultural point of view. The long process that changed the concept of landscape resulted in the consideration of landscapes as complex living beings having physical structure, as well as immaterial, intangible values that give meaning. In the recent decades, cultural landscapes have been referred to as "historic landscapes" or "vernacular landscapes" to describe areas evidencing features constructed in the traditional style of a cultural group. The United States Park Service provides definitions of the historic and vernacular landscapes as well as ethnographic landscapes and notes that they fall under the umbrella of cultural landscapes (Birnbaun 1994).

The concept of cultural landscape that incorporated the spatial dimension along with the temporal and intangible qualities was mirrored in archaeology but in reverse. Where the important temporal and macrogeographical factors had been of importance, the local spatial dimension and intangible qualities became of increasing significance. Landscape archaeology, ideally as a multidisciplinary study, focuses on the interaction of the natural environment with human-induced

Cultural Landscapes: Conservation and Preservation, Fig. 1 An archaeological agricultural mound of the "Kuk Early Agricultural Site", Papua New Guinea. (Courtesy of The Kuk archive, Australian National University)

processes through time. It is argued that all archaeology is landscape archaeology. Archaeologists use the term "archaeological landscape" to describe landscape areas that are interpreted from scientific studies such as for the World Heritage inscription of the "Petroglyphs within the Archaeological Landscape of Tamgaly," Kazakhstan; "Gobustan Rock Art Cultural landscape," Azerbaijan (UNESCO World Heritage List); and "Kuk Early Agricultural Site" where archaeological research established human agricultural practices dating to over 6,000 years BP (Denham et al. 2004: 853) (Fig. 1).

Precedents for the term "cultural landscape" can be found in works by German and French historians and geographers, but the geographer Carl Sauer is widely cited and given credit for introducing the term in his work "Morphology of Landscape," published in 1925, where he described cultural landscapes as "culture is the agent, the natural area is the medium, the cultural landscape is the result" (Schein 2004: 13–14). Later J. Brinckerhoff Jackson in his work "Discovering the Vernacular Landscape" (1984) claimed that all landscapes are inherently cultural, so that "cultural landscape" is a pleonasm.

Since 1992 when the United Nations, Educational, Scientific and Cultural Organization (UNESCO) adopted "cultural landscapes" for describing and valuing heritage, the term has become increasingly popular. However, despite the increasing appreciation of cultural landscapes as heritage properties, in the twenty-first century, their management and conservation remains challenging.

Definition

As the term "landscape" relates to several different disciplines such as geography, anthropology, archaeology, architecture, urban planning, and regional planning, all of which offer different views and definitions, the meaning of "landscape" can be ambiguous. However, the various disciplines hold in common the understanding that landscape is an entity based on perception. The European Landscape Convention Article 1 (2000) defines landscape as "an area as perceived by people, whose character is the result of the action and interaction of natural and/or human factors". The definition adds a human perception to the classic definition of landscape, regarding landscape as a dynamic event (Zoido 2010: 207). All landscapes thus reflect the interaction between people and the environment through time and space, and therefore it can be understood that every landscape is a cultural landscape, "because humans modify the landscapes in which they live, and because they attach names, myths and affective value to features of the territory they inhabit" (Lipe 1984: 1). The landscape, therefore, can be interpreted as a dynamic code of symbols that tells us about the culture of its past, its present, and its future that may become an outstanding heritage property to be conserved for future generations. People identify with the landscape they inhabit, and therefore, the role of landscape is fundamental in the construction and consolidation of a national or regional identity.

In the 1990s and in the twenty-first century, heritage sites shifted from a predominance of monumental architecture to include landscapes of high value to communities for their spiritual and economic sustainability. To fill gaps in global heritage, the World Heritage Convention gave status to the term "cultural landscape" by introducing cultural landscapes as a category of sites within the Convention's 1992 Operational Guidelines. In 1993, "Tongariro," New Zealand, became the first cultural landscape under the Convention to be given World Heritage protection. To provide direction for identification and management, the World Heritage Convention added to their basic definition of cultural landscapes – representing the "combined works of nature and of man" – by delineating three categories of cultural landscape in the 1999 Operational Guidelines: the "clearly defined," the "organically evolved" (relict or continuing), and the "associative" (UNESCO 1999: 9–10).

Clearly defined landscapes are those designed and created intentionally by man and are usually highly modified to incorporate style ideals or planned economic exploitation such as the "Garden Kingdom of Dessau-Wörlitz," Germany;

Cultural Landscapes: Conservation and Preservation, Fig. 2 Segment of the Subak rice terraces, Bali Province, Indonesia

"Aranjuez Cultural Landscape", Spain; and the "Royal Botanic Gardens", Kew, United Kingdom. Pastoral or agrarian landscapes that may have developed over many years would be within the "continuing evolved" category. Some of the continuing evolved landscapes that retain a traditional land use practice have little modification such as the "Orkhon Valley Cultural Landscape," Mongolia, while other rural productive landscapes may express extensive surface modification that have sustained communities for generations such as the "Rice Terraces of the Philippine Cordilleras" and "the Cultural Landscape of Bali Province: the Subak System as a Manifestation of the Tri Hita Karana Philosophy" (Fig. 2). Numerous evolved landscapes are now relict such as the "Archaeological Landscape of the First Coffee Plantations", Cuba. Cultural landscapes in the associative category are generally minimally modified natural landscapes that have been utilized traditionally for hunting and gathering or, in other cases, valued for aesthetic and spiritual importance such as "Uluru-Kata Tjuta National Park," Australia; "Sacred Sites and Pilgrimage Routes in the Kii Mountain Range," Japan; and the "Koutammakou, the land of the Batammariba," Togo. (All examples are from UNESCO World Heritage List.)

The World Heritage definition and categories for cultural landscapes identify multiple points of view for consideration that bring cultural landscape close to archaeology. Cultural landscapes contain human history. They are a living memory and witnesses of past human settlements and their cultural influences, and they are currently considered as an important category of cultural heritage that is a product of the time and place of those who have created it and continue to shape it (Ashword and Tunbridge 2000: 10).

Key Issues/Current Debates/Future Directions/Examples

A fundamental problem is that the concept of a cultural landscape is still unknown in some regions, but building up an understanding of the importance of valuing cultural landscapes is increasing. The identification and description of a cultural landscape must have the full involvement and support of the local community and their traditional knowledge, particularly for describing tangible and intangible elements. Identification of heritage values must also be conducted through multidisciplinary studies. The cultural landscape of "Kuk Early Agricultural Site" notes the involvement of the Kawelka people but also how multidisciplinary archaeological, archaeobotanical, and palaeoecological research revealed a phenomenal time depth of the

agricultural practice and ancient plant domestication (discussed in detail by Tim Denham et al. 2004).

Management plans are a necessity for the conservation of cultural landscapes. Initiatives for special landscape management, that considered a property as having a heritage value, arose in the United States. Subsequently, similar management to that of natural parks developed, but with an added sociocultural component while offering an opportunity for local development. The basic premise for management plans is that cultural landscapes have dense significance that keep and convey information, and therefore, thorough research of it is an essential initial step. Detailed descriptions (inventory) of all features that form part of the heritage landscape are required and may include structures, watercourses, trees, landform features, archaeological sites, viewscapes and landscape areas, as well as their connections and interrelationships. Intangible aspects require documenting spiritual and other associative value, access to places of special meaning, past as well as current social structures, land use activities, and the linkages of these aspects with the landscape. The associative value of "Cultural Landscape of Bali Province: the Subak System as a Manifestation of the Tri Hita Karana" demonstrates a traditional and disciplined social organization that has developed over a millennium for economic sustainable production. Importantly, it is a system of people and landscape that pays homage to spiritual life forces in a series of rituals that are an integrated component of the cultural system (UNESCO World Heritage List 2012, report 1194).

Delineating a suitable boundary for cultural landscapes, but particularly those in the evolved and associative categories, requires an understanding of societies that live or have lived in the area, determining the catchment of their economic land use as well as intangible associations and relationships of communities to the surface and subsurface features. The delineated cultural landscape must contain representation of significant land use activities, cultural life, and important symbolism. Boundaries may reflect a contiguous landscape or may need to include distant-related components to capture the full heritage importance. The heritage area of "Mount Wutai," China, consists of an extensive landscape area and a distant component area, while the "Cultural Landscape of Bali Province: the Subak System as a Manifestation of the Tri Hita Karana" has five component landscape areas.

The harmonious relationships between people and their environment must be safeguarded in a management plan, and a wide range of different sectorial policies integrating traditional knowledge of local communities are needed. Management plans must respond to the needs and interests of the people and be owned by them. Communities associated with the landscape have an ongoing role in heritage management as well as ensuring that local knowledge and skills are passed on. Every case must consider how sustainable development can be adapted to specific local conditions. The Uluru-Kata Tjuta cultural landscape is a perfect example where nature and man act according to ancient rituals and customs, to a sacred law. It is the result of centuries of traditional management through *Tjukurpa*, a social code that governs the behavior of men, animals, and places for 5,000 years. The aboriginal Anangu are deeply involved in the management that includes a traditional regime of controlled fires while water sources are carefully tended, assuring the characteristic plant community. The "Richtersveld Botanical and Cultural Landscape", South Africa is owned and managed communally by the Nama people, a seminomadic population that assure the conservation of the seasonal patterns that may have persisted for as much as two millennia in southern Africa.

Defining acceptable changes with a predicted optimum outcome is a consideration for cultural landscape management planning. Conservation must also take account of distant factors essential to the health of the landscape, such as damming an upstream river that may alter the water table or water quality of the landscape. Management for natural disasters is required along with measures to moderate possible threats that can damage heritage integrity such as excessive tourism and looting of heritage objects in open landscape areas. There are numerous other issues with

regard to the conservation and protection of cultural landscapes, and the publication *Managing Cultural Landscapes* discusses many of the challenges under the chapter "Prospects and challenges for cultural landscape management" (Taylor and Lennon 2012: 345–364).

Protecting the cultural landscape can be resolved through legal measures relating to cultural heritage, such as natural heritage, town planning, territorial planning, protection of agricultural land, and protection of archaeological sites and objects. It is necessary to coordinate the various existing laws, the different administrations involved at all territorial levels, as well as the traditional governance of customary laws. Management plans require statutory ratification, while legal mandatory requirements for social value and archaeological research should be built into major development works. Other essential aspects are public awareness and specific training for the management of cultural landscapes.

Not all countries have legal measures in place. Legal framework varies in a very wide range, but not always national legislation includes specific and strong traditional land management practices that must be coupled with adequate funding to support conservation of cultural landscapes. As an example, a legal framework for conservation protection measures of the "Kuk Early Agricultural Site" is the *Organic Law on Provincial and Local Level Governments (1995/1997)* used by local communities and provincial governments to declare and protect significant traditional sites independent of the central government (http://whc.unesco.org/uploads/nominations/887.pdf).

In 2007, the UNESCO World Heritage Centre published *World Heritage – Challenges for the Millennium* in which a chapter on cultural landscapes (Labadi 2007: 112–117) highlighted the concern over the imbalance of the listed cultural landscapes with over 70% located in Europe and which reflected only positive interpretations of human practices in cultural landscapes. The listing of "Bikini Atoll," in the Marshall Islands, demonstrates a change in cultural landscape perception. The Bikini Atoll landscape exemplifies the violence exerted on the natural, geophysical, and living elements by nuclear weapons demonstrated by the damaged ecosystems and the terrestrial, marine, and underwater landscapes of Bikini Atoll. The nuclear tests changed the history of Bikini Atoll and the Marshall Islands, through the displacement of inhabitants and the human irradiation and contamination (World Heritage List 2010: report 1339).

Although the World Heritage List has inscribed many cultural landscapes, there are important unlisted cultural landscapes throughout the world that embody values of national or local importance, need protection, and are subject to similar issues as faced by World Heritage cultural landscapes. Such landscapes, often regarded as "ordinary", are vulnerable to damaging development. In many countries, the resources of cultural landscapes are being exploited to produce green energy to counter the effects of climate change and energy demands. Farming landscapes are being invaded by an ever-increasing number of industrial installations such as wind farms, electricity stanchions, natural gas infrastructure, and production of biofuels. Undertaking national or regional thematic research and preparing inventories of cultural landscapes including their subsurface layers are desirable to safeguard landscapes of heritage importance. Building a balanced heritage list of cultural landscapes globally and nationally is an ongoing challenge particularly, as many countries do not have the resources for such research.

Cultural Property, Trade, and Trafficking: Introduction

Kathryn Walker Tubb
Institute of Archaeology, University College London, London, UK

Introduction

Over the course of the past 50 years, the appetite for cultural property by individuals wanting to own a piece of the past has become voracious, resulting in damage to and destruction of countless archaeological sites, monuments, and communities. While some of the objects currently on the market have undoubtedly been in circulation before legislation was enacted to protect heritage material, the routine absence of substantial collecting histories has made it easy for recently looted artifacts to contaminate the licit trade. Consequently, the illicitly acquired material has become so intermingled with the licit, as to be indistinguishable from it.

Definition

Despite the fact that cultural heritage has become accepted as terminology that more adequately reflects the values placed on manifestations of the past, in the context of trade, cultural property better reflects the commodification that tangible remains undergo when treated as merchandise. Definitions of cultural property are provided in Article 1 of the 1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict and Article 1 of the 1970 UNESCO Convention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Ownership of Cultural Property.

Dishonest trading is implied more often than not in the use of the term trafficking.

Key Issues/Current Debates/Future Directions/Examples

It is self-evident that dealers exist to satisfy demand. Demand is hyped by advertising and skilful marketing of wares (Fig. 1). Transparency about sources of stock is largely absent. However, given the demonstrable destruction of sites and monuments, such secrecy leads to suspicion that objects on the market without provenience and verifiable collecting histories are likely to be the product of looting.

The ongoing trade in the cultural heritage of indigenous peoples, who have suffered egregious losses of their material heritage historically, damages communities and violates their cultural rights.

Many art-rich countries have national patrimony laws vesting ownership of their cultural heritage in the state. Its misappropriation is thus theft. Arguments by dealers and collectors that these states should patrol sites and control their borders more effectively are used to justify purchasing such artifacts. In addition, claims are made that without a market, metal artifacts would be melted down for bullion, and chance finds would be destroyed to avoid complications that might arise if they were to be reported to the authorities. The excellence of curation by wealthy individuals and museums is contrasted with neglect by the originating state. The corruption of officials is also cited as a reason for disregarding national laws. Archaeologists are

Cultural Property, Trade, and Trafficking: Introduction, Fig. 1 Compilation of marketed artifacts from areas in the Middle East that have been extensively looted. (Courtesy of Stuart Laidlaw)

variously decried as a self-protecting, self-seeking group more destructive than looters in failing to publish the results of their excavations. The laws themselves are criticized as retentionist, nationalistic instruments that run counter to the universal value of the cultural property for all humankind. The fact that the legislation is tied to the borders of modern nation-states is also used to question the entitlement of their current populations to the remains of the past.

Heritage professionals have challenged these arguments as imperialistic, fostering an unwillingness to acknowledge the academic and social impact of the destruction of context. Without context, the ultimate goal of scientific excavation, any potential to interpret the past is grossly diminished as associated materials, structures, environments, and so forth are sacrificed in recovering the saleable object. Scientific excavation entails documentation of the process through field records including plans, sections, site notebooks, and photographs. Summaries of excavation seasons often appear promptly, and significant finds are often exhibited shortly after discovery prior to the final publication.

Political and economic instability coupled with conflict makes for extreme vulnerability of cultural property generally with devastating consequences. This has been evident in the Sumerian city sites of southern Iraq, in the Bactrian areas of Afghanistan and Pakistan, in Syria, and in many eastern European countries such as Romania and Bulgaria, to cite but a few examples (Fig. 2).

The advocates for the trade and collectors stand in stark opposition to advocates for archaeology. Evidence that connects an individual object to a hole in the ground is usually unobtainable. This makes detection of illicitly traded material and prosecution for trafficking very unlikely. It is in the interests of the illicit trade to obscure the origins of an artifact, and this laundering is facilitated by rapid turnover preferably across national borders multiple times, a process facilitated by the Internet. This lack of information also facilitates contamination of the market with forgeries.

Until recently, concern expressed by archaeologists and heritage professionals that dealers and collectors were fuelling the destruction of archaeological sites was rebutted as anecdotal accusation without foundation.

Scholars such as Ricardo Elia (Apulian red-figure vases, 2001), Vinnie Nørstok (Greek vases, 2002), and David Gill and Christopher Chippindale (e.g., collections and exhibitions of Classical artifacts, 2000) among others have conducted research in response.

Cultural Property, Trade, and Trafficking: Introduction, Fig. 2 Aerial view of the Sumerian city-state of Isin, southern Iraq, devastated by looting, January 2004. (Courtesy of John Russell)

Of wider effect has been the exposure of a trafficking ring by the Carabinieri Tutela Patrimoniale Culturale (Watson and Todeschini 2006). Their investigation resulted in the recovery of hard evidence that has resulted in the recovery by Italy and Greece of large numbers of extremely rare and valuable artifacts from museums such as the Metropolitan Museum of Art in New York and the J. Paul Getty Museum in Malibu, California (Felch and Frammolino 2011). Here the sequence of transactions from looting an object out of the ground to its acquisition and display in illustrious establishments has been clearly and indisputably demonstrated.

Nevertheless, because of the clandestine nature of the illicit trade, it has been a difficult area to research, resulting in insufficient data being available to pronounce definitively on the scale and value of the material being exchanged. In recognition of this, the European Research Council has awarded a very substantial grant for a team of investigators from the Scottish Centre for Crime and Justice Research, University of Glasgow, to research in this area with the aim of developing strategies to enhance the protection of cultural heritage (http://www.gla.ac.uk/research/researchfeatures/headline_219877_en.html).

ICOM, the International Council of Museums, has also announced its intention to create a new entity called the International Observatory on Illicit Traffic in Cultural Goods, pending approval of funding from the European Commission (http://worldnews.nbcnews.com/_news/2012/11/14/14944606-new-intelligence-body-set-to-fight-illicit-trade-in-worlds-priceless-treasures?lite).

Culture in Archaeology

Wilhelm Londoño Díaz
Facultad de Humanidades, Programa Antropología, Universidad del Magdalena, Campus San Pedro Alejandrino, Santa Marta, Colombia

Introduction

With this entry I want to present some general ideas about the meaning of culture and how it has been used in the field of archaeology. As this tool of analysis has undergone changes throughout the history of the discipline, this entry provides a commentary on such changes and briefly introduces what constitutes the current debate regarding archaeological research objects.

Definition

It was with Emile Durkheim's work *Rules of the Sociological Method* ([1895]1994) that the systematization of the tools of analysis that enabled the investigation of society began. It is well known that within such systematization, Durkheim coined the term "social fact" to refer to the series of elements that laid the foundation of the subjects' behavior and that were exterior to the individual. The social fact had an independent existence from the subject, and thus, it was possible to investigate it scientifically or in other words sociologically. Durkheim suggested a methodological principle which would mark social and cultural research. In order to appreciate a social fact, Durkheim emphasized that it was sufficient to examine the force such facts would typically manifest when certain individuals did not respect a preestablished rule or agreement. Durkheim also argued that the study of the social facts was not related to the study of individual trajectories, a field kept for psychology; in this field, it was indeed legitimate to investigate why subjects refused to follow preliminary agreements. This individual refusal, Durkheim believed, did not detract from the fact of an agreement taken by the group as a larger whole and that this occurrence justified sociological inquiry with methods taken from the natural sciences.

The concept of shared agreements that are independent of individual subjectivity was the concept that enabled the emergence of the field of investigation in non-modern societies. This is called anthropology. In the first anthropological systematizations, such as those of British anthropologist A.R. Radcliffe-Brown (1986?), the object of anthropological investigation was defined as the relationship between subjects that does not vary even when they are absent. In Radcliffe-Brown's aforementioned work, a series of systematizations of kinship relations on a global level stand out, which proved the notion that the blood and non-blood relationships among subjects formed an organized framework independently from people. Radcliffe-Brown called this phenomena social structure. In a further account, social structure exteriority, according to Radcliffe-Brown, enabled anthropology to be a science which would not be distinguished from physics or chemistry as its object of inquiry was not limited to subjective caprice. In this sense, Radcliffe-Brown established a methodological difference between anthropology and history, in which the first was charged with identifying recurrent phenomenon that, independently of the subjects, regulated social life; the second was charged with recording specific trajectories related to literature and biography.

In the American tradition, the object of anthropological investigation was not, in fact, social structure, although some starting points such as the extrasomatic nature of culture (White 1959) were shared. It should be noted that it is in the use of the notions of culture in American anthropology where one of the most important definitions of culture comes from. It was in the 1960s that Lewis Binford published an article (Binford 1962) in which it is pointed out that archaeology is anthropology. In this text, which became mythical within the discipline's history, Binford turned to Neo-Evolutionary proposals (White 1959) pointing out that culture is an extrasomatic complex in which there are symmetric relationships between political and economic systems. That is, to a determined economic system, there is, in turn, a determined political system. However, the most interesting point in Binford's proposal was his suggestion that it was possible to think in archaeological markers of economic and even political systems; thus, it was possible to inquire about the sequences of the social change. It should be mentioned that from that perspective, social change was understood as a way to make political and economic systems complex. The approach holding that culture was an extrasomatic means of adaptation in constant evolution was called processualism.

Besides the currents which focus on the way economic systems determine political relationships, not only in archaeology but also in anthropology, there are other strands favoring subjects' active roles in social and cultural change process. Culture, from this perspective, more than being just a tool, is a kind of script, where subjects can build their histories in accordance with their individual trajectories. This tradition that considers culture as a text is more related to hermeneutics (Hodder and Hutson 2003) and privileges the closeness of archaeology to history (Hodder 1987).

In terms of definitions, it may be possible to distinguish two significant conceptualizations of culture in archaeology: one that considers culture as an extrasomatic means of adaptation and another that considers it as a text that can be used to address the process of social change (Hodder 1989). The first could summarize what is considered processualism and the other what is referred to as post-processualism (Hodder 1985).

Besides metropolitan definitions of culture, in recent years, there has been an emerging movement of non-central peripheral theory that has stressed how the traditional definitions of culture, especially those of the British and American academy, have overemphasized stability while ignoring tension and conflicts, especially those that are emerging and have emerged from colonization (Trouillot 1992). Besides the terms and methodological principles for identifying culture already mentioned, there were others that considered culture as a mechanism of political answer before colonization processes (Leone 1995). As it is stated by the hermeneutic approach, this perspective suggests moving forward from an apparent local autonomy, focusing on the effects that the colonial politics produced on local communities. These definitions of culture have interesting names such as the notion of "colonial wound" made popular by Walter Mignolo's work (Mignolo 2005). As suggested by this notion, social investigation cannot ignore the fact that there are effects produced by the attempt to erase local communities on the pretext that those communities were obstacles to development. It has to be mentioned that in these inquiries what it is studied is not the other's culture but the hegemonic processes exerted on certain communities with the excuse of civilization or development.

Current Debates

At the end of the nineteenth century, as can be appreciated in Durkheim's work, there was a concern to demarcate a discipline which would address societal issues, understanding "society" as the set of subjects inhabiting a state (Anderson 1993). The purpose was to study the complexities of a social organization that, as the state, was thought of as a natural formation, inherent to civilization's developmental stages. What could not be perceived in the nineteenth century was that the state had been a construct that had enabled the development of all components of a commercially based, manufactured, and capitalist society (Patterson 2011).

As Renato Rosaldo (1991) suggested some years ago, this view which considers culture as

an agreed-upon system of ideas that exist independently of the subject, as Durkheim's vision suggests, had the same definition of the state that Thomas Hobbes had proposed in 1651. To Hobbes, it was necessary that society would follow the path of progress, and in order for that to happen, he thought that there had to be a secular God, as a Leviathan, that brought together a series of agreements which, in turn, would enable the flow of all processes and mechanisms of a society which was, at that moment, beginning to globalize capitalism. Hobbes supposed that a society without a state, that is, an institution in charge of enforcing the series of agreements intended to safeguard individual autonomy, was in a "state of nature," which was worse since it was not possible that any institution would guarantee any kind of right. With this vision, Hobbes described a dichotomy which had been being woven throughout several centuries when nature was thought to be at one side and culture on another. Hence, Hobbes established an idea which is almost natural today, that society needs the state to go out from nature that is a place reserved only to savages (de la Cadena 2010).

From the moment the notion of culture emerged as a subsidiary concept stemming from the broader ideologies legitimating modernity (as the only way of possible social and cultural organization), such a notion of culture has been falling into disuse because when it is staged, as a category of analysis, it naturalizes the state. Culture is not necessarily a way of adapting to an environment where the political conflict harassing most of the tribal nations is absent. Neither is it a script that is designed and redesigned in a political vacuum. In current debates, it is more important to consider culture as the device that, for example, enables, locally, the detection of global practices (Gibson-Graham 1996), the resistance of social insertion, or the denunciation of collective rights violations. In the case of Latin America, archaeology, hand in hand with ethnic social movements, has given a way to question how the state and church banned and made local practices invisible (Gnecco and Hernández 2008). In this sense, archaeology has been a tool, among multiple tools, to the epistemological decolonization process (Haber et al. 2010).

Future Directions

Nowadays, there is a movement within social sciences that disposes of Durkheim's inherited view regarding what should be the object of investigation. For this reason, there is an increasing tendency to critique and dispose of the view of culture as a normative device which imposes itself on subjects. As Bruno Latour suggests (Latour 2008), nowadays, it is not about investigating social phenomena, but investigating how the social is a product of a series of associations taking place between human and nonhuman subjects. This discussion regarding the participation of nonhumans in the conformation of the social has returned the view to phenomena such as in animism, which were gradually ignored in anthropological investigation (Haber 2009).

Considering the nonhuman aspects of this discussion, it is possible to include the landscape. There exists an increasing tendency to understand the landscape as a subject that participates in the human symbolic constructions. This approach, known as the "phenomenological view," has interesting connection with another tendency exploring how, in social analysis, humans not only generate representations but also build a world to inhabit (Ingold 2000). With this approach, the Western Cartesian idea "I think, therefore I am" has even been questioned, with the surrounding world increasingly construed within the terms of "inhabiting." Considering landscape and nonhuman actors, the sentence "I think, therefore I am" could be changed into "I inhabit, therefore I am." As can be noted in this reflection, it is more productive not to consider thinking as something completely abstract, but as something that requires being in a specific place in a series of concrete relationships with human and nonhuman actors. Undoubtedly, this is the direction in which the theoretical discussion will be orientated in archaeology in the following decades.

As with the previous concepts, given the increasing generation of local autonomies, especially in communities subordinated in the past, the notions of culture used in archaeology will have to take into account the decolonization project. This

is happening around different parts of the world (Gnecco and Hernández 2008). Due to this tendency, it is most likely that archaeology will take alternate routes that will carry it away from being a science that only studies past behavior.

Cuneiform and Cuneiform Artifacts

Laura Culbertson
American Public University, Cincinnati, OH, USA

Introduction

Cuneiform is a writing system of the ancient Near East expressed by impressing signs into wet clay tablets, of which approximately 600,000 are

known. It could also be inscribed or stamped on to other types of media: seals made of precious stones, monumental stones, bricks, clay prisms, and wall reliefs in monumental architecture. Objects inscribed with cuneiform records are studied as texts (i.e., for philological, linguistic, or historical information), but can also be studied as archaeological artifacts. Unfortunately most tablets were not found in situ but acquired through illicit digging.

Definition

Cuneiform refers to a writing system used to express a variety of ancient Near Eastern languages. The word means "wedge shaped" and refers to signs including pictographs, syllables, and semantic indicators. Use of the writing system in the Near East spanned more than three millennia, with the invention occurring in the last centuries of the fourth millennium BCE in southern Mesopotamia and the last attestation dating to the first century CE. Over this span, scribes adapted the writing system for different languages, administrative needs, or local traditions. The earliest cuneiform signs are curvilinear and pictographic, but signs gradually became more abstract. The earliest versions of cuneiform pictograms conveyed little phonological or grammatical information.

The writing system was expanded and adapted over millennia to accommodate Sumerian, Akkadian (including Babylonian and Assyrian dialects), Elamite, Hittite, Luwian, Hurrian, and a variety of other dialects such as Eblaite and West Peripheral Akkadian. Bilingual texts are also written using cuneiform, and these have aided in the decipherment of many of these dead languages. Also, cuneiform was used to express languages after they were no longer spoken, preserving dead languages and archaic scribal conventions for archival or liturgical conventions. Sumerian is the prime example of this.

The expansion of cuneiform also corresponded to developments in how writing was used in the society and government. The earliest cuneiform records from the city of Uruk in southern Mesopotamia indicate the system was developed as a byproduct of urban economy and administration; the earliest texts keep accounts and record economic transactions. This contrasts with ancient Egypt or China, where writing was invented to serve more explicitly ideological and religious purposes. Even though the majority of cuneiform tablets from the ensuing millennia are also concerned with economic and administrative information, the uses of writing expanded to other genres: literature, letters, law, magic and medicine, religious works such as hymns, monumental and royal inscriptions for kings and gods, and even school texts pertaining to the study of cuneiform and cuneiform textual traditions (Van De Mieroop 1999). Because the media of cuneiform is baked clay or stone, many inscribed objects survived political upheavals even if destruction occurred as well. Scribes throughout ancient Near Eastern history could actively engage in the compilation and study of older written traditions and works.

Key Issues

Since the first decipherments of cuneiform in the mid-nineteenth century by George Grotefend and Henry Rawlinson, much scholarly energy has been devoted to philology and reading inscribed objects as texts, but scholars have also recognized the value of studying these objects as artifacts with a context, provenience, and social and material life. The materiality of cuneiform documents receives increasing treatment (Delnero and Lauinger 2015). Technology-aided initiatives now enable study of both aspects of cuneiform records.

Events in both modern and ancient history complicated efforts to determine the context and lives of cuneiform records, particularly tablets, seals, and seal impressions, and objects inscribed to serve as building dedications. It is understood that most tablets from the Near East were at some time organized either in state or "public" archives (within temple or palace institutions) or private archives (in households of entrepreneurs, local leaders, or families with important stakes in urban political and economic life). At the time of recovery, tablets may have been located near an original archival context, or they may have been

discarded and separated into a secondary context as trash or as the result of historical circumstances such as a city destruction or regime change. Construction and renovation projects, integral to the performance of Near Eastern kingship, also disrupted temple and palace archives, displacing inscribed objects of earlier generations.

In more recent history, information about archaeological context was lost during excavation and looting and the consequences of two World Wars interrupting excavations and the transport of finds. Many of the recovered cuneiform artifacts are housed in European and North American museums and university collections. Of the catalogued cuneiform documents in these collections, tablets were recovered by excavations during the nineteenth and early twentieth centuries or purchased in bulk from looters. During this time, texts were often viewed as non-archaeological material and removed without attention to context or record of find spot. The era of Western imperialism following the collapse of the Ottoman Empire and World War I witnessed more formal excavations and expeditions under the auspices of Western universities and societies and the introduction of new methods of expertise. However, sloppy extraction and sale of tablets and inscribed objects continued. After the US-led invasion of Iraq in 2003, a new phase of looting and illegal distribution of cuneiform texts resulted in the proliferation of more documents, many finding their way into Western collections. Questions about the nature and legality of acquisition remain a source of intense controversy among scholars and government officials (Goode 2005).

Regardless of individual positions on the ethical debates about acquisitions, the complexities of tablet proveniences and archaeological contexts have prompted philologists, historians, and archaeologists of the Near East to develop innovative methods for reconstructing lost information. Because the cuneiform writing system evolved over time and entails numerous local traditions, philologists have been able to determine provenience using paleography and clues provided in date formulae, information in colophons, or other overt or implicit indicators about filing systems or purpose (Reade 1986). To understand the probable find spots of tablets excavated during the nineteenth and early twentieth centuries, archaeologists analyzed excavation reports, continually using new technologies such as GIS or digital reconstructions of buildings. Some archive contents have been reassembled without even knowing the location of the original archive (the Garshana and Irisagrig archives are two examples from the late third millennium BCE).

To postulate the original archival context of a tablet, scholars have also developed the concept of "artificial archives" of tablets using clues provided by these methods. Artificial archives may consist of tablets hypothetically comprising of one original archive that was dispersed in later ancient or modern historical circumstances, such as looting or excavations in the nineteenth century. Some methods of reconstructing archives also include integrating other types of inscribed items or bureaucracy technologies, such as seal impressions or seals that bear the names of officials cited in economic and administrative transactions.

Combined, these methods not only shed new light on individual tablets and how they were used but also on the general purpose of written records and record keeping in Near Eastern societies.

In the last two decades, a number of digital archives emerged to compile cuneiform artifacts, providing not only transcriptions of cuneiform texts but also high-quality images of the objects and databases of information pertaining to provenience and history of recovery. These aid in data mining and prosopography while accelerating the pace of published editions of texts. Additionally, digital archives include means for visualizing the artifacts, such as 3-D image capture. Cuneiform signs are lemmatized for searchability (Cohen et al. 2004). Examples of these databases are the Cuneiform Digital Library Initiative (CDLI), the Database of Neo-Sumerian Texts (BDTNS), and ARCHIBAB, a corpus of Old Babylonian texts, among others. The Open Richly Annotated Cuneiform Corpus (ORACC) assembles cuneiform sources and has numerous projects organized by topic. The multi-institutional collaboration of databases virtually reunites the cuneiform record into a globally accessible corpus of evidence from which scholars can reconstruct archives. These technologies also allow researchers to study individual objects and their inscriptions, identifying

signatures that place the objects in archival, temporal, and geographic contexts.

Cyber-archaeology

Thomas E. Levy and Brady Liss
University of California, San Diego, La Jolla, CA, USA

State of Knowledge

Introduction

As it currently stands, *cyber-archaeology* can essentially be divided into two schools of thought. *Cyber-archaeology* was first brought into the archaeological discourse following a meeting of the Theoretical Archaeology Group in 2009 which evaluated *cyber-archaeology* and its theoretical underpinning as a tool for archaeological research, culminating in several publications on the topic (Forte 2010, 2011 and citations there within) (*Cyber-archaeology* emerged in the 1990s in communications and anthropology to investigate virtual communities and online behavior ("the systematic exploration of cyberspace") – in other words, an "archaeology" of the cyber rather than the application of cyber-tools within archaeology (Jones 1997; Escobar et al. 1994).). Growing out of *virtual archaeology* (Forte and Siliotti 1997), this *cyber-archaeology* focused primarily on simulating "a potential past" in a 3-D "cyber-environment" (Forte 2011). In other words, *cyber-archaeology* "embodies multiple interpretations [of the archaeological record] through virtual simulations, embedding real-empirical and digital-virtual data" (Forte 2014). The second approach to *cyber-archaeology* adopted a broader definition, essentially synonymous with *digital archaeology*, in using "digital" and "cyber" tools (e.g., digital photography, laser scanning, remote sensing, virtual reality, etc.) to explore and investigate the archaeological record (Jones and Levy 2018; Averett et al. 2016; Kansa et al. 2011). Today, both forms of *cyber-archaeology* coexist with Maurizio Forte (2015) at the forefront of the interpretive model focusing on simulation and Thomas E. Levy (2017) adopting *cyber-archaeology* in the more general sense. This entry will focus on *cyber-archaeology* as defined by Levy (see below) and developed in practice at the University of California, San Diego (UCSD) (see References and Further Reading for additional sources concerning *cyber-archaeology* as developed by Forte).

Levy (2013, 2015) defines *cyber-archaeology* as the integration of the latest developments in computer science, engineering, the natural sciences, and archaeology. Furthermore, he identifies four main domains or phases of *cyber-archaeology* – data capture, data analysis, data curation, and data dissemination – representing the entire *cyber-archaeology* workflow for archaeological research/fieldwork (conceptualized as a pie diagram, Fig. 1) (Levy 2013). These four

Cyber-archaeology, Fig. 1 Model representing the cyber-archaeology workflow as developed by the University of California, San Diego (after Levy 2013)

phases are completed using entirely digital tools that are relatively seamlessly integrated to create a cyber-workflow (i.e., paperless) for recording archaeological and cultural heritage data. UCSD has been dedicated to developing this approach to *cyber-archaeology* through its "Training, Research, and Education in Engineering for Cultural Heritage Diagnostics" initiative beginning in 2010 (Levy 2017) and with partnering institutions as part of the "At-Risk Cultural Heritage and the Digital Humanities" Research Catalyst Grant awarded in 2016. This entry is organized into four sections representing each of the components of the *cyber-archaeology* workflow as envisioned by Levy. In addition, each section will include a discussion of the *cyber-archaeology* tools developed by UCSD specifically for each phase. Along with references to relevant case studies throughout, the entry concludes with a brief review of a representative example of *cyber-archaeology* based on recent work by UCSD and the University of the Aegean in Greece. In doing so, this entry provides an overview of the *cyber-archaeology* workflow for an archaeologist to use a basis for implementing *cyber-archaeology* on any project or field site.

Data Capture/Acquisition

Critical to *cyber-archaeology* is a fully digital, data capture system that accounts for the difficulties of a field setting0020 (such as limited access to the Internet or even electricity) and maximizes the amount of data that is brought back to the research institution (mitigating the issues of access to archaeological sites, artifacts, and data). At UCSD, *cyber-archaeology* combines off-the-shelf technologies with custom computer programs/hardware developed specifically for

collecting archaeological/cultural heritage data in a digital format in the field (Levy et al. 2010). On an archaeological excavation, both artifacts and loci (discrete and three-dimensional excavation units or contexts) require precise recording of their geospatial location (X, Y, and Z coordinates) along with data and metadata such as number identifiers, types, classifications, descriptions, etc. (Smith and Levy 2014). *ArchField* – a custom software developed by Neil Smith for this purpose – combines real-time, 3-D recording of geospatial data with data entry forms for relevant archaeological data (Smith and Levy 2012). To do so, *ArchField* integrates digital surveying equipment (a Total Station or GPS unit) with digital data entry (a laptop computer or tablet device) to streamline recording artifact and loci locations in 3-D space (Smith and Levy 2012, 2014). The Total Station is simply connected to a laptop or tablet running *ArchField* through its serial cable; the coordinates of points collected by the Total Station are immediately captured by *ArchField* where any additional information is added by the archaeologist. Thus, *ArchField* can handle collecting the main elements of archaeological data in the field through a single digital platform. All data is stored in an Apache CouchDB (open-source software) database which is also run on the computer, allowing for offline storage – critical for most field applications (see Smith and Levy (2012) and Levy et al. (2014) for a case study of *ArchField* on excavations in Jordan).

The *cyber-archaeology* workflow also requires a digital method for recording the more detailed contextual information associated with loci (e.g., sediment descriptions, periodization, construction styles, stratigraphic relationships, etc.), in other words, digital locus sheets (Levy et al. 2012). *OpenDig*, a custom software developed by Matthew Vincent, is a mobile application for recording excavation data associated with loci (Vincent et al. 2014a; Levy et al. 2012). It was designed for iOS devices which are both affordable and portable. By using these handheld devices, digital notes can be recorded in the field during the excavation process. In this way, *OpenDig* replaces paper recording and alleviates potential issues with handwritten notes such as illegible writing or inconsistent terminology used across field directors and supervisors. Instead, *OpenDig* utilizes a series of drop-down menus with pre-set descriptions and terminology for rapid and consistent recording. These menus and the set of available descriptions/terms are customizable to the specific field project. Furthermore, *OpenDig* eliminates the need for digitization of paper documents at the end of the field day or season, a common step on excavations still using paper-based recording strategies. Similar to *ArchField*, *OpenDig* uses a CouchDB database that is backed up to a locally hosted field server. This step also allows for synchronization across devices (as each square/area supervisor will have a personal device for recording their own excavations), provides a central location where all data is stored, and enables data review and editing while in the field (Vincent et al. 2014a). Together, *OpenDig* and *ArchField* create a unified digital recording system for all the archaeological and excavation data collected in the field (see Vincent et al. (2014b) for additional discussion of the integration between *ArchField* and *OpenDig* and Levy et al. (2010, 2014) for its application on excavations in Jordan).

Along with using advanced technologies for field recording, capturing/documenting archaeological sites and excavations using 3-D methodologies is becoming a common practice on twenty-first-century excavations/surveys, and this is an integral component of *cyber-archaeology* (e.g., De Reu et al. 2013, 2014; Howland 2017; Howland et al. 2015). With reduced equipment costs and easy-to-use/affordable computer software packages for producing image-based 3-D data, the modern archaeologist can easily create 3-D models in the field using a digital camera and a laptop computer. A common method of 3-D modeling (and the primary method used at UCSD) is Structure from Motion (SfM) (Howland et al. 2014). SfM is a computational technique for producing a 3-D structure or model from a collection of 2-D images. Using overlapping digital photographs encompassing an object or area of interest, ranging from an individual artifact to an entire site, SfM is able to match similar points between images and create depth

from their different perspectives. As such, SfM can produce a 3-D model from just a collection of digital photographs. After taking the necessary photographs, models can be processed using commercially available software packages like Agisoft PhotoScan/Metashape (there are also other options available such as Bentley ContextCapture). Agisoft is widely used by archaeologists to generate 3-D models from SfM because of its intuitive interface and georeferencing functionality; along with 3-D models, Agisoft can produce georeferenced, high-resolution orthophotos (a photograph with a top-down perspective corrected for distortion to display the true ground position of features and to have a uniform scale for accurate measurements) which provide an ideal basis for GIS-based digitization and mapping of site features. As such, the 3-D models produced by SfM are a valuable dataset in their own sense (for documentation, preservation, and outreach), but they can also improve the accuracy and efficiency of site mapping (see Howland et al. (2015) for a case study).

Moreover, SfM can produce models on any scale when provided with the necessary imagery and computing power. To maximize this potential, archaeologists can employ both aerial and terrestrial photography strategies. Helium balloons and drones (UAVs) are common data capture tools used by archaeologists for photography, mapping, and 3-D model-building on the largest scales including the entire site or excavation area. A helium balloon system has proved most useful for the UCSD workflow to capture low-altitude aerial photography (LAAP) for site modeling and mapping (Howland et al. 2015). The current LAAP platform includes a Kingfisher™ Aerostat K9U helium balloon with a camera frame. Attached to the frame is a Canon EOS 50D DSLR equipped with an 18 mm lens positioned directly downward for high-resolution, vertical shots. The balloon is tethered to a reel carried by an operator who controls the direction of the balloon to fly transects over the site and the altitude which varies based on the specific context to capture overlapping photographs for SfM. Photographs are automatically taken at regular time intervals by an intervalometer controller; time between images is similarly determined based on the size of the site/area being photographed. Drones are an alternative to balloons, and they are gaining in popularity among archaeologists (Smith et al. 2014a). In particular, affordable, off-the-shelf drones built by companies such as DJI have made drones much more accessible to archaeological projects; DJI's out-of-the-box Phantom 3 Standard Quadcopter Drone can be purchased for less than $800. The drone is also easy to fly with an automated flight system and includes a video/12-megapixel camera, a gimbal to stabilize the camera, a live video feed, and a 25-minute single charge for the battery. The downside of drones is that they are delicate and have limited flying time, before the batteries need to be recharged. While balloons require expensive helium, for excavations that last longer than a few weeks, they are great for day-to-day recording, needing only occasional top-ups of helium. Thus the particular aerial platform used should be determined based on the specific project (size of site, length of project, budget, etc.). Whether using balloons or drones (or other platforms, see Howland 2017), aerial photography for 3-D modeling has become common data capture tool in *cyber-archaeology*.

A terrestrial approach to SfM is essentially identical to the aerial method described above: collecting overlapping photographs with complete coverage of a desired target intended to be modeled in 3-D. In this case, images are simply captured from the ground manually; however, rather than transects, overlapping images with complete coverage are captured by circling the entire area/artifact from varying heights if needed. Terrestrial methods are typically used to produce models of individual artifacts, loci, and excavation units/features. For excavation units, the results can also be georeferenced for digitizing top plans and GIS analysis. Using SfM for top plan generation is beneficial in removing some of the possible error in hand measuring and drawing (Olson et al. 2013). Together, a combined aerial and terrestrial SfM capture strategy creates 3-D models on various scales during the course of

excavation, providing and preserving an exceptional digital record of all field work.

In addition to SfM models, a "CAVEcam" system is also used to capture 3-D imagery of an excavation area/site (CAVE stands for Cave Automated Virtual Environment, discussed further below in the "Data Dissemination" section). The CAVEcam is a digital camera platform developed for shooting stereo photography in 360 degrees intended for visualization in a CAVE environment. To do so, it combines a GigaPan EPIC Pro Robotic Controller with a dual-camera image capture system (Ainsworth 2012). The robotic controller is a camera mount which automatically and accurately positions a camera (in this case, two cameras) to capture slightly overlapping photographs in a grid which can be stitched to create GigaPan images, panoramic photographs with over a billion pixels. The dual-camera system includes two Panasonic Lumix GF-1 cameras which provide 12.1 megapixel resolution while still being relatively small for mounting side by side in the controller (Ainsworth 2012). By bracketing two cameras next to each other, they collect two sets of images with slightly differing perspectives to provide stereoscopic vision (much like human eyes). The robotic mount is outfitted with an Ainsworth CC-1 Dual-Camera Controller to automatically capture images from both cameras simultaneously from each position, automating the entire capture process. The CAVEcam creates two 6x12 grids of photographs (one from each camera) from distinct perspectives. And these grids are individually stitched using the PTGui Pro software and displayed to create a single, high-resolution 3-D image in 360 degrees. When viewed on a 3-D visualization platform, this encompassing perspective allows the user to "look" around the photographed environment, which along with the depth created through stereoscopy can provide the realistic effect of standing at the original location. However, recording archaeological sites in 3-D, especially using multiple methodologies, along with the excavation data recorded using *ArchField* and *OpenDig*, creates massive digital datasets that require special consideration for curation, storage, and dissemination.

Data Curation and Storage

As seen above, the transition to a *cyber-archaeology* introduces new questions and potential problems for data storage, curation, and dissemination based on the size (in terms of computer memory) of produced datasets – the "data avalanche" (Levy et al. 2010). With these challenges in mind, UCSD developed software for managing archaeological data in the field and partnered with the UCSD Library for final storage and long-term curation of digital archaeological and cultural heritage data. Following the collection of field data using *ArchField,* this data is synced to a local server in a field lab providing data redundancy, and the artifact and loci information is integrated into *ArchaeoSTOR. ArchaeoSTOR* is a web-based application (also developed at UCSD by Aaron Gidding) and database designed specifically for digital storage, management, and curation of archaeological data (Gidding et al. 2013, 2014; Smith et al. 2017). As a database, *ArchaeoSTOR* allows for text-based artifact data/metadata and geographic information into digital forms which can be associated with photographs and point cloud data. Created data is stored on a local server using a CouchDB database software which allows data to be quickly retrieved, organized, and managed through *ArchaeoSTOR's* sorting and searching functions. *ArchaeoSTOR* has the capability to function as a stand-alone server as well as hosting in the home lab, making it a versatile tool for recording data in the field and data storage/analysis in the research institution. *ArchaeoSTOR* is deployed using a localized network and field server housed in an on-site lab, and users simply access the platform through personal laptops (connected to the local network). This server also hosts the *ArchField* data, providing straightforward integration between the two applications (Smith et al. 2017). Once back from the field, the collected data can be easily moved to more permanent storage (see below). All data remains accessible through the *ArchaeoSTOR* webpage for continued post-excavation management and analysis.

ArchaeoSTOR was specifically developed to facilitate the transfer of archaeological data to the university library as the final storage facility;

all data can be exported as spreadsheet file (the format required for integration into the library) with a functionality built directly into the program. The library is the ideal repository for the "data avalanche" produced by *cyber-archaeology* recording methods because it provides both long-term digital data curation/preservation and widespread data dissemination through accessible digital (web-based) and physical (publications and 3-D visualization environments) means ("Data Dissemination" is further discussed in the relevant section below). The UCSD Library has developed a curated digital storage system, the UCSD Library Digital Asset Management System (DAMS), for storing, searching, and retrieving digital files and their associated metadata. The DAMS affords researchers with a large-scale data repository for perpetual storage and conservation by library curation staff. All content within the DAMS is also replicated and geographically distributed across a preservation system, the Chronopolis digital preservation network (Yoo et al. 2017). Chronopolis currently includes hundreds of terabytes of storage and four geographically disparate nodes for data redundancy and disaster protection. Integrating archaeological data into the DAMS therefore provides multiple levels of data storage and protection.

All 3-D data, including CAVEcam imagery and SfM models, are similarly stored on the UCSD Library servers; however, this data is first organized, curated, and stored on a locally developed database called CAVEbase (McFarland et al. 2017). CAVEbase, created by Chris McFarland at UCSD in collaboration with the Center for Cyber-Archaeology and Sustainability and the Cultural Heritage Engineering Initiative, was designed to address the data management and sharing challenges associated with producing big data such as large-scale 3-D files and datasets. CAVEbase currently provides storage and visualization for images, videos, and 3-D models through a web-based platform. By accepting various 2-D and 3-D file types, CAVEbase can store both raw and processed data associated with 3-D models. Data is uploaded to CAVEbase through its custom webpage which accommodates typical data and metadata fields associated with 3-D files/models such as descriptions, locations, instruments used, level of processing, and copyright information (McFarland et al. 2017). The uploaded data is stored on a local server, and it is immediately copied to a second high-capacity server for data redundancy and protection. Data on CAVEbase is also getting integrated into the UCSD Library DAMS for long-term data storage and protection. For visualization, a subset of the 3-D data is made available via a Network File System to 3-D visualization environments for exploration and outreach (see "Data Dissemination" section).

Data Analysis

A major benefit of *cyber-archaeology* and collecting archaeological data in a digital format is that it is readily available for analysis. Data analysis within *cyber-archaeology* can take a variety of forms and emphasizes using digital data and tools to support our understandings and interpretations of the archaeological record. For example, at UCSD, data analysis includes 3-D modeling for artifact analysis and crowdsourcing of satellite imagery (Levy et al. 2012, 2014; Smith et al. 2014b; Savage et al. 2017). As described above, terrestrial SfM techniques (and also 3-D scanners such as the NextEngine Scanner) can be used to produce 3-D models at the artifact scale in the field or lab. The UCSD *cyber-archaeology* workflow has found this to be particularly useful for pottery analysis (Levy et al. 2014; Smith et al. 2014b). Using a 3-D scanner or SfM to model ceramic sherds can expedite and increase the accuracy of ceramic drawings usually completed by hand. To facilitate analysis of these sherds, UCSD, the Weizmann Institute of Science, and the Hebrew University of Jerusalem collaborated in developing the Pottery Informatics Query Database (PIQD) (Smith et al. 2014b). The PIQD is an online tool that allows for the upload and storage of 3-D models and profiles of ceramic sherds. Moreover, the database is queryable, allowing for archaeologists to search for parallels and objective classifications of pottery sherds to look for patterns of historical and anthropological significance (Smith et al. 2014b). The PIQD works in tandem with Pottery3D (developed by A. Karasik) which allows for the automatic

generation of 2-D profiles of ceramic sherds from the 3-D models which are suitable for upload to the PIQD or publication (Smith et al. 2014b: Fig. 5). As such, a workflow of producing a 3-D model of a sherd, generating a profile with Pottery3D, and uploading to the PIQD creates a fully digital record of the sherd. In doing so, it provides a digital methodology for constructing ceramic typologies, comparisons, and statistical analysis through the web. Currently, the PIQD has over 10,000 data entries with approximately 3000 of these sherds converted to the required format for mathematical queries and readily available for archaeologists through its online platform (see Smith et al. (2014b) for a case study from the Southern Levant).

Satellite imagery is also playing an increasing role in archaeology and *cyber-archaeology* (Parcak 2019), but analyzing these datasets, which often cover substantial geographical scales, can be time-consuming. To facilitate analysis, *cyber-archaeology* at UCSD has embraced crowdsourcing (Savage et al. 2017; Lin et al. 2014). Crowdsourcing uses the voluntary assistance of a large group from the general public to conduct research (Savage et al. 2017). By leveraging the work of hundreds to even thousands of volunteers, crowdsourcing makes analysis of large-scale satellite imagery feasible by alleviating constraints of time and money. One example of combining satellite imagery analysis with crowdsourcing for archaeological research developed at UCSD is the TerraWatchers platform (Savage et al. 2017). TerraWatchers is a web-based application built on the Google Maps API to provide satellite imagery for crowdsourcing of at-risk world heritage. Registered users of TerraWatchers are provided with satellite imagery of known archaeological sites to look for evidence of looting or other visible damage (Savage et al. 2017). The users can then "tag" what they see using pre-set descriptors such as "looting" or "impact crater" in conflict zones (Savage et al. 2017). The archaeologist can then aggregate this data to inform their understanding of at-risk archaeological sites. By crowdsourcing, TerraWatchers has collected data on 2551 archaeological sites with thousands of observations of damage in some form (Savage et al. 2017). TerraWatchers has partnered with the American Schools of Oriental Research Cultural Heritage Initiative to use the produced data to monitor at-risk sites, to inform preservation and mitigation projects, and for international outreach.

For additional case studies of using *cyber-archaeology* for data analysis, see Lercari 2019 (using terrestrial laser scanning to monitor earthen architecture), Levy et al. 2008 (a combination of terrestrial laser scanning, 3-D visualization, and radiocarbon dating for understanding the archaeological record), von Schwerin et al. 2016 (for collecting and processing LiDAR data), and Opitz and Limp 2015 and Optiz and Herrmann 2018 (for a general discussion of 3-D and spatial technologies such as laser scanning, remote sensing, and photogrammetry in archaeology).

Data Dissemination

Data storage and dissemination are intimately linked in the *cyber-archaeology* workflow. The UCSD Library serves the dual function of the final repository of all collected data and also a primary outlet by which this data is shared with both scholars and the general public. Data in the UCSD Library DAMS is accessible from the UCSD Library Digital Collections (DC) website (https://library.ucsd.edu/dc) to facilitate teaching, learning, and research. Once data is published in the DC, it is freely accessible to the public at-large and is indexed by major search engines and several data search portals (e.g., the DC and its datasets are discoverable through a simple Google search). As such, the UCSD Library also provides online data discovery/sharing of digital archaeological data. CAVEbase similarly allows for both 3-D data storage and sharing. The CAVEbase website is currently only accessible with permission due to data copyright and ownership; however, with appropriate authorizations, users can access a complete collection of 3-D models and CAVEcam imagery collected by UCSD teams. Critically, making all of this data available through the web facilitates sharing between all the stakeholders involved in an archaeological project. For example, joint projects, which are frequent in archaeology, can easily share data

between institutions (see the case study below based on a joint excavation by UCSD and the University of the Aegean).

Cyber-archaeology is also dedicated to using state-of-the-art visualization environments for sharing 3-D data. To this end, UCSD (and the partnering institutions of the UC Catalyst grant) constructed a CAVEkiosk in a location that would be accessible to the public (e.g., a university library or museum). CAVE environments, using technology pioneered by Thomas DeFanti of UCSD, are platforms for immersive, virtual reality visualization of 3-D data (Knabb et al. 2014). CAVEs are built by mounting multiple 3-D compatible screens on a frame and integrating their displays to present a single 3-D dataset on a large scale, thereby creating an immersive experience. In this way, CAVEs provide an ideal device for visualizing 3-D models or CAVEcam imagery of archaeological/cultural heritage sites. The CAVEkiosk model combines six 3-D televisions mounted on their side in a semicylinder formation. When the viewer is standing in front of the CAVEkiosk, it provides the sensation of being surrounded. The entire system is run through a single desktop computer using the Unity game development software for handling 3-D data. Moreover, the CAVEkiosk can access CAVEbase and its remote storage over high-bandwidth networks, allowing 3-D data stored on CAVEbase to be viewed at fully interactive rates. The Catalyst Project has successfully shared and visualized data from CAVEbase on CAVEs at the other UC campuses through the Pacific Research Platform (PRP), a high-speed data-sharing network connecting all ten UC campuses and other universities. The combination of CAVEbase, CAVEkiosks, and the PRP allow unprecedented sharing of 3-D data with scholars, students, and the general public.

A Case Study: At-Risk Cultural Heritage and the Digital Humanities in Greece

In order to field-test this approach to *cyber-archaeology*, a team from UCSD deployed the above-described methods at a joint University of the Aegean-UCSD excavation at Kastrouli, Greece, in 2016 as part of the At-Risk Cultural Heritage and the Digital Humanities Catalyst Project (for an additional *cyber-archaeology* case study in Jordan, see Levy et al. (2010, 2014)). Kastrouli is a small fortified site located on a rocky hill about 11 kilometers southeast of Delphi (Sideris et al. 2017). It was the focus of a small archaeological project in 2005 which included some excavation (primarily cleaning) to evaluate the condition of exposed tombs at the site (Raptopoulos 2012). Based on their disturbed nature, the excavations determined that the tombs were previously looted, and this understanding was reiterated by local shepherds who affirmed the tombs were looted over the past 50 years (Raptopoulos 2012; Sideris et al. 2017). The 2016 project aimed to fully excavate and document this tomb and survey the site more generally with 3-D methodologies. The area immediately to the east of the tomb was also excavated, and the defensive wall surrounding the site was probed in two locations (for a full discussion of the results and finds from the excavation, see Levy et al. (2017a) and Sideris et al. (2017)). Using a *cyber-archaeology* methodology was particularly important as Kastrouli was looted as recently as the early 2000s (Sideris et al. 2017) and is at risk for future theft/damage.

Excavation, Context, and Artifact Recording

The excavation at Kastrouli including all artifact and context data across all areas/units was recorded in an entirely digital format using a combination of *ArchField* and *ArchaeoSTOR* (*OpenDig* was not used on this particular project. A Microsoft Access database was used to digitally record locus information.). For this project, *ArchField* was installed on a Microsoft Surface for a balance of computing power and portability. Using ground control points established at the beginning of the excavation, each day in the field began by setting up a Leica TS02 Total Station close to the tomb excavation and connecting it directly (by serial cable) to the computer with *ArchField* (Levy et al. 2017a). *ArchField* and the Total Station successfully recorded all of the geospatial information associated with the loci and artifacts during the extent of the excavation. *ArchField*'s interface affording

rapid data entry also made handling and recording different artifact types quick and easy. Moreover, the real-time visualization and local storage of *ArchField* data proved a valuable capability for editing data immediately following any mistakes such as a bow-tied locus perimeter or a mislabeled artifact; an incorrect locus or artifact point could be immediately deleted from the local database and recorded again correctly. At the end of each day, the Microsoft Surface was brought to the field lab (located in the small village of Desfina near Kastrouli), and the *ArchField* data was synced with the local server hosted on a Mac Mini. The geospatial data was also exported as shapefiles each day, a functionality built into *ArchField*, to keep a record of each excavation day and for further analysis within GIS.

Once transferred to the field server, the *ArchField* data was integrated into *ArchaeoSTOR*. A unique entry for each recorded artifact and locus from Kastrouli along with its coordinates was generated within *ArchaeoSTOR* by extracting the data from the shared lab server. Each day's collection of artifacts were also processed in the field lab (such as photography, weighing, and measuring), and this information was added to the appropriate record within *ArchaeoSTOR*. The large number of excavated bones was not anticipated prior to fieldwork (under the expectation the tomb was entirely looted/disturbed), so *ArchaeoSTOR* was not initially prepared to handle osteological data; however, because *ArchaeoSTOR* is entirely run on-site, it was possible to add the appropriate data fields in real time. Following processing, artifacts were bagged and assigned to specific crates which were also documented in *ArchaeoSTOR* prior to final physical storage in the Delphi Museum. At the end of the excavation season, the Mac Mini field server was easily transported back to UCSD, allowing the archaeologists to return to the research institution with a complete record of all the archaeological data recorded. In addition, because the data exists in a digital format, it was easily shared with the University of the Aegean collaborators and replicated for protection against any potential data loss (discussed further below).

3-D Documentation: SfM and CAVEcam

Both the excavation areas and the site more generally were documented with 3-D photogrammetry to create a digital, photorealistic record of Kastrouli. A combined aerial and terrestrial approach was used to construct 3-D models on multiple scales. The LAAP helium balloon system was used for the aerial perspective of the entire site. In total, 6 balloon flights captured over 2000 photographs. An additional flight focused specifically on the excavation area around the tomb to provide a contextualized perspective in combination with terrestrial methods. The tomb excavation was photographed daily for SfM from the ground (sometimes more than once) over the course of the excavation. By the end of the season, over 2200 photographs were collected to produce 9 unique 3-D models of the tomb. The interior of the tomb was also photographed to model and document the architecture and to provide an internal perspective of the excavation (680 photographs). One of the wall excavation probes and the excavation extension to the east of the tomb were modeled once each (an additional 150 photographs). To date, these photographs have been used to produce 24 distinct 3-D models of the site and specific areas. This dataset including the photographs, edited photographs, and processed 3-D models comprises over 530 gigabytes of digital data. The CAVEcam was also used at Kastrouli to capture stereo-panoramic images throughout the site at seven locations of interest. All of the photographs and processed GigaPans (most of the image stitching was completed in the lab at UCSD after the expedition) comprise an additional 22 gigabytes of data. Total, these 3-D methodologies created a dataset of over 550 gigabytes (the "data avalanche").

Data Storage and Dissemination

After returning from the field, the final step was to deposit the collected archaeological and 3-D data at the UCSD Library for perpetual storage, curation, and dissemination (Yoo et al. 2017). All data captured in the field is first transferred to the UCSD Levantine and Cyber Archaeology Lab server for immediate replication and backup.

For transfer to the library, the artifact data and metadata collected from Kastrouli and stored in *ArchaeoSTOR* were exported as a spreadsheet and moved to the library staging server. The spreadsheet/data was then ingested using the library protocol (see Yoo et al. 2017), and a UCSD Library Digital Collection was created. Once the Kastrouli data was incorporated into the DC, it was replicated in Chronopolis providing long-term data preservation and protection. The final result is now available online and discoverable through major search engines providing exceptional access to all the excavation data (Levy et al. (2017b) which includes a link to the digital collection). All of the data is now readily available for any analyses by archaeologists and researchers.

The 3-D data including the CAVEcam images and 3-D models were processed while still in the Levantine and Cyber Archaeology Lab and also immediately backed up to local servers. The Levantine and Cyber Archaeology Lab has computers for processing high-resolution models with Agisoft and for stitching CAVEcam images using PTGui. From the lab, the models and stereoscopic panoramas were uploaded to the CAVEbase website along with all necessary data and metadata. Once in CAVEbase, everything was copied to the library servers for storage. As mentioned, CAVEbase access through a web browser currently requires permission; however, this 3-D data is still available for visualization by students and the public through the CAVEkiosk. The CAVEkiosk in the UCSD Library is open to visitors during regular library hours and can access data in the CAVEbase repository. Moreover, this data can be shared with CAVEkiosks at the other UC campuses over the PRP providing additional opportunities for outreach and dissemination. Finally, the results of this excavation have also been published in academic journals and book chapters, which are still considered a critical component of data dissemination even in *cyber-archaeology* (Levy et al. 2017a; Sideris et al. 2017).

Conclusion

As can be seen, *cyber-archaeology* is transforming archaeology through new data capture tools, curation methods, analyses, and dissemination. With the exponential increase in the global use of digital technologies, including cell phones and the Internet, it is essential that archaeology continues incorporating advanced technologies as integral components of our pedagogy, research, and outreach. The *cyber-archaeology* workflow as envisioned by Levy and UCSD provides an integrated and fully digital approach for dealing with these essential processes; critical to this workflow is the combination of off-the-shelf technologies (laptops, Total Stations, helium balloons/drones, digital cameras, etc.) with custom software/hardware (*ArchField*, *ArchaeoSTOR*, *OpenDig*, CAVEs, etc.). In this way, *cyber-archaeology* facilitates a seamless flow of digital archaeological and cultural heritage data from the moment it is collected in the field to final storage and curation in the university library. Moreover, the integration of web-based data sharing (CAVEbase and the UCSD Library Digital Collection) allows widespread data dissemination among project collaborators, stake holders, students/educators, and the general public. Sophisticated 3-D visualization environments, in particular the CAVEkiosk in the UCSD Library, also provide new and exciting methods for both education on campus and public engagement. In sum, while excavation still relies on the classic tools like trowels and buckets (for now), *cyber-archaeology* is moving archaeology forward into the Digital Age.

State of Knowledge and Current Debates

Introduction

Located in the northeastern Mediterranean Sea, the island of Cyprus has played an important, if often overlooked, role in the development and spread of cultural innovation in this region, serving as a major node of connectivity between the western and central Mediterranean and the Near East. Emphasizing the island's Prehistoric and Protohistoric periods, this entry outlines some of the significant social, political, economic, and ideological changes that took place on Cyprus from its earliest human occupation through to its incorporation into the Roman Empire. It addresses important debates, including the entanglement of the past in the politics of the present, as well as new discoveries and approaches that are changing the way we understand and interpret the Cypriot past. Cyprus serves as a compelling case study for those interested in a number of fundamental issues in archaeological research and practice, including connectivity and insularity, colonization and cultural encounters, human-environment dynamics, the origins of agriculture and development of complex societies, urbanization, identity formation, and colonial legacies. The discussion begins by briefly tracing the development of Cypriot archaeology from its antiquarian roots to a modern scientific discipline.

Archaeologies of Cyprus

The island's archaeology grew out of the explorations of various nineteenth-century antiquarians and early archaeologists who sought to unearth finds suitable for display in major European museums and private collections (see Tatton Brown 2001). The close proximity of Cyprus to the Levant and its (then) lack of obvious remains linking it to the Classical world placed it firmly in the "oriental" sphere with early scholars emphasizing its connections to Assyria and Phoenicia. Among the most (in)famous figures from this period was Luigi Palma di Cesnola, the United States consul to Cyprus (1865–1877) who recovered a large quantity of artifacts from the tombs and sanctuaries of several Iron Age sites. Although Cesnola's methods were questionable even by the standards of the day, his finds helped bring Cypriot antiquities to the attention of a wider scholarly audience and would eventually form the basis of the collections of the new Metropolitan Museum of Art in New York, where he served as the first director (for further reading see Karageorghis 2000: 3–15). Archaeological interest in Cyprus intensified following the transition from Ottoman to British control in 1878. The ensuing decades saw the beginnings of more methodologically rigorous investigations of the island's past with a focus on careful recording of stratigraphic sequences and the development of ceramic typologies. Interpretation was rooted in traditional art historical approaches concerned with the description of objects and their stylistic influences as well as the judgment of their aesthetic merits, by which Cypriot art was nearly always compared unfavorably with that of its Near Eastern and Greek contemporaries. The Swedish Cyprus Expedition (SCE) excavated a range of Neolithic through Roman sites between 1927 and 1931, marking the first effort to collect data systematically using then-current field methods in order to construct an island-wide

Cypriot culture history (Gjerstad et al. 1934, etc.). The SCE's work has been highly influential in framing discussion of the island's culture history and their ceramic-based chronology continues to form the basis of the traditional dating system (see below).

The influences of traditional art historical and culture historical perspectives continue to be felt in Cypriot archaeology even today and the anthropologically oriented approaches of "New" and, later, processual archaeologies were initially slow to gain acceptance. This began to change in the late 1970s through early 1990s with important new research supported by the application of scientific methods of analysis that focused on political economy and the development of social complexity and its links to ideology and power (e.g., Knapp and Cherry 1994; Manning 1993; Peltenburg 1993; Rupp 1988). The adoption of such approaches has meant that archaeological field work as currently practiced in Cyprus is, for the most part, problem-oriented and undertaken using current scientific methods. While field survey had been conducted by Hector Catling under the auspices of the Department of Antiquities since 1955, this period also saw the introduction of intensive regional surveys as a means of systematically investigating long-term changes to settlement patterns, demography, and land use (e.g., the Vasilikos Valley Project [Todd 2004]; see Iacovou ed. [2004]).

Postprocessual perspectives were also initially slow to penetrate into Cypriot archaeology but since the mid-1990s a number of scholars have adopted critical and postcolonial approaches, bringing not only a focus on issues of gender, agency, identity, and materiality (e.g., Bolger 2003; Fisher 2009; Knapp 2013) but also examination of the practice of Cypriot archaeology and its past and present engagement with politics (e.g., Bolger 2003: chap. 8; Knapp and Antoniadou 1998). In the field this resulted in the integration of landscape approaches with a focus on the social and symbolic dimensions of the physical environment, as seen in the influential Sydney Cyprus Survey Project (Given and Knapp 2003). Archaeological geophysics and other methods of remote sensing, scarcely mentioned in a 2004 review of field survey on Cyprus (Iacovou 2004), have become increasingly important as a means of mapping ancient urban landscapes and providing direction for excavation (e.g., The Kalavasos and Maroni Built Environments Project; see Manning et al. 2014; see also Sneddon 2015).

A number of organizations currently play a role in facilitating archaeological research on Cyprus. The Department of Antiquities is the government body responsible for the administration, protection, and promotion of cultural heritage on the island and as such it oversees all archaeological work, in addition to the Cyprus Museum (the national archaeological museum) in Nicosia, various regional and local museums, and monuments. It not only carries out its own vigorous program of excavation (including rescue work), conservation, and publication but has actively supported the many foreign expeditions that continue to work on the island. The Archaeological Research Unit of the University of Cyprus also plays a leading role in education, training, and archaeological research on various periods of the island's past. Since its founding in 1978, the Cyprus American Archaeological Research Institute (CAARI) has provided important logistical and technical support for archaeological research on Cyprus and the wider eastern Mediterranean. Its library is an important resource for research and CAARI supports dissemination through its program of lectures, symposia, and publication. The A.G. Leventis Foundation, established in 1979, has also played an important role in supporting the dissemination of Greek and Cypriot cultural heritage, particularly through its funding of archaeological publication and museum galleries around the world. The Nicosia-based Cyprus Institute hosts the Science and Technology in Archaeology Research Center (STARC), which has leading-edge fixed and mobile lab facilities and is devoted to the development and application of advanced science and technology in archaeology, cultural heritage, and history within and beyond Cyprus (see web resources below).

Physical Geography

One cannot begin an account of the Cypriot past without considering the island's physical geography. Settlement and movement within Cyprus and its connections with the mainland have always been influenced by its landscape, its surrounding sea and changing conceptions of insularity. It is the third largest island in the Mediterranean with an area of 9251 sq. km and is located nearly 70 km from the southern coast of Anatolia and just over 100 km from Syria (Fig. 1). Even at the last glacial maximum (c. 25,000–18,000 cal. BP), when sea levels were 130–120 m lower than today, Cyprus was still c. 40 km from the Levantine coast (Knapp 2013: 57). This barrier was sufficient to limit the sea-borne migration of terrestrial fauna to a few species, the largest of which were the pygmy hippopotamus and dwarf elephant. This would change significantly with the Holocene as various episodes of human visitation and colonization introduced a number of both wild and domesticated plant and animal species. Sea levels continued to rise during the Holocene (beginning ca. 11,500 cal. BP), sometimes quite rapidly, significantly altering the coastal landscape of Cyprus and inundating coastal plains throughout the Mediterranean.

Cyprus, Archaeology of, Fig. 1 Map of Cyprus showing locations of sites mentioned in text. Shaded area = land above 300 m (drawn by Kevin Fisher)

The island's most prominent landform is the Troodos massif in the southwest, a centralized mountain range rising as high as 1951 m asl (at Mt. Olympos). It consists mainly of igneous rocks surrounded by a ring of pillow lavas, which are significant as the source of sulfide ores, particularly the rich copper deposits for which Cyprus became famous beginning in the Bronze Age. The Kyrenia mountain range consists mainly of sedimentary rock and runs in a roughly east-west line following the island's north coast, forming a narrow coastal plain. Between the Troodos and the Kyrenia mountains lies the Mesaoria, a plain cut by a number of seasonal rivers that is currently used largely for grain production. According to Strabo (*Geography* 14.6.5), Eratosthenes remarked in his lost *Geographica* that the Mesaoria was thickly forested in antiquity but had been at least partially cleared by the third century BCE for shipbuilding, agriculture, and fuel for metal smelting. Coniferous forests continue to thrive today only in the upper reaches of the Troodos massif and the Akamas peninsula on the western coast, while much of the island's remaining vegetation presently consists of introduced maquis and garrigue.

Chronology

The traditional chronological sequence for Cyprus uses the Three Age system adapted from Greek archaeology and shares the culture-historical roots of such sequences in many regions of Europe and Asia. It therefore bears the weight of assumptions of cultural progress and the use of fairly arbitrary criteria to define periods, particularly ceramics. The notable lack of long cultural sequences from Cypriot settlements has meant that this chronology is based mainly on the seriation of ceramic assemblages from tombs along with their attendant assumptions regarding stylistic change and the issue of how representative such assemblages are of materials in daily use (Table 1). The chronology currently in use was institutionalized largely by the Swedish Cyprus Expedition, although it has become increasingly (perhaps unrealistically) complex with various

Cyprus, Archaeology of, Table 1 Chronology for ancient Cyprus (after Knapp 2013: table 2 and Papantoniou 2012: xxv)

Period	Phase/culture or alternative name	Dates (calibrated for prehistoric periods)
Late Epipaleolithic	Akrotiri phase	11,000–9000 BCE
Cypro-Pre-Pottery Neolithic A (PPNA)		9000–8500/8400 BCE
Cypro-PPNB	Early Aceramic Neolithic	8500/8400–7000/6800 BCE
Late Aceramic Neolithic	Khirokitia culture	7000/6800–5200 BCE
Ceramic Neolithic	Sotira culture	5200/5000–4500/4000 BCE
Early Chalcolithic	Erimi culture	4000/3900–3600/3400 BCE
Middle Chalcolithic		3600/3400–2700 BCE
Late Chalcolithic		2700–2500/2400 BCE
Philia Phase/Facies	Prehistoric Bronze Age 1	2400/2350–2250 BCE
Early Cypriot (EC) I-II		2250–2000 BCE
Early Cypriot III-Middle Cypriot (MC) I-II	Prehistoric Bronze Age 2	2000–1750/1700 BCE
Middle Cypriot III-Late Cypriot (LC) I	Protohistoric Bronze Age 1	1750/1700–1450 BCE
Late Cypriot IIA-IIC early	Protohistoric Bronze Age 2	1450–1300 BCE
Late Cypriot IIC late-IIIA	Protohistoric Bronze Age 3	1300–1125/1100 BCE
Protogeometric (Late Cypriot IIIB)	Early Iron Age	1125/1100–1050 BCE
Cypro-Geometric (CG)		1050–750 BCE
Cypro-Archaic (CA)		750–480 BCE
Cypro-Classical (CC)		480–310 BCE
Hellenistic		310–30 BCE
Roman		30 BCE–fourth century CE

ceramic-based phases and subphases (e.g., Late Cypriot IIIA:1b). An alternative chronology for the Bronze Age has been proposed based on a range of material indicators of sociopolitical change rather than ceramic sequences alone (see Knapp 2013: table 2), and is used here. The prehistoric end of the chronology has changed significantly in light of new discoveries and through high-precision dates obtained using Bayesian modeling to integrate radiocarbon dating and tree ring sequences (see Manning in Knapp 2013: 485–533). New terminology for the earliest periods recognizes the interconnections of Cyprus within its wider Near Eastern context.

Colonization and Early Prehistory

Recent discoveries have completely revolutionized what is known about the initial colonization of Cyprus and its earliest prehistory (see Knapp 2013: 43–119 for a detailed review). The site of Akrotiri-*Aetokremnos* (Cypriot sites are typically known by both the name of their municipality and an italicized local toponym) currently has the earliest securely dated remains of human presence on the island (Simmons 1999), although it is probable that the island was visited occasionally before that time by mainland fisher-foragers who left little trace of their presence. This 50 sq. m collapsed rock shelter, located on the Akrotiri peninsula of the island's south coast, produced four intact strata, two of which are of particular interest. Stratum 2 contained the vast majority of the cultural material including flake-based stone tools (mostly scrapers and burins) made from local chert, while Stratum 4, the earliest deposit, contained the majority of the faunal material, including two deposits of burnt pygmy hippopotami (*Phanourios minor*) bones, as well as a few chipped stone tools. Radiocarbon dating leaves little doubt of the site's eleventh through early tenth millennia cal. BCE occupation, but debate continues over the excavator's interpretation of *Aetokremnos* as a pygmy hippo processing site used by hunter-gatherers who eventually hunted the "mini-megafauna" to extinction, and some scholars question the association of the faunal and cultural material and the role of human agency in the Stratum 4 bone deposits.

For many years since its discovery *Aetokremnos* stood alone as the earliest site on the island. Recent work at both Nissi Beach (at Ayia Napa) and Akamas-*Aspros* has recovered sites located on fossilized sand dunes with flake-based lithic assemblages similar to that from *Aetokremnos* but not yet securely dated. Nevertheless, we might see these sites as locations of periodic, short-term visitation by fisher-foragers from the Levant, forced by the shrinking coastal plains and the cooler, more arid climate of the Younger Dryas event (10,800–9,600 BCE) to seek subsistence opportunities further afield (Knapp 2013: 51).

The lacuna that once existed between Akrotiri-*Aetokremnos* and the Late Aceramic Neolithic sites now dated to the seventh to eighth millennia cal. BCE, such as Khirokitia, is also vanishing in light of new discoveries. Excavations at Ayia Varvara-*Asprokremnos* have revealed the earliest Neolithic site on the island, dated to 9141–8569 cal. BCE, which places it within the date range of the late Pre-Pottery Neolithic A (PPNA) and early PPNB of the Levant (Manning et al. 2010). The site yielded evidence for blade-based lithic production as well as a possible semi-subterranean structure. Other significant finds include two groundstone shaft-straighteners of a type well known from the Natufian and Pre-Pottery Neolithic Levant, as well as a fragment of a baked clay figurine – the earliest representation of a human on Cyprus (Fig. 2). The recovered lithics, combined with a faunal assemblage dominated by wild pig, suggest subsistence based on hunting and foraging, rather than the nascent farming apparent elsewhere in the Near East during the PPNA (Manning et al. 2010).

These new discoveries place Cyprus within the mainstream of a wide-ranging Eastern Mediterranean-Near Eastern interaction sphere during the transition from the Epipaleolithic through Pre-Pottery Neolithic B (PPNB), and the island therefore takes on greater significance in discussions on the origins, timing, and directionality of early seafaring, colonization, and the spread of farming in the region. While some groups chose foraging lifeways that would continue on the coasts of Cyprus into the Cypro-

Cyprus, Archaeology of, Fig. 2 PPNA artifacts from Ayia Varvara-*Asprokremnos*; (left) baked clay human figurine fragment; (right) shaft-straightener fragment (courtesy of the Elaborating Early Neolithic Cyprus Project)

PPNB, other groups brought to the island a lifeway based on agropastoralism. These early farmers carried with them wild and (semi-?) domesticated plants and animals that served as the subsistence basis for the island's first permanent settlements during the Cypro-PPNB.

Excavations at sites such as Parekklisha-*Shillourokambos*, Kissonerga-*Mylouthkia*, and Kalavasos-*Tenta* (Periods 2–5), reveal early Cypro-PPNB architectural features carved into bedrock such as wells (some of which were reused for secondary burials), pits, and postholes and linear trenches that may have defined animal pens (e.g., Guilaine et al. 2011). These were later replaced by circular structures with stone foundations that may have been houses. Remains of domesticated wheat and barley, along with a lithic industry that included blades with gloss characteristic of use in harvesting grains, and groundstone querns and pounders, attest to the growing dietary importance of cereals. Faunal assemblages indicate the presence of several introduced species that were important for subsistence including fallow deer, as well as "pre-domestic" or managed caprids (sheep and goats) and cattle, and domesticated pigs. Thus, by the late ninth millennium cal. BCE, the island was inhabited by food producers – a surprisingly early date, which suggests that Cyprus was part of the initial developments in the origins and spread of resource production, rather than a late and peripheral participant. The motivations behind this initial colonization, though likely driven in part by the loss of coastal territories, might also be seen in social terms, perhaps prompted by a colonizing ethos or the desire of some

Cyprus, Archaeology of, Fig. 3 Photo of Kalavasos-*Tenta*, Late Aceramic Neolithic (courtesy of Ian Todd)

to turn their backs on the "Neolithic Revolution" (for further reading see Peltenburg and Wasse eds.).

The subsequent Late Aceramic Neolithic (LAN) witnessed the growing differentiation of Cypriot Neolithic groups from their mainland counterparts. The known sites share a common material culture, although it is unclear whether this signals the existence of a common group identity. Settlements were typically small villages (e.g., 1.5 ha for Khirokitia) founded on higher ground and both Khirokitia and Kalavasos-*Tenta* show evidence for outer settlement walls of stone or pisé (rammed earth) with stone facing (Fig. 3). Within were a number of closely packed circular structures, typically 2–5 m in diameter, with stone foundations and pisé or mudbrick superstructures. We know little about the social structure of these

villages. It is likely that a group of structures around an open space served as the residence of a single household. The construction of settlement walls suggests at least some suprahousehold coordination and singularly large and complex structures, such as the Structure 14 complex at *Tenta*, may have been a communal structure or perhaps the residence of a village leader, although there are no finds to indicate differential status for its occupants. These appear to have been largely egalitarian communities, and the evidence from burials, while indicating differential treatment based on gender, does not suggest overt displays of wealth. Individuals were often buried in a contracted position in pits below the floors of houses, although at *Tenta* a number were also interred in the rubbish that accumulated between buildings. Representational art consists mainly of figurines, carved of volcanic stone or modeled in clay, which show the human form with varying degrees of abstraction. The sex is usually ambiguous, although some appear phallic in nature (Steel 2004: 58–59). The general lack of overtly female imagery, the continued use of circular rather than rectilinear architecture, and the relative scarcity of obsidian (imported from Anatolia during the Cypro-PPNB) are among the many phenomena that point to the divergence of the LAN from its mainland roots and the island's growing insularity. This seems to have been a deliberate choice, perhaps in an effort to forge a distinct identity, as it is unlikely that the island's inhabitants were unable to retain contact with the mainland. This highlights, even at this early stage, the importance of insularity in the construction of identities on ancient Cyprus.

The island's inhabitants would continue along their own trajectory in the subsequent Ceramic Neolithic, although the apparent gap in the archaeological record between the end of the LAN and the Ceramic Neolithic (or Sotira Culture), while narrowed, has yet to be adequately explained (Steel 2004: 63–65). The most significant innovation is pottery, which appears fully developed, leading to suggestions by some scholars of a new colonization from the mainland. The recent illumination of other such "gaps" in the archaeological record, combined with continuities in elements of Cypriot Neolithic culture and significant differences from developments on the mainland, suggest at least some degree of local initiative. As seen at Sotira-*Teppes* and Ayios Epiktitos-*Vrysi*, settlement in small villages continued to be the norm, although houses were now usually subrectilinear in form. Peltenburg (1993: 10–12) has argued that *Vrysi* shows a division of the settlement into two social groups, based on the higher concentration of artifacts, evidence for ritual activity, and craft production in the older, northern part of the settlement. The burial record for this period is sparse but, in contrast, shows little evidence of social differentiation. The abandonment of the Late Neolithic sites and the transition to the Chalcolithic period that followed are poorly understood.

The Chalcolithic Period

New settlement patterns characterize the Early Chalcolithic, including the first known settlement of the southwestern part of the island, and sites with ephemeral timber architecture and pits of various sizes that might indicate communal storage. Other important innovations include the production of the first metal artifacts – tools hammered from native copper – and the growing importance of the production and consumption of artifacts made of picrolite, a light to olive green, soft stone originating on Mt. Olympos but found as river pebbles in the Kouris and Karyotis River beds.

Increases in both settlement and population numbers mark the Middle Chalcolithic, which is best known from the sites of Ermi-*Bamboula*, Lemba-*Lakkous*, and Kissonerga-*Mosphilia* in southwest Cyprus (e.g., Peltenburg et al. 1998). Some villages, such as *Mosphilia*, were quite large (c. 10 ha) suggesting the possibility of some form of site hierarchy. These villages consisted of an agglomerative arrangement of mainly circular structures, usually much larger than typical Neolithic buildings (up to 16 m in diameter), built with stone foundations and pisé or mudbrick superstructures. In the open spaces among these structures were numerous pits, some of which were used for burials, as well as storage and waste disposal. As during the LAN, a

cluster of structures might represent the living space of single household and Peltenburg has argued that some houses on the upper terrace at *Mosphilia* were arranged in pairs and associated with discrete burial groups that indicate the emergence of property rights (Peltenburg et al. 1998: 242–243). Larger buildings often have a raised central platform hearth and well-delineated activity areas for work, storage, and living/sleeping. In contrast to the Early Chalcolithic, production and storage appear take place at the household level, although a possible pendant workshop at *Mosphilia* suggests some degree of craft specialization (Peltenburg et al. 1998: 190–192).

The Middle Chalcolithic is remarkable for the elaboration of symbolic behavior. Much of this activity focused on symbolically-charged figurines and objects of personal adornment made from picrolite. While the finished products were likely locally made by nonspecialists, the distribution of picrolite in raw form appears to have been tightly controlled and linked to emerging inequalities on the island (Peltenburg 1993: 14). Human representation (usually female) took on many forms in stone and painted clay, with picrolite cruciform figurines being one of the hallmarks of the period (see Steel 2004: 99–103). They are often found as grave offerings but also appear in other contexts and many were undoubtedly worn on necklaces or otherwise used in daily practice and reproductive rituals. At *Mosphilia*, Peltenburg identified a ceremonial area with large, well-built versions of domestic structures that were set apart from the rest of the settlement and entered through a formal approach (Peltenburg 1993: 13–14). Ceremonial feasting events may have been staged in an adjoining open area, evinced by the nearby concentration of ovens and serving bowls. It was in this area that a spectacular deposit of birthing figurines and other ritual paraphernalia was found inside a Red-on-White ware ceramic house model (Fig. 4). Mortuary rituals also became more elaborate and differentiated during the Middle Chalcolithic. While children tended to be buried in pit graves outside of houses, adult burials now appear in the first known extramural cemeteries. The cemetery at Souskiou-*Vathyrkakas* consists of shaft graves and other funerary structures with evidence for multiple burials, both primary and secondary inhumations, and long-term reuse (see Bolger 2003: 153–158).

Both Lemba-*Lakkous* and Kissonerga-*Mosphilia* were abandoned at the end of the Middle Chalcolithic, only to be reoccupied after a hiatus of some two centuries. The Late Chalcolithic, however, brought a number of innovations as the relative insularity of the previous four millennia gave way to renewed contacts with the mainland. Cultural influences from southeast Anatolia included the appearance of more technologically advanced ceramics and new vessel forms. At the same time, changes in spatial organization, the decreasing use of figural art and the introduction of chamber tombs point to changes in social and ideological practices (Peltenburg et al. 1998: 70–72; Steel 2004: 107–108). The period also witnessed incipient attempts by some individuals and groups to accumulate power through control over productive labor. This is seen in the

Cyprus, Archaeology of, Fig. 4 Deposit of figurines and other ritual paraphernalia from Kissonerga-*Mosphilia*, Middle Chalcolithic; (left) in situ; (right) detail of ceramic building model (courtesy of the Lemba Archaeological Project)

Pithos House at *Mosphilia*, a large structure with evidence for the large-scale processing, storage, and possible redistribution of foodstuffs, perhaps including olive oil, and craft production in the form copper metallurgy and shell pendants (Peltenburg et al. 1998: 252–254). Peltenburg (1993) suggests that its (purposeful) destruction indicates that such attempts at aggrandizement and private accumulation of resources were actively resisted as part of a wider strategy of settlement discontinuity and fissioning that prevented the concentration of wealth and institutionalization of power. This would change dramatically over the course of the Bronze Age.

The Prehistoric Bronze Age

A suite of cultural innovations resulting from nascent international contacts, particularly with southern Anatolia, as well as more intensive exploitation of the island's mineral resources, and the localized emergence of pronounced social inequality, are among the interrelated developments that define the Prehistoric Bronze Age (PreBA). It begins with the short-lived and still poorly understood Philia phase (c. 2400/2350–2250 BCE), distinguished by a number of new cultural developments including Red Polished ceramics, mould-made copper artifacts, new architectural forms, and the reintroduction of cattle, which had disappeared from the faunal record by the Ceramic Neolithic (for detailed accounts of the PreBA see Knapp 2013: 278–280; Steel 2004: 119–148). While the Anatolian roots of these innovations are now unquestioned, there is debate among scholars regarding the degree to which these changes reflect local developments, spurred by emerging elites who were able to control both the internal distribution of prestige goods and long-distance exchange of copper with Anatolia (e.g., Manning 1993), or rather were the result of the arrival of Anatolian settlers (e.g., Webb and Frankel 1999). Knapp (2013: 130, 268–277) has recently explained EC culture as the product of the hybridization of native Cypriot and intrusive Anatolian cultural elements through the copresence of these groups during the Late Chalcolithic and Philia phase.

Certainly some of the most significant developments are associated with what has been termed the Secondary Products Revolution, which includes the use of animals (especially newly reintroduced cattle) for traction and products other than their meat. Use of the ox-drawn plough brought new areas under cultivation and underpinned a more efficient agropastoral system with surpluses that could be mobilized by emerging elites in strategies of wealth and status enhancement (Manning 1993). Combined with differential access to copper resources and metallurgical technology, these elites were able to take advantage of increased local and foreign demand for Cypriot copper, resulting in growing economic and social inequalities among households and extended family groups (Knapp 2013: 298–311), a process borne out in the EC cemeteries of Lapithos-*Vrysi tou Barba* and Bellepais-*Vounous* on the island's north coast. There, chamber tombs reused over generations exhibit evidence of elaborate burial rituals involving feasting, as well as large quantities of grave goods, particularly copper tools, weapons, and items of personal adornment, elaborate ceramic vessels with complex visual symbolism, and terracotta genre scenes either as separate models or displayed as scenes on the shoulders of vessels (Keswani 2004: chap. 4). Whether these tombs represent the emergence of hereditary elite lineages (Manning 1993) or more negotiable prestige distinctions, it seems that such pronounced inequalities were largely localized to the north coast. Nevertheless, funerary ritual at extramural cemeteries became the primary arena for intracommunity interaction and identity formation, as well as social competition and status display at this time (Keswani 2004: 37–83; Knapp 2013: 321). The establishment of corporate burial areas affirmed connections between the living, their ancestors and the land in which they were buried, and the territory to which the wider community laid claim in the context of growing land scarcity (Keswani 2004: 41).

The settlements associated with the *Vrysi tou Barba* and *Vounous* cemeteries have not been found, but the available evidence suggests that a relatively egalitarian social organization persisted elsewhere. The new agricultural practices

precipitated by the secondary products revolution brought other social changes, however, including a shift from communal and kin-based production to a household-based system with a more complex division of labor along gender lines (Bolger 2003: 38–41). This is reflected in new types of domestic architecture seen at sites such as Sotira-*Kaminoudhia*, Alambra-*Mouttes*, and Marki-*Alonia* – villages with rectilinear, multiroom dwellings arranged in accretive forms that were unplanned but required some level of cooperation among households. Marki, a 5–6 ha village at its largest extent, has the longest continuous habitation sequence (Philia through MC II), in which the typical rectilinear compound or house consisted of two or more covered rooms at the back of a larger courtyard, an idealized concept that remained in place throughout the life of the settlement (Frankel and Webb 2006: 311–318; Fig. 5). The segmentation and more specialized use of domestic space reflects the increasing task differentiation among household members during the PreBA. Community-level interactions and identities are also evident in the built environment of PreBA villages. Ceramic or stone anthropomorphic plank figurines found near entrances to communal activity areas at Politiko-*Troullia* and other sites may have played an important role in signaling suprahousehold identities in such contexts (Falconer et al. 2014). New survey and excavation work at Alambra-*Mouttes* reveals that the village consisted of several nodes of habitation, perhaps representing kin-based neighborhoods or specialized activity areas, separated by open spaces containing tombs, agricultural fields, and vacant land (Sneddon 2015). Several of these trends would greatly intensify in the Protohistoric Bronze Age that followed.

The Protohistoric Bronze Age

It is no exaggeration to say that the Protohistoric Bronze Age (ProBA) brought revolutionary changes to nearly every aspect of Cypriot society. While highly complex, state-level societies had

Cyprus, Archaeology of, Fig. 5 Plan of Marki-*Alonia*, Phase G, MC I-II (courtesy of David Frankel and Jennifer Webb)

emerged in Mesopotamia and Egypt during the fourth millennium BCE and by the early third millennium in Anatolia and the Levant, Cyprus had remained a mostly egalitarian, insular and village-based society until the transition to the Late Bronze Age. We then see the rapid development of social stratification, population growth, and agricultural intensification, elite control over specialized systems of production and exchange, the appearance of the first cities and monumental architecture, and the development of the as yet undeciphered Cypro-Minoan script (Knapp 2013: 348–447; for further reading see Ferrara 2012 and Karageorghis 2002).

Not all of these transformations occurred immediately, and it is possible to distinguish a Proto-urban phase lasting until the fourteenth century BCE. This period is characterized by the appearance of a series of forts at sites such as Ayios Sozomenos and Enkomi, which were the first large-scale monumental buildings on the island and likely constructed to control the nascent copper industry, including transportation routes from the copper mines in the foothills of the Troodos to newly emerging coastal centers in the north and east. In a distinct break from centuries of burial in extramural cemeteries, we also see the placement of chamber tombs in the open spaces between buildings at Proto-urban Enkomi. The visibility and continued reuse of these tombs throughout this period indicates that they were the primary means of status display among competing groups (Keswani 2004: chap. 5) and used in the negotiation and demarcation of both physical and social boundaries between them.

This was followed by a fully urban phase (LC IIC-IIIA periods) that witnessed the (re)construction or urbanization of a number of settlements, particularly in the southern coastal region, although this played out along different trajectories. While sites such as Enkomi and Kalavasos-*Ayios Dhimitrios* show clear evidence of nucleated urban planning with contiguously placed buildings on street systems that followed an orthogonal grid (Fig. 6), others, such as Maroni, appear to have had a lower-density urban form dispersed over multiple nuclei (e.g., Manning et al. 2014). New types of houses were woven into this ProBA urban fabric, which were rectilinear, but, in contrast to their PreBA predecessors, tended to have more standardized forms (often court-centered or L-shaped) and were much larger with many more individual spaces. The new houses both produced and reflected an intensification of more specialized divisions of labor that began in the PreBA based on gender, age, and other factors. While the household continued to be an important unit of social and economic production, its members became enmeshed in a multiplicity of suprahousehold social networks at various scales, from neighborhoods through various levels of community, which they drew on in the formation of individual and group identities (Fisher 2014).

In these new urban environments, monumental buildings constructed using ashlar (cut stone) masonry provided venues for competitive feasting and other ritual activities during which statuses and identities were displayed and negotiated, replacing the funerary realm as the primary social arena (Fisher 2009). At Kalavasos-*Ayios Dhimitrios*, Maroni-*Vournes*, and Alassa-*Palaeotaverna*, this took the form of massive court-centered buildings, which appear to have been the administrative foci of their respective regions and yielded evidence for the large scale production and storage of agricultural goods, especially olive oil (Fig. 7). By contrast, no obvious single administrative focus has been recovered at Enkomi and a more heterarchical power structure may have existed there, as also suggested by the site's mortuary record (Keswani 2004: 93–98).

The new, mostly coastal, cities stood at the top of multitier, regional settlement hierarchies that included smaller inland sites engaged in production, administration, and transport, and specialized villages focused on agriculture, pottery production, or the mining and production of copper (Knapp 2013: 349–359). They were primary nodes in both local and interregional trade networks within Cyprus and long distance trade networks that connected the island to the wider Eastern Mediterranean world and beyond. Cities were also centers for the production and redistribution of a variety of specialized craft products,

Cyprus, Archaeology of, Fig. 6 Plan of Enkomi, c. 1200 BCE (drawn by Kevin Fisher)

although copper appears to have been the vital commodity in Cyprus's overseas exchanges. Control over its production underpinned at least in part the economic power of ProBA elites and was legitimized through ideological means (Knapp 2013: 371–2) – a strategy materialized in the bronze "Ingot God" statue found at Enkomi in the sanctuary that bears its name. Cypriot copper was widely distributed around the Mediterranean (and beyond) and typically shipped in the form of "oxhide" ingots (usually c. 25–28 kg in weight). Three-hundred and forty-eight such ingots, weighing nearly 10 tons, were part of the impressive cargo recovered from the Uluburun shipwreck, a late-fourteenth century BCE vessel likely headed for an Aegean port, which sank off the southern coast of Turkey near modern Kaş (Pulak 2010). Debate continues regarding the vessel's origin and the nature of the exchange represented by its cargo, although some form of elite- (if not royal-) directed exchange seems likely. Among the ship's cargo were numerous

Cyprus, Archaeology of, Fig. 7 The Pithos Hall in Building X, Kalavasos-*Ayios Dhimitrios* (LC IIC). Each stone base supported a large storage jar (*pithos*), likely containing olive oil, with a combined capacity of over 33,000 liters (photo by Kevin Fisher)

Cypriot ceramic vessels packed into large storage jars (*pithoi*), including distinctive handmade finewares such as White Slip and Base Ring, which have been recovered from sites around the Mediterranean.

These exchanges marked Cyprus's growing connectivity and engagement in an emerging LBA network that linked the island to other polities in a complex web of economic and political relations. Such interconnections were undoubtedly a significant factor in the rapid development of (ostensibly) state-level sociopolitical organization in the ProBA, but questions remain as to whether this took the form of an island-wide polity or series of regional polities, or vacillated between these configurations over the course of the LBA. Few would question the identification of Cyprus as the territory of *Alašiya* referred to in a number of Late Bronze Age textual sources, although it is uncertain if this refers to the whole island or only a particular city or region. The terms of address used in official diplomatic correspondences of the period, such as the mid-fourteenth century BCE Amarna Letters found in the capital of the Egyptian pharaoh Akhenaten (for further reading see Moran 1992), make it clear that the King of *Alašiya* was among the "great kings" of the period. These letters and the status they imply, in addition to the cultural homogeneity reflected in many aspects of the material record, are central to arguments that favor Cyprus being ruled as a unified, centralized state during much of the Late Bronze Age, or at least during the fourteenth–thirteenth centuries BCE (see Knapp 2013: 432–447). Others favor a more decentralized system, characterized by a heterarchical or corporate distribution of power in which the king was something of a "first among equals" representing the island's elite in international affairs (e.g., Peltenburg 2012).

The LBA system collapsed in the decades around 1200 BCE, a period of upheaval marked by the destruction or abandonment of a number of major centers and the disintegration of the highly centralized palace-based economies in the region. Based on the presence of locally made Mycenaean-style ceramics (particularly so-called Mycenaean IIIC:1b) and certain "Aegean" architectural features (e.g., large halls with central hearths), and bolstered by foundation legends associated with Homeric heroes, some scholars argue that there was an initial influx of colonists or refugees on Cyprus at this time, who left the Aegean region in the wake of the collapse of the Mycenaean palace system (e.g., Karageorghis 2000). These settlers are often equated with the enigmatic "Sea Peoples," who are thought to have played a key role in the disruptions and population movements in the region, including those that mark the LC IIC to IIIA transition on Cyprus. Proponents of this colonization model suggest that these events mark the beginning of the Hellenization of the island as the Greek settlers came to dominate the island culturally, if not politically,

by the early Iron Age, perhaps even earlier (e.g., Iacovou 2008). A number of scholars have taken issue with this model on archaeological grounds, arguing against simplistic "pots = people" concepts of ethnicity and some have also criticized its role in a broader Hellenocentric narrative aimed at legitimizing present-day political claims (e.g., Leriou 2007). While not discounting the likely presence of some Mycenaeans on the island, a stronger case can be made for viewing Aegean influences in ProBA material culture as the product of the hybridization or entanglement of Aegean with native Cypriot and Levantine elements in the context of growing socioeconomic interaction (e.g., Knapp 2013: 454–470). Explanations for the end of the LBA have moved away from unicausal models (such as the Sea Peoples), recognizing that climate and other natural disasters, the highly centralized and interconnected nature of the palatial economies, and intensified mobility all had roles to play in the "crisis years," but even a careful marshalling of the documentary, archaeological and scientific evidence (e.g., Knapp and Manning 2016) cannot yet explain the causes of events that played out over the course of decades throughout large areas of the Mediterranean.

Iron Age City-Kingdoms

By the start of the Iron Age, a period known as the Protogeometric (or LC IIIB), most of the Late Bronze Age centers were destroyed and/or abandoned, yet cultural continuity is seen in a number of areas, including pottery styles and production, architecture, metallurgy, and religious practices (Iacovou 2008; Knapp and Manning 2016: 134). Indeed, Cyprus fared better than many regions and the disruptions of the period were relatively short-lived as the ProBA system was replaced with the emergence of a new sociopolitical landscape defined by city-kingdoms. While occupation continued at Kition (Smith 2009), Palaepaphos, Enkomi (moved to nearby Salamis) and Idalion, a number of new centers were founded at sites such as Soloi, Lapithos, and Marion – settlements that would all later become the centers of Iron Age kingdoms. Most evidence from this period comes from the burial record, however, as extramural cemeteries with family-oriented tombs once more became the norm. The cultural, social, and political developments of the Early Iron Age have typically been explained in terms of the presence and influence of new ethnic groups. For proponents of the aforementioned Aegean colonization model, the Greek population, bolstered by additional immigration at this time become culturally dominant in the Cypro-Geometric (CG) period, reflected in Aegean-inspired pottery, tomb types, and the introduction of Greek language and political institutions. Phoenicians also arrived on the island, perhaps as early as the eleventh century BCE, eventually establishing a colony at Kition from which they too were able to exert economic and cultural influence (see Janes 2010: 128–130). These foreign cultures (particularly the Greek) are seen to absorb a less complex and gradually acculturated native "Eteocypriot" culture, while providing the impetus for state formation (see Knapp 2013: 454–470 for a more detailed discussion).

New approaches to understanding the sociopolitical developments of this period have moved away from problematic discussions of the ethnicity of material culture and focus instead on the complex external and intra-island interactions of these and other groups that created the hybridity seen in the mortuary record, iconography, and built environment of this period (Counts 2010; Janes 2010; Kearns 2011). Although often cited as evidence for Greek colonization and sociopolitical preeminence, the bronze *obelos* (skewer) inscribed with the Greek name "Opheltas" found in Tomb 49 at Palaepaphos-*Skales* embodies the hybridized nature of Iron Age material culture on the island. Not only is the act of inscribing one's name on an object a Levantine and Cypriot practice, but the artifact is a distinctly Cypriot type and the Greek name is written in the Cypro-syllabic script used on the island throughout much of the Iron Age (Sherratt 2003).

Janes (2010) argues that burial practices at each of the major CG centers reflect different strategies of social organization and interaction by which they became kingdom centers. While the placement of tombs around Palaepaphos was intended to project the community's identity to the

outside world, the first burials among the "Royal" Tombs at Salamis during the late CG announced the emergence of a ruling lineage to the local population, a process facilitated by successful competition for both island resources (particularly copper and timber) and control of increasingly lucrative trade links with the eastern Mediterranean. This culminated with Tomb 79, dated to the CG III/CA I, with its evidence of elaborate funerary ritual and conspicuous consumption performed in its wide, sloped, ashlar-lined *dromos* (entryway). This included the sacrifice of horses in full harness with their chariots and the interment of impressive ivory-inlaid furniture and a bronze cauldron with griffin protomes (Karageorghis 1973) – hybridized funerary practices and material culture that referenced Greek, Near Eastern, and Egyptian exemplars. These various processes saw the emergence of a number of city kingdoms throughout the island by the Cypro-Archaic Period (700–400 BCE). From this point forward, a wider range of historical and epigraphic sources are available to help elucidate the picture provided by archaeology.

It is unclear precisely how many Cypriot city-kingdoms existed at any given time, although several are attested in textual sources from the Neo-Assyrians, the first of the great first millennium BCE Near Eastern empires to exert some form of nominal control over the island. A stele from Kition commemorates the 707 BCE submission of seven unnamed kings of Cyprus to Sargon II, while the Prism of Esarhaddon (613/2 BCE) lists ten cities and their rulers, including Idalion, Chytroi, Palaepaphos, Kourion, Tamassos, Ledra, Salamis, and Soloi, while two others, Qartihadasti and Noure, remain unclear (Iacovou 2008: 642–643). The island was largely Greek-speaking by this time (Iacovou 2008: 640), although hybridity continued to be a characteristic trait of its material culture – a combination of local creation and foreign stimuli that arrived through growing long-distance exchange and outside political control as the island became an important node for the transition of innovations between the Greek and Near Eastern worlds. Despite some regional variations (seen especially in ceramic decoration and sculpture), there was general "material homogeneity" on Cyprus during the period of the city-kingdoms, indicating a shared cultural system (Papantoniou 2012: chap. 3).

The kingdoms were typically characterized by a fortified urban center and surrounding hinterland. Urban and extramural sanctuaries dedicated to local gods and Cypriot variants of Greek and Near Eastern deities were especially important elements of the Iron Age landscape, playing an active role in the definition and organization of political space, the negotiation of social relationships, and the formation of religious, cultural, and political identities (Counts 2010; Papantoniou 2012). Some, like the Sanctuary of Aphrodite at Palaepaphos became internationally famous. Based on the archaeological and textual records, Cypriot kings (*basileis*) likely held wide-ranging political, military, socioeconomic, and probably religious control over their territories (Counts 2010: 141–143). While most people were buried in rock-cut chamber tombs, ruling dynasts and other high ranking elites often built impressive tombs using ashlar masonry, as seen in the royal necropolis at Tamassos. The palaces of the Archaic and Classical rulers are known mainly from Amathous and Vouni and a recent reassessment of the palace at Vouni, built in c. 500 BCE during the period of Persian rule, demonstrates how its layout, construction, and renovation used hybridized architectural forms that marked the complex as a critical site of local sovereignty, while simultaneously tying its builders to larger currents within the eastern Mediterranean (Kearns 2011).

Interrelations among the Cypriot kingdoms were rarely amicable and their political ambitions and rivalries were occasionally resolved militarily as seen in the annexation of Idalion by Kition in 470 BCE. During the late Cypro-Archaic and Cypro-Classical periods the kingdoms became directly embroiled in the wider struggles between the Greeks and the Persian Empire. Following a possible brief period of Egyptian rule, the Cypriot kingdoms submitted to the Persians in 545 BCE but largely retained their independence. In 499 BCE all except Amathous joined the Greek side in the Ionian revolt and were defeated by a Persian force who lay siege to several cities. As

the conflict between Persia and Greece continued, allegiances were divided as some Cypriot rulers resisted the Persians, while others took a pro-Persian stance. The Greeks, under the leadership of Athens, made a number of unsuccessful attempts to liberate the island and, in spite of the efforts of Evagoras I of Salamis to gain control of the island with Athenian help in the early fourth century BCE, it remained under Persian control until the conquests of Alexander the Great.

Age of Empires: Hellenistic and Roman Cyprus

After Alexander's death in 323 BCE, his successors fought for control of his short-lived empire and the Cypriot *basileis* were divided between the Antigonids and the Ptolemies. Cyprus, highly desired for its strategic location, rich copper and grain resources, and timber for ship building, eventually fell to Ptolemy I. After a brief period of Antigonid rule starting in 306, Ptolemy regained the island in 294 BCE, beginning a 250-year period of nearly unbroken control. There is no further mention of the city-kingdoms or their rulers after 306, a situation corroborated by numismatic evidence as local rulers could no longer mint their own coinage. Papantoniou (2012: 11) argues that, despite the imposition of a unified state, the administrative functions of Cypriot cities likely continued at least through the third century BCE. The Ptolemies eventually installed a *strategos* (governor-general) who was a member of the royal court in Alexandria and directly responsible to them. The administrative system was reorganized at the end of the third century BCE, imposing a unifying administrative system backed by a state ideology linked to the royal cult and, based on epigraphic evidence, a court like that of Alexandria may have existed on Cyprus at this time (Papantoniou 2012: chap. 4). It is notable that many of the extra-urban sanctuaries that had played such an important role in local politics, territorial definition, and identity formation during the period of the city-kingdoms began to fall into disuse after this time. The result of these changes was a more unified cultural and religious system in relative conformity with wider the Hellenistic *koiné* (Papantoniou 2012: 360).

Little public or domestic architecture from the Hellenistic period has been recovered, much of it having been obscured by later Roman construction or destroyed by the severe earthquakes of the first centuries BCE and CE. The capital was moved to Nea Paphos in the second century BCE as part of the administrative restructuring of the island. Ongoing excavations and survey by both Cypriot and foreign teams suggest that, from its founding in the fourth century BCE, the town was built on an orthogonal plan with well-defined commercial and residential areas, as well as a c. 8000-seat theater, agora, and city walls (Balandier 2016; Młynzarczyk 2016). While rock-cut chamber tombs continued to be the norm for many non-elite Cypriotes, the so-called Tombs of the Kings cemetery in the *Palaeokastra* locality at Nea Paphos demonstrates how local elites drew on Alexandrian exemplars in the construction of a monumental funerary landscape. The most impressive examples of these subterranean, rock-cut tombs include the use of a peristyle court with Doric-style columns and architectural elements of stuccoed and painted limestone (Fig. 8).

The eastward expansion of the Romans in the first century BCE, coupled with the declining power of the Ptolemies, led to the annexation of Cyprus by Rome in 58 BCE. Following the battle of Actium, Julius Caesar's heir Octavian (soon to be given the title *Augustus*) was left sole ruler of Rome's vast empire. Cyprus was initially added to the province of Syria, under Augustus's direct control, but was soon made a senatorial province governed by a senate-appointed proconsul. Nea Paphos initially continued as the island's capital and excavations in the *Maloutena* locality have revealed a residential area with a number of Roman urban villas with impressive mosaic floors, including the massive second century CE Villa of Theseus, a *villa publica* that likely served as the proconsul's official residence. The Hellenistic street grid was retained at least until the rebuilding of the city following an earthquake, likely during the reign of Hadrian in the early-mid-second century CE (Młynzarczyk 2016: 35). This rebuilding included the construction of an Odeon and Asklepieion adjoining a new

Cyprus, Archaeology of, Fig. 8 Tomb 3 peristyle with Doric columns; "Tombs of the Kings," Nea Paphos (*Palaeokastra*); Hellenistic, third century BCE (photo by Kevin Fisher)

colonnaded agora. The island flourished under the so-called *Pax Romana* and cities like Nea Paphos and Salamis benefitted from imperial patronage. The Roman civic and domestic architecture still visible at Kourion, Nea Paphos, and Salamis remain some of the island's most impressive archaeological monuments and are testament to its relative prosperity during the early empire. Current approaches to the archaeology of Roman Cyprus have taken up the critique of "Romanization" seen elsewhere in Roman studies, emphasizing Cypriot agency through connectivity and participation in local and long-distance exchange networks (e.g., Lund's [2015] study of Hellenistic and Roman ceramics), as well as the production of local insular identities expressed through Cypriot material culture, such as the hybridized Temple of Apollo Hylates at Kourion, whose polyvocal design incorporated Roman, Cypriot, and Near Eastern elements (e.g., Gordon 2018).

The island would not truly regain its independence until 1960 as its strategic position ensured its incorporation into an almost unbroken succession of empires and colonial powers, each of which left its own traces on the Cypriot landscape. Yet, this was not a process of passive reception on the part of the island's inhabitants. Rather, as the foregoing account demonstrates, the Cypriotes actively shaped these encounters, adapting foreign influences to local circumstances and creating a unique, vibrant, and fascinating culture in the process.

Key Issues and Current Debates

The foregoing account also raises a number of significant issues that continue to spark debate and influence the direction and scope of archaeological research on Cyprus. The origins and timing of the island's first episodes of visitation and colonization and the interactions of its first inhabitants with the mainland during the Neolithic period are undoubtedly some of the key questions archaeologists are now trying to address. The interplay of indigenous developments and foreign influences at several key transformations in the Cypriot past (e.g., the Chalcolithic to Early Bronze Age, the origins of the Late Bronze Age, and the transition to the Early Iron Age) and their implications for identity formation are vital areas of research and debate. The adoption of post-processual approaches by some scholars has seen critical examinations of the role of modern

politics and colonial legacies in the interpretation of the island's archaeological record (e.g., Knapp and Antonidou 1998; Leriou 2007; various papers in Tatton-Brown 2001). Indeed, one cannot discuss the archaeology of Cyprus without consideration of its current political situation, which continues to have a profound effect on our understanding of the island's past. Growing tensions between Greek and Turkish Cypriotes following independence culminated in 1974 with a short-lived *coup d'état* by pro-*Enosis* (union with Greece) forces and an invasion of the northern part of the island by Turkey. In the wake of these events, Cyprus became partitioned along ethnic lines. The government of the largely Greek south (the Republic of Cyprus) is recognized by the international community as the island's legitimate regime, while the self-declared Turkish Republic of Northern Cyprus is recognized only by Turkey, who maintains a substantial military presence in this territory. The result has been a cessation of "officially sanctioned" archaeological work in the north since 1974, and what work that has taken place there is not well reported. Perhaps more worrisome is the fact that some cultural objects and sites in the north have been subject to neglect, theft, and, in some cases, purposeful damage and destruction (Knapp and Antoniadou 1998: 24–29). Consequently, there are now significant gaps in our knowledge of this important region, which has been largely disengaged from mainstream archaeology and the systematic application of advancements in archaeological method and theory seen on the rest of the island over the last few decades.

Future Directions

The future scope of archaeological inquiry will obviously depend on whether a solution can be found to the "Cyprus Problem." Regardless of the outcome of this thorny issue, increasing pressures of development, spurred in no small part by the tourism industry, will present a difficult challenge for archaeologists working on the island and particularly for the Department of Antiquities as the government body charged with protecting the island's cultural heritage. In response to this situation and current trends in archaeological data collection, scientific methods for detection (e.g., archaeological geophysics, terrestrial, and aerial remote sensing), recording and analysis at various scales will need to play an increasingly important role in the investigation and conservation of Cyprus's archaeological record. Growing engagement with the critical perspectives of post-processual archaeology, which has spurred fruitful research on issues of gender, identity, agency, power, and materiality, will undoubtedly continue. This includes an emphasis on the perspectives of "island archaeology" and concepts such as *islandscape* and *coastscape*, which are essential to understanding ancient Cypriotes' relationships with the surrounding sea and the important role of insularity and connectivity in identity formation and change through time (see Knapp 2013: 34–37). Introspection on the practice of Cypriot archaeology itself and its political entanglements in the past and present will also continue and the discipline will unquestionably play a key role as Cyprus grapples with issues of heritage management and identity thrown into relief not only by its current political and ethnic division, but also by its accession to the European Union and the growing pressures of economic development and immigration.

Cyprus: Cultural Heritage Management

Anthi Kaldeli
Archaeological Research Unit, Department of History and Archaeology, University of Cyprus, Nicosia, Cyprus

Introduction

The factors that have affected the Cypriot culture diachronically are the island's strategic

geographical position in the eastern Mediterranean, its central role in the interactions and exchanges taking place in the broader region, and its natural prosperity. These specifications have made the island a place where cultural traits from different civilizations are encountered. Based on archaeological evidence, it is believed that these interactions, together with endogenous factors, lead to the emergence of Neolithic settlements and the development of complex social structures already from the Bronze Age. The island's rich natural resources and centrality in the eastern Mediterranean basin continued to determine its history in the following periods, evidenced in the variability characterizing the material culture, as developed within each period's sociopolitical, economic, and ideological framework. As evidenced in the archaeological record, due to its island-specific traits, and as a crossroad between the eastern and western Mediterranean, Cyprus played a crucial role in the diachronic exchange of ideas and the transfer of information among diverse civilizations. Continuous occupation from prehistoric times resulted in the existence of numerous archaeological sites throughout the island and the need to provide protection and promotion of cultural heritage.

The character of Cultural Heritage Management in Cyprus is strongly linked to the modern history of the island and the establishment of the Department of Antiquities in 1935. Given the significant historical and archaeological background of Cyprus, extending from the Paleolithic to the Ottoman period, and its rich folk heritage, Cultural Heritage Management developed into a vital sector of the Republic of Cyprus, established in 1960. Most importantly, it became a milestone in the promotion of tourism, economic development, and the reinforcement of cultural identity. Nevertheless, Cultural Heritage Management only involves the south area of the island, as a result of the Turkish invasion of 1974 and the loss of control over many important monuments and archaeological sites, situated in the occupied northern area. This section aims at giving a brief account of the definition of Cultural Heritage Management in Cyprus and the broader factors that affected its development. It will also focus on the key issues governing the structured actions in order to understand its scope and the underlying factors.

Definition

Cultural Heritage Management on Cyprus, practiced by the Department of Antiquities, primarily involves the protection, restoration, conservation, and promotion of classified sites, monuments, and artefacts, such as mosaics, frescoes and icons. It also involves the establishment, management, and operation of archaeological museums and the control of private collections. Its operation falls within the realm of the two sectors (Ephorates) of the Department of Antiquities: the sector responsible for the Ancient Monuments and the sector responsible for the operation of Archaeological Museums. It also encompasses the government's efforts against the looting of the island's cultural heritage primarily, as a result of the Turkish occupation of the northern area of the island.

As portrayed in the Antiquities Law (Cap. 31),

> antiquity means any object, whether movable or part of immovable property which is a work of architecture, sculpture, graphic art, painting or generally any form of art which has through human effort been produced, sculptured, inscribed, or painted or generally made in Cyprus earlier than the year 1850A.D. in any manner whatsoever and from any material and which has been found, discovered or excavated in Cyprus or recovered from the sea within the territorial waters of Cyprus and includes any such object or part thereof which has at a later date been added, reconstructed, readjusted or replaced subsequently.

According to this legal statement, Cultural Heritage Management on Cyprus is particularly engaged with the protection of the antiquities falling within the above categories.

Cultural Heritage Management on Cyprus is tightly affiliated with its modern history, and in particular with the British Colonial period (1878–1960) of the island. In fact, the establishment of the Cyprus Museum in 1882 was the result of the reaction of locals against the illicit excavations and the smuggling of antiquities from the island. According to the Ottoman Law on Antiquities of 1874, one third of the

excavated antiquities belonged to the Government, one third to the owner of the land, and the remaining third to the excavator. It is worth noting that the British maintained this law for over 20 years, while many excavators, taking advantage of the legal status and the poverty prevailing on the island, bought the land in order to posses the two thirds of the excavated antiquities. The Antiquities Law was enacted in 1905, during the British Colonial period, with an amendment in 1927, regarding the exportation of antiquities. The enactment of the new Antiquities Law in 1935 coincides with the establishment of the Department of Antiquities as a governmental organization, and the abolition of the previous Museum Committee.

The establishment of the Department of Antiquities is associated with the conduct of large-scale systematic excavations, which were to increase following the independence of the island in 1960. It is the intensification of excavations which largely determined the development of management of archaeological sites, reflected in the Antiquities Law of 1935 and the subsequent amendments. The establishment of the management of cultural heritage, however, was significantly triggered by the severe destruction of archaeological sites and antiquities caused by the Turkish invasion in 1974. Archaeological research on the occupied northern area of the island ceased, and archaeological sites and monuments, including churches and museums, remained neglected, or suffered violations. These new circumstances imposed the adoption of new strategies regarding the protection of Cypriot cultural heritage. Yet, Cyprus still became a central focus for international archaeological research, resulting in the great increase of excavations undertaken by foreign missions in the non-occupied area. The economic recovery of Cyprus following the disaster of 1974 and the role of tourism in the economic development bestowed a new role to the Cultural Heritage Management of the island.

In essence, it is the totality of the aforementioned circumstances that affected and eventually formed the character of Cultural Heritage Management on Cyprus, envisaged in the efforts for revealing, protecting, and promoting the remains of the island's important ancient past. The mechanisms employed for the management of cultural heritage can be traced in the Antiquities Law of 1935. Together with the subsequent amendments, the Antiquities Law, alongside the Regulations, still regulates the Cultural Heritage Management in Cyprus.

Key Issues

The key issues of Cultural Heritage Management, encompassed in the Antiquities Law of Capital 31, are summarized into owning property in antiquities, the accidental discovery or disposal of antiquities, aspects relating to the Ancient Monuments, including the declaration of Ancient Monuments and compensation, and the legal status of the conduct of excavations. Further issues involve the control and management of museums and advisory bodies, the antiquities to be held in them, rent control, and tax exemptions. The broader category of Miscellanea (Part VIII) includes crucial aspects, such as the licensing of dealers, the export of antiquities, loans of antiquities outside the Republic of Cyprus, immunity from criminal liability, disposal of forfeitures, extension of criminal jurisdiction of criminal court, regulations, and saving of license.

The emphasis put on classified monuments in the island's Cultural Heritage Management is reflected in the extensive legislation governing their regulation in the Antiquities Law. In particular, monuments are classified as "Ancient Monuments" and are distinguished into the so-called First and the Second Schedule of the Antiquities Law. Ancient Monuments in the First Schedule refer to plots belonging to ancient sites, therefore encompassing antiquities, and their surrounding area. In these cases, the land is expropriated and the owners are compensated, as it comes under the ownership of the Republic of Cyprus. This mechanism constitutes the basic tool for the protection and promotion of archaeological sites, as it defines their boundaries, therefore preventing any actions inhibiting their potential destruction or endangerment.

Ancient Monuments in the Second Schedule of the Antiquities Law involve plots that are controlled by the Republic of Cyprus but are, nevertheless, under the possession of the legal private owners. A plot may be declared into the Second Schedule, once there is surface evidence or it is suspected, based on contextual evidence, that it may encompass antiquities, or if the plot is in proximity with an archaeological site. Following the declaration of a plot into the Second Schedule, the owner is obliged to have the permission of the Department of Antiquities to proceed with any kind of activity within the plot. In these cases, activities are supervised by the Department of Antiquities. In the cases in which ancient remains are found, the Department of Antiquities commands the cessation of the work and proceeds with the expropriation of the plot, which is thereafter declared into the First Schedule. Ancient monuments in the Second Schedule of the Antiquities Law also encompass religious monuments, which are excluded from expropriation.

To an extent, Cultural Heritage Management on the island is determined by the conventions signed by the Republic of Cyprus, which place it within a wider, European or international, framework sharing common objectives and structures. The signing of the European Cultural Convention of 1954 has set the principles toward the management and protection of a common European heritage and culture. Certain signed conventions and international binding treaties, such as the Hague convention of 1954 (Article 9 of the second Protocol for the protection of Cultural Property in the Event of Armed Conflict), stemmed from the current political situation on the island and the need to secure the safety of cultural heritage. Other signed conventions include the Granada Convention of 1985, the Valetta European Convention of 1992, the Paris conventions of 1972 and 2003, the Rome Convention of 1995, the Statutes of the International Centre for the Study of the Preservation and Restoration of Cultural Property (ICCROM), and the charters for the Protection and Management of the Archaeological Heritage (Lausanne 1990) and for the Conservation of Historic Towns and Urban Areas (Washington 1987). The Memorandum of Understanding between the Government of the United States of America and the Government of the Republic of Cyprus, concerning the imposition of import restrictions on preclassical and classical archaeological objects, and Byzantine period ecclesiastical and ritual ethnological material aims at impeding the looting of cultural heritage occurring on the island. More recently, Memorandum of Understandings concerning the protection of cultural heritage, have also been signed with the government of the People's Republic of China (2008), the Russian Federation (2010), and the Palestinian National Authority (2011), while a Bilateral Agreement exists with Switzerland (2011) and a Memorandum of Cooperation with the Government of the State of Israel (2011).

Furthermore, the inclusion of certain sites in the UNESCO World Heritage list has formed the basis for the introduction of measures for the protection of archaeological sites and the establishment of management plans and reporting systems on the state of their conservation. The fact that the archaeological site of Paphos was included in the UNESCO World Heritage list in 1980 (Karageorghis 2002), the Medieval painted churches of the Troodos region in 1985, and the prehistoric site of Choirokoitia in 1998 best demonstrates that the establishment of management strategies is a fairly recent development. The recent management plans of Choirokoitia are part of the Participation Programme of UNESCO, 2011.

The national committees of UNESCO and the International Council on Monuments and Sites (ICOMOS) in Cyprus act as recommendatory boards. The actions and decisions, nevertheless, concerning the management of archaeological sites, and the strategies that should be employed in their conservation and presentation to the public, remain with the Department of Antiquities.

A decisive factor affecting the management of cultural heritage in Cyprus is recent building expansion, which is the result of economic development. The present-day situation on the island imposes the need to secure the surroundings of archaeological sites and monuments through the inclusion of plots into the First and Second Schedule of the Antiquities Law. These pressures also

often lead to incomplete excavations resulting in the loss of important information. Furthermore, the problem becomes even greater when large-scale systematic excavations are conducted in urban centers, and especially in sites that belong to development projects. The archaeological sites on the Hill of Agios Georgios (PA.SY.D.Y.) and at the so-called Palaion Demarcheion, both in the island's capital, Nicosia, constitute such examples.

The first site, proposed to house the new House of Representatives, is the ancient predecessor of Nicosia. As such, it provides evidence on the character of successive periods, from the Archaic to the Hellenistic, previously lacking from the city's history, although phases from other periods are also apparent. The latter site, destined to house the new town hall, is also important as it elucidates hitherto obscured aspects of the Byzantine period, including town planning, architecture, and everyday life. It covers a period from the eleventh to the nineteenth century. It is the only large-scale excavation in the city's historical center, within the medieval walls. In both cases, the delays in the final decision-making concerning the plans and the future of the sites, severely put the ancient remains at risk as they are exposed in the elements, despite the efforts of the Department of Antiquities to proved annual conservation. Both archaeological sites have been included in the ICOMOS World Report 2006/2007 (Petzet and Ziesemer 2006/2007), following intense efforts on behalf of the Department of Antiquities.

The Department of Antiquities, in an attempt to develop further the management of archaeological sites, has established collaborations with prestigious organizations from abroad, such as the Courtauld Institute. Such endeavors are also reflected in an older collaboration with the Getty Conservation Institute (1987–1991), involving the conservation of the mosaics of the archaeological site of Paphos.

Further key issues involve the destructive consequences of the cultural heritage of the northern area of the island, following the Turkish invasion of 1974 (Jansen 2005). Apart from the destruction of archaeological sites and monuments, including churches (Papageorghiou 2010), an unknown number of antiquities, including items of Byzantine art, were illegally exported from the island, while museums were also looted. The recent interactions between the Turkish-occupied area and the area controlled by the Republic of Cyprus, following developments in the political sphere, have resulted in a new trend concerning illicit trafficking, as looted antiquities are illegally transferred throughout the island to be sold. The Department of Antiquities makes great efforts to control and reverse this situation, through the international binding treaties and conventions for the protection of cultural heritage in events of armed conflict and military invasion. It also follows the world trade of antiquities in an attempt to imbed the illicit trade of looted artifacts. Toward this objective, the Department of Antiquities has included special references on its official website, in order to notify the world regarding the destruction of cultural heritage and the sites or museums involved. Furthermore, the policy of the Ministry of Foreign Affairs of the Republic of Cyprus, and of Cypriot embassies abroad, encompasses the dissemination of the grave problem of heritage destruction in the occupied territories. In relation to this issue, the Church of Cyprus has contributed immensely in the protection of monuments in the occupied part of the island and the repatriation of objects of cultural heritage, as has the A.G. Leventis Foundation, through the retrieval and purchase of looted objects in international auctions.

The Department of Antiquities also works in collaboration with foreign museums and particularly with UNESCO, as well as the Council of Europe, ICOM, ICOMOS, and Europa Nostra, in order to address this problem. The return in 1983 of the mosaic medallions depicting Apostles that were looted in 1979 from the church of Panagia Kanakaria in the occupied village of Lythrangomi, via Germany, constitutes an example of the important, but, nevertheless, sparse circumstances in which the resilient efforts against the destruction of cultural heritage through looting were fruitful. Further pieces from these mosaics were retrieved and returned to Cyprus in 1991 and 1997, respectively. Other attempts to raise public awareness

and promote the need to protect the occupied archaeological sites include the publication of a book by ICOMOS Cyprus National Committee regarding the destruction and the illicit excavations currently conducted on the important occupied archaeological site of Salamis. Salamis was an archaic and classical kingdom, which also thrived in the Hellenistic and Roman period and became the capital of the island in the early Christian period.

For the dissemination of knowledge regarding Cypriot antiquity, a digital catalogue (CADIP) is currently being developed by the Department of Antiquities that will manage information, ranging from the finds excavated in various sites to excavation and survey data, including maps, and archival information. Moreover, the first web-page concerning archaeological finds, stored in the Cyprus Museum, has recently been established, enabling students and researchers to examine an important part of the material culture of a site situated in the occupied area of the island. It involves the archaeological finds from the tombs in Enkomi, excavated by the British Museum at the end of the nineteenth century. The innovations inaugurated with this project have set the basis for the digital unification of archaeological assemblages, part of which has in the past been transported to museums abroad.

Current Debates

The Need to Further Develop Cultural Heritage Management

Despite the efforts of the Department of Antiquities to adequately manage cultural heritage on the island, the operation of this governmental body is based on the structures set during the British Colonial period, or at the genesis of the Republic of Cyprus. This is enough evidence for the changes that must occur in order to be in pace with the modern conditions prevailing on the island and in the broader region, as well as with current scientific developments. It is vital to adopt a more dynamic approach that will be based on a solid theoretical and methodological framework, following the principles of the discipline of Cultural Heritage Management. On this basis, the future agenda should also encompass the Intangible Cultural Heritage (Μπακιρτζής 2006). Furthermore, it is equally vital to incorporate approaches associated with "red-zones"; with the prospect of a solution being reached between the Greek and Turkish Cypriot communities, a new and more complex situation will arise, which must be taken into consideration.

The salience of this issue and the necessity to establish an infrastructure for an adequate supervision of Cultural Heritage Management have led the Department of Antiquities to propose changes in its administrative and management framework, through reconsidering the sectors in which it operates. On this basis, it is setting new directions for achieving radical modifications in order to adjust with the current circumstances and address the overwhelming pressures imposed upon the management of cultural heritage by the increasing estate development.

To this end, it is pertinent to increase the scientific staff of the Department of Antiquities with scientists specializing on different fields of cultural heritage, including architecture, conservation, and museum studies. It is also important to employ archaeologists specializing on particular areas of archaeology, in order to enhance the ability to evaluate the increasing archaeological evidence within the context in which they were produced, circulated, and used or consumed. Given the increasing construction development and the international economic crisis, this simple, albeit crucial, mechanism will enable the establishment of specialized boards responsible for the evaluation process of the plots that need to be expropriated due to their archaeological importance. As a result, this measure will reinforce the protection of urban and rural archaeological sites, and their surrounding areas, as modern conditions increasingly coerce the Department of Antiquities to redefine their boundaries in order to adjust with regional economic development and growth. It is also essential to increase the technical staff, and to develop further the use of technology for cataloguing and promoting cultural heritage. A step toward this direction has been achieved through collaborations between the Department

of Antiquities, on one hand, and the Cyprus University of Technology, the University of Cyprus, and the Cyprus Institute, on the other.

Another important step to further secure the protection of cultural heritage is to proceed with concrete amendments of the Antiquities Law and its Regulations that would be in accordance with the legislation of the European Union. Such amendments would provide a solid basis against the illicit trafficking and looting of all antiquities, and not solely of those produced on the island. The definition of the existing law stems from past interpretations of the archaeological record; it therefore ignores recent scientific advances relating to the importance of trade and interactions throughout antiquity that result in the identification of ancient artifacts in areas other than their origins.

The line followed by the Department of Antiquities for the promotion of the Cypriot cultural heritage also involves the establishment of new premises for the Cyprus Museum and the upgrading of Provincial Archaeological Museums. A new building for the Cyprus Museum would enable the reassessment of Cypriot antiquity as evidenced in newly identified archaeological assemblages. It would also enable the display of archaeological finds based on recent approaches advocated by the discipline of Museum studies. Despite the inherent difficulties for a swift achievement of this objective, the Department of Antiquities, in an attempt to advance Cultural Heritage Management on the island, based on recent principles of the discipline, has established thematic museums. Such museums include the museum of the Mycenaean colonization of Cyprus, the Ethnological Museum in Nicosia, the Folk Art Museum at Geroskipou, the Rural Museum at Fikardou, and the Museum of Traditional Embroidery and Silver-Smith work at Lefkara. Furthermore, thematic exhibitions are occasionally organized in Cyprus and abroad for the promotion of particular fields of the Cypriot cultural heritage. The educational programs introduced in recent years, in collaboration with the Ministry of Education and Culture, aim at tutoring the civilians at a young age concerning the importance of cultural heritage and thus encourage its preservation and protection. Toward this objective, free tours are organized to monuments and provincial museums. Yet, it is commonly agreed that for the effectiveness of the above activities it is pivotal to employ archaeologists specializing in particular fields.
